A FEW OF THE

LEADING ARTICLES

IN VOLUME FOUR

Written and Signed by Specialists

CANADA, DOMINION OF ..... HIS GRACE THE DUKE OF ARGYLE

CANNING INDUSTRY IN AMERICA ..... E. S. JUDGE
Secretary National Association of Canned Food Packers

CANON LAW ..... P. A. BAART, S.T.L., LL.D.
Author of 'Church and State in the United States of America'

CAR BUILDING INDUSTRY ..... W. J. MCBRIDE
Vice-President American Car and Foundry Company

CARPET INDUSTRY IN AMERICA ..... SHEPPARD KNAPP
Of Sheppard Knapp & Co., New York

CARRIAGE AND WAGON INDUSTRY ..... CHAUNCEY THOMAS
Of Chauncey Thomas & Co., Boston

CASH REGISTER ..... HENRY S. HALLWOOD
Hallwood Cash Register Co., Cleveland, O.

CASH REGISTER INDUSTRY ..... A. A. THOMAS
Secretary National Cash Register Co.

CATHOLIC CHURCH, BENEFICENT EFFECTS OF THE
JAMES, CARDINAL GIBBONS

CATHOLIC CHURCH, ROMAN ..... JOHN J. WYNNE, S.J.
Editor of 'The Messenger'

CAVALRY ..... GEN. W. H. CARTER
Army War College, Washington, D. C.

CAVE ANIMALS ..... ALPHEUS S. PACKARD
Brown University, Providence, R. I.

CELTIC LANGUAGES, THE ..... JOSEPH FITZGERALD
Author of 'Word and Phrase'

CEMENT ..... SAMUEL SANFORD
Associate Editor 'Engineering and Mining Journal'

CENSUS ..... WILLIAM R. MERRIAM
Superintendent Twelfth Census

CENTRAL AMERICA ..... MARRION WILCOX
Authority on Latin-America

CERAMICS ..... CHARLES F. BINNS
New York State School of Ceramics

CHALK ..... ROBERT THOMAS HILL
Of the United States Geological Survey

CHANCELLORSVILLE, BATTLE OF ..... GEN. E. A. CARMAN
Of the United States War Department

CHANNING, WILLIAM ELLERY ..... OSCAR FAY ADAMS
Editorial Staff 'Encyclopedia Americana'

CHARITIES, PUBLIC ..... JOHN W. KELLER
Ex-Commissioner of Charities, New York

CHARLESTON, S. C. ..... HENRY TUPPER
Secretary Chamber of Commerce

CHARTER OAK ..... ALBERT C. BATES
Librarian Connecticut Historical Society

131564

CHATTANOOGA, BATTLE OF ..... GEN. H. V. BOYNTON
Of the United States War Department

CHATTANOOGA, TENN. ..... B. L. GOULDING
Vice-President Chattanooga Library Association

CHEMICAL ANALYSIS ..... A. D. RISTEEN
Editorial Staff 'Encyclopedia Americana'

CHEMICAL INDUSTRY, THE ..... HENRY BOWER
Of Henry Bower & Son, Manufacturing Chemists

CHEMISTRY ..... F. W. CLARKE
Chemist for United States Geological Survey

CHEMISTRY IN HUMAN PROGRESS ..... PETER T. AUSTEN
Late Professor Chemistry, Rutgers College

CHICAGO ..... HARRY PRATT JUDSON
Dean of the University of Chicago

CHICKAMAUGA, BATTLE OF ..... GEN. H. V. BOYNTON
Of the United States War Department

CHILD LABOR ..... HUGH F. FOX
President New Jersey State Board of Children's Guardians

CHILE OR CHILI ..... MARRION WILCOX
Authority on Latin-America

CHINA AND JAPAN ..... WILLIAM ELLIOT GRIFFIS
Author of 'The Mikado's Empire' and 'America in the East'

CHINESE ARCHITECTURE AND ART ..... RUSSELL STURGIS
Author of 'Dictionary of Architecture'

CHOLERA ..... H. H. BIEDLER, M.D.
Dean Baltimore University School of Medicine

CHORAL SOCIETIES ..... HENRY GORDON THUNDER
Conductor Philadelphia Chorus

CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETY OF ... FRANCIS E. CLARK
Founder of the Society of Christian Endeavor

CHRISTIAN SCIENCE ..... ARCHIBALD MCLELLAN
Editor 'Christian Science Journal'

CHRONOLOGY ..... FORREST MORGAN
Connecticut Historical Society

CINCINNATI, OHIO ..... JUDSON HARMON
Ex-Attorney-General United States

CINCINNATI, UNIVERSITY OF ..... HOWARD AYERS, LL.D.
President of the University of Cincinnati

CIRCULATION ..... SMITH ELY JELLIFFE
Editor 'Journal Nervous and Mental Diseases'

CITIZENS' INDUSTRIAL ASSOCIATION OF AMERICA, THE ... DAVID M. PARRY
President Citizens' Industrial Association

CITY MAKING ..... ALBERT KELSEY
Civic Architect

CIVIL LAW ..... CHARLES F. BEACH, JR.
Lecturer on Equity Jurisprudence in the St. Paul College of Law

CIVIL SERVICE REFORM ..... EDWARD CARY
Associate Editor 'New York Times'

CIVIL WAR IN AMERICA ..... GEN. H. V. BOYNTON
Of the United States War Department

KEY TO PRONUNCIATION.

y	(consonantal) yes, young
z	pleasant, rose
zh	azure, pleasure

' (prime), " (secondary) accents, to indicate syllabic stress

THE ENCYCLOPEDIA AMERICANA

Campos, Arsenio Martinez, är-sā'-nē-o mär-tē'nĕth kām'pōs, Spanish military officer: b. Segovia, Spain, 14 Dec. 1834; d. 3 Sept. 1900. He was graduated at the Military Staff School in Madrid and appointed a lieutenant in the army in 1858; served on the staff of Gen. O'Donnell and became chief of the battalion in the Morocco campaign of 1859; was on duty in Cuba with the rank of colonel in 1864–70; took part in suppressing the Carlist insurrection and was promoted brigadier-general in 1870; opposed the republic after the abdication of King Amadeus, and was imprisoned as a conspirator. Under a plea for permission to be allowed to serve as a private, he was released and given command of a division in the 3d Army Corps in 1874. In the next two years he was constantly fighting the Carlists, distinguishing himself at Las Munecas and Galdames and causing the noted siege of Bilboa to be raised. With Gen. Jovellar, he called Alphonso XII. to the throne; was made commander-in-chief of the Catalonia district, and crushed Don Carlos at Pena de la Plata in 1876. For these services he was promoted captain-general. In 1877 he was appointed commander-in-chief in Cuba, and brought the revolution to a close chiefly by means of concessions which, as minister of war and premier in 1879, he endeavored unavailingly to carry out. He was minister of war in 1881 and 1883, commander of the Army of the North of Spain in 1884–5, president of the Spanish senate in 1885; and captain-general of New Castile in 1888. In April 1895 he was appointed governor-general and commander-in-chief in Cuba, and in January 1896 he was recalled to Spain. He found the insurrection more formidable than he had anticipated, and his failure to pursue a vigorous war policy caused much dissatisfaction in Spain. On his arrival in Madrid he repeated his belief that the trouble in Cuba could only be ended by granting reforms.

Cam'pra, An'dra, French composer: b. Aix, Provence, 4 Dec. 1660; d. Versailles, 29 July 1774. He ranks among the most distinguished composers of operas, his themes being classical love stories, notably 'The Triumph of Love'; 'The Amours of Mars and Venus'; 'Hippodamia'; etc.

Campus, the name given in most colleges to the recreation ground more or less enclosed by the college buildings. At Harvard the space here indicated is known as the "yard."

Cam'pus Mar'tius (called also, by way of eminence, *Campus,* merely) was a large place in the suburbs of ancient Rome, consisting of the level ground between the Quirinal, Capitoline, and Pincian hills, and the river Tiber. From the earliest times it seems to have been sacred to the god Mars, from which circumstance it received its name. It was originally set apart for military exercises and contests, as also for the meetings of the comitia by tribes and by centuries. In the later period of the republic, and during the empire, it was a suburban pleasure-ground for the Romans, and was laid out with gardens, shady walks, baths, etc.

Cam'pus Scelera'tus, a name given to a spot within the walls of Rome, and close by the Porta Collina, where those of the vestal virgins who had transgressed their vows were entombed alive, from which circumstance it took its name.

Campvere', now **Veere, Vere,** or **Ter-Vere,** Holland, a maritime town in the province of Zeeland and the island of Walcheren, four miles north-northeast of Middelburg, on the Veerschegat, a sea-arm which separates Walcheren from the island of North Beveland. It is fortified, entered by four gates, has a harbor, a town-house, and a market-place, but its trade has greatly decreased. It is historically interesting as being a place where the Scotch had a separate community and various privileges. Pop. 9,000.

Camtoos', a river of Cape Colony, which falls into the sea west of Algoa Bay; length, 200 miles.

Camuccini, Vincenzo, vĭn-chĕnt-zo kā-moo-chē'nē, Italian historical painter: b. Rome, about 1775; d. 1844. He followed the pseudo-classical style, and his pictures are of large size. Among his best-known works are

'Death of Cæsar'; 'Death of Virginia'; 'The Incredulity of Thomas'; 'Horatius Cocles'; and 'Death of Mary Magdalene.' He also excelled in portraits.

Camus, Antoine de, ăn-twăn dė kă-mü, French physician: b. 1722; d. 1772. He became professor in the University of Paris in 1762; was noted for the original character of his technical publications and his literary ability, and was the author of a comedy, 'Love and Friendship'; a poem. 'The Medical Amphitheatre' (1745); 'Maladies of the Region of the Heart'; and 'The Medicine of the Mind' (1753).

Camus, Armand Gaston, ăr-măń găs-tŏń, French revolutionist: b. Paris, 2 April 1740; d. 2 Nov. 1804. A zealous and ascetic Jansenist, and a master of ecclesiastical law, he was elected advocate-general of the French clergy, and in 1789 member of the States-General by the people of Paris. He now appeared as the resolute foe of the ancient régime, gained possession of and published the so-called 'Red Book,' with its details of expenditures so disadvantageous to the court and its ministers. He was absent in Belgium during the king's trial, but sent his vote for death. He was made member, and afterward president, of the Council of Five Hundred, but resigned in May 1797, and devoted his time to literature.

Cam'wood, Barwood, or **Ringwood,** a red dye-wood (*Baphia nitida*) obtained in Brazil and also in Africa. It once was common in the neighborhood of Sierra Leone, and was also found in Tonquin and other parts of Asia. This wood is of a very fine color, and is principally used in turnery for making knife-handles and other similar articles. The dye, mordanted with alum and tartar, obtained from it is brilliant, but not permanent.

Ca'na of Galilee, a town in Palestine, at no great distance from Capernaum, remarkable chiefly as having been the scene of Christ's first miracle. It was there he turned water into wine (John ii. 1). It was also the city of Nathanael, and the place where Jesus was applied to by the nobleman from Capernaum on behalf of his dying son, and with a word effected the cure. A long-established tradition has identified it with a village bearing the name of Kefr Kenna, which lies about four miles northeast from Nazareth; but this has been disputed.

Canaan, kā'năn, the ancient name of the country west of the Jordan, called also Chanaan, and the Land of Canaan, after one of the sons of Ham. The Greeks applied the term Cana to the entire region between the Jordan and the Mediterranean up to Sidon, afterward termed by them Phœnicia, a name which by degrees came to be confined to the north coast district, or Phœnicia proper. Canaan is generally considered equivalent to the Land of Israel or Palestine. The term is so used in the Pentateuch, and in the early history of the Hebrews it was synonymous with the "Land of Promise." In certain passages in the Prophets the word seems to be restricted in meaning to the maritime plain of Palestine.

Ca'naanites, the general name for the heathen peoples (Jebusites, Hittites, Amorites, etc.) whom the Israelites found dwelling in Canaan (q.v.), west of the Jordan, and whom latterly they utterly subdued, though the subjugation was not quite complete till Solomon's time. They are believed to have been, in part at least, of kindred race with the Israelites; and some authorities find traces of their descendants among the present inhabitants of Palestine. The name Canaanites was also applied in a more restricted sense to one of these peoples.

Canace, kăn'ă sē. (1) In Greek mythology, a daughter of Æolus and Enarete, who was punished by death because of her unlawful passion for her brother; she is mentioned in Gower's 'Confessio Amantis,' and in Chaucer's 'Man of Law's Tale.' (2) In Chaucer's 'Squire's Tale' the daughter of King Cambuscan.

Can'ada, Dominion of, confederation of British provinces in North America, the largest of Great Britain's colonial possessions, comprising the provinces of Ontario, Quebec, Nova Scotia, New Brunswick, British Columbia, Prince Edward Island, and Manitoba, along with a vast region in the northwest known as the Northwest Territories, and certain other vast regions not as yet under a regularly organized system of government. The Dominion thus embraces the whole of British North America, with the exception of Newfoundland and part of Labrador (which belongs to Newfoundland), and its area is not much less than that of Europe. The following table shows the present areas of the provinces of the Dominion, with their populations in 1891 and 1901. The total population in 1871 was 3,686,013.

Provinces	Area in sq. miles	Pop. in 1891	Pop. in 1901
Ontario	222,000	2,112,989	2,167,978
Quebec	347,350	1,488,586	1,620,974
New Brunswick	27,700	321,294	331,093
Nova Scotia	20,550	450,523	459,116
Manitoba	73,956	154,442	246,464
British Columbia	383,000	92,767	190,000
Prince Edward Island	2,133	109,088	103,258
Northwest Territories, etc.	2,371,481	99,722	220,000
Dominion of Canada	3,448,170	4,829,411	5,338,883

Nova Scotia, New Brunswick, and Prince Edward Island are called the maritime provinces, though British Columbia is also a maritime province. In the Northwest Territories are four organized districts, Assiniboia, Saskatchewan, Alberta, and Athabasca. There are also the districts of Keewatin, Yukon, Mackenzie, Franklin, and Ungava. The boundaries are: the Atlantic on the east, the United States on the south, the Pacific and Alaska on the west, and the Arctic Ocean on the north.

Coasts.— On the east the coast-line is very irregular, being marked by deep indentations and fringed with islands. The province of Nova Scotia forms an odd peninsular projection with the Bay of Fundy between it and the mainland, while north of it is the Gulf of St. Lawrence, shut in from the Atlantic by Cape Breton and Newfoundland. In the gulf are the island of Anticosti and Prince Edward Island. The chief features of the north coast are the archipelago of the Arctic islands and the great opening of Hudson Bay, connected with the Atlantic by Hudson Strait, and having as its southern continuation James Bay. On the west coast are Vancouver Island, the Queen Charlotte Islands, and many others. The southern boundary is

most remarkable for passing through the system of Great Lakes — Superior, Huron, Erie, and Ontario, between the last two of which are Niagara Falls, partly belonging to Canada, partly to the United States. To the Atlantic the drainage of these lakes is carried by the St. Lawrence, with which river, and the great gulf into which it expands, are connected the provinces of Ontario, Quebec, New Brunswick, Nova Scotia, and Prince Edward Island, together containing by far the greater portion of the population of the Dominion.

Surface.— With regard to the character of the surface, Canada may be divided roughly into three great regions: a region of woodlands and hills or undulating ground in the east, an immense region of prairies in the middle, and a mountainous forest region in the west. The chief mountain ranges of the east are north and south of the St. Lawrence, and run nearly parallel to that river. On the south are the Shickshock Mountains and the Notre Dame Range, the former rising to the height of 4,000 feet. On the north is the Laurentian Range (perhaps attaining 4,000 feet), running in a westerly direction from the Labrador coast to the Ottawa River, and forming the watershed between the rivers which flow into the St. Lawrence and those which flow into Hudson Bay. The prairie region and great wheat-producing tract extends northwest of Lake Superior to the Rocky Mountains. This is a great region of plains, with low hills in some places; it is well wooded in many parts, elsewhere bare or with an agreeable mixture of woodland and prairie. Some portions are decidedly infertile, but their area is small compared with the whole. On the Pacific slope we have a distinctly mountainous region, including the Rockies, some peaks of which (Mt. Hooker, Mt. Brown) attain a height of about 16,000 feet, as also the Gold and the Cascade ranges. This region, with its high mountains, deep gorges or cañons, large and rapid rivers, long and narrow lakes, great forests of gigantic trees, and its narrow inlets, presents an aspect peculiar to itself.

Lakes and Rivers.— The vast lake and river systems which Canada possesses of its own, or shares with the United States, give it a unique character. Everywhere in the interior are rivers and lakes. To Hudson Bay flow the Albany, Nelson, Churchill, and many other streams; to the Arctic Ocean, the Mackenzie, Coppermine, and Back or Great Fish River; to the Pacific, the Fraser, Skeena, Stickeen, etc. The basin of the St. Lawrence, with the connected lakes, Superior, Huron, Michigan, Erie, and Ontario, affords a continuous waterway from the Atlantic to the interior of the continent. To this system belong the Ottawa, Gatineau, Richelieu, St. Maurice, Saguenay, and other rivers. In the prairie region and the northwest are similar great lake and river systems, formed by the Saskatchewan, Nelson, Churchill, Athabasca, and Mackenzie rivers, and the great lakes, Winnipeg, Athabasca, Great Slave, and Great Bear. The Saskatchewan, lying in the heart of the rich wheat-growing district, must in time prove a far more important waterway than at present. The Mackenzie and its connected lakes and rivers form the most remarkable feature of the far northwest. This river, including its tributary, the Peace, has a length of perhaps 2,500 miles, and drains an area of 550,000 square miles, or almost double that of the St. Lawrence basin. Between the Mackenzie system and Hudson Bay is a great region called from its desolate character the Barren Grounds.

Geology and Minerals.— As regards the geological features of Canada, a great part of the Dominion north of the St. Lawrence and west of Hudson Bay is covered with archæan rocks belonging to the Laurentian system, and consisting largely of granite and gneiss, with quartz-rock, schist, limestone, etc. South of the St. Lawrence, in New Brunswick and Nova Scotia, is a considerable development of carboniferous strata. Between the archæan rocks and the Rocky Mountains is a great area of secondary (Mesozoic) strata. In the Rocky Mountain region the archæan, palæozoic, mesozoic, and tertiary systems are represented. Canada has great mineral wealth. Iron of the best quality has been found in great abundance in Quebec, Ontario, and British Columbia. The district round Lake Superior and the upper part of Lake Huron abounds in copper, and has much silver as well; and Nova Scotia, Assiniboia, Alberta, and British Columbia are rich in coal. In Nova Scotia there are a number of coal-mines worked; gold is also obtained in some quantity, as well as iron. Coal is worked in the northwest, and more extensively in British Columbia, which is also rich in iron; but the most valuable mineral of the latter is gold. Much gold has latterly been obtained on the Klondike, near Alaska. Large quantities of petroleum are obtained. The chief oil district is the peninsula in the province of Ontario formed by Lake Erie and Lake Huron and the river St. Clair. Other useful mineral products are salt, gypsum, phosphate of lime, slates, asbestos, plumbago, antimony, and building-stone.

Animals.— The chief wild animals (some of them represented by several species) are the deer, buffalo, musk-ox, bear, wolf, fox, otter, beaver, squirrel, raccoon, muskrat, and marten. The buffalo is now scarce and will probably soon be exterminated. The largest of the deer kind is the moose, or elk, which is found in New Brunswick, Nova Scotia, and in northern parts of Quebec, as well as in the far west and northwest. The reindeer is found in the north. The grizzly bear is met with in the Rocky Mountains, and the polar bear in the extreme north and northeast. Fur-bearing animals are so numerous as to have been a source of revenue to a large trading company like the Hudson Bay Company for over two centuries. There are birds in great variety, Canada having more than 700 of these in all. They include the wild swan, wild turkey, geese and ducks of various kinds, partridges, quail, prairie-fowl, pigeon, woodcock, snipe, plover, etc.; besides eagles, hawks, owls, and many smaller birds, among which are two species of humming-bird. Except at certain seasons, game of all kinds may be shot at will. The rattlesnake and other snakes occur, but are less common than in the United States. The seas, lakes, and rivers, especially the Gulf of St. Lawrence and the neighboring waters, abound in almost all kinds of fish, and the fisheries are extremely valuable, employing over 250,000 people. The chief sea-fish caught include cod, herring, mackerel, halibut, haddock, hake, shad, and salmon. The rivers and lakes abound with salmon, whitefish, bass, trout, sturgeon, pike, pickerel, and other fishes. The seal and whale fisheries

are also valuable. Lobsters and oysters are abundant and excellent.

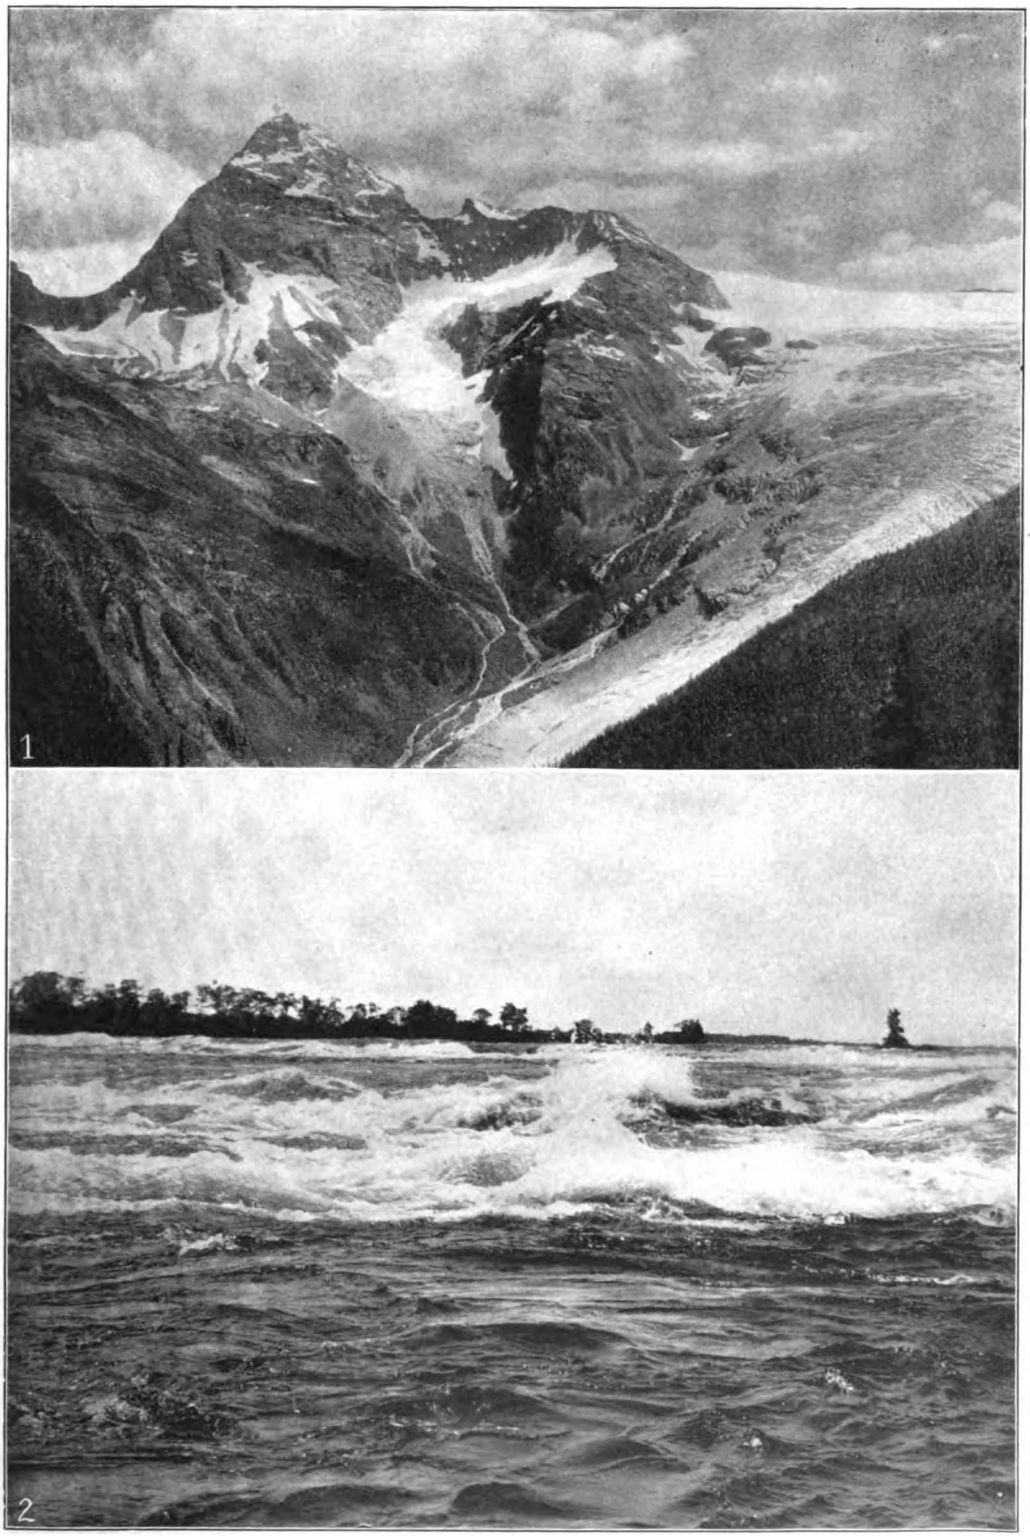
Vegetation.— The forests are of great extent, and the timber trade is a great source of wealth, the value of the timber and forest products shipped to Great Britain being annually over $20,000,000. In the forests grow more than 60 kinds of trees. Among the most valuable are the white and red pine, white and black spruce, maple, ash, beech, oak, walnut, butternut, chestnut, basswood, birch, and cedar. Over most of the Dominion (except in the prairie regions of the interior) good timber is found, though in the older and more closely settled parts the forests have been largely cleared off. The forests of British Columbia produce the largest timber, the Douglas pine being the chief tree. The balsam poplar grows to an immense size on the Athabasca, Peace, and Mackenzie rivers, and even at the mouth of the last, within the Arctic Circle, trees of some size are found. The Banksian pine grows to the height of 100 feet on the southern shores of Hudson Bay; and spruce suitable for building purposes, and the tamarac or larch, extend as far north as Fort George on its east and Fort Churchill on its west shore. The sugar-maple, a forest tree attaining the height of 120 feet, flourishes in the greater part of the St. Lawrence valley up to lat. 49°, and is much valued for the sugar that is obtained from it. There are a great many varieties of wild fruits, as the wild plum, wild cherry, raspberry, serviceberry, cranberry, gooseberry, strawberry, black and red currant, wild vine, blueberry, buffaloberry, etc., and numerous wild flowers and flowering shrubs. Of the wild fruits, the raspberry, the cranberry, and the blueberry are important economically. There are rich pasture grasses, but they cannot be utilized in cultivation.

Climate.— The climate of a country of such vast extent and varied features as Canada naturally differs very much in different places, and in this respect British Columbia on the Pacific coast, and Nova Scotia and the other Atlantic regions, are very dissimilar to the prairie region of the centre. So different, indeed, is the climate of one portion of the Dominion from that of other portions that Canada has been said to present "climates and productions similar to those of northwest and central Europe — that is, of Russia, Norway, the British Islands, Denmark, Germany, France, Holland, Belgium, Switzerland, and Northern Italy." In Ontario and the region of the Upper St. Lawrence it may be described as temperate, although the heat in summer and the cold in winter are on the average 20 degrees greater than in the corresponding seasons in Great Britain. Generally the climate of the Dominion shows considerable extremes of heat and cold, but except in some of the coast regions the exceeding dryness of the Canadian atmosphere makes both extremes of temperature more pleasant and healthful than similar temperatures in Great Britain. Apart from the portions of the Dominion that fall within the Arctic Circle, Labrador, and all the country east of Hudson Bay have the most severe climate. The Pacific coast region has a decidedly moist climate. The peninsula lying between Lake Ontario, Lake Erie, and Lake Huron has the finest climate, in which fruits, shrubs, and flowers may be grown that cannot stand the winter elsewhere. The Mackenzie River district — especially in the region of the Peace River, where the temperature throughout the year is remarkably genial — possesses a climate much less severe than one might expect, and suitable for agriculture almost to the Arctic Ocean.

Agriculture.— Both by soil and climate Canada is specially adapted for agriculture. Within the last few years its agricultural importance has greatly increased, and when the great prairies are brought under cultivation Canada will be one of the chief agricultural countries in the world. In general, sowing is later than in the northern parts of Great Britain, but the harvest is gathered earlier, a large part of it usually before the end of July, so rapid is the growth during the hot Canadian summer. The chief crops are wheat, barley, oats, rye, peas, maize, buckwheat, potatoes, turnips, mangel-wurzel, etc. The breeds of cattle are now being much improved partly by the introduction of high-class cattle from Great Britain; and cattle, horses, and sheep are exported. The value of exports connected with agriculture, including grain, flour, animals, and animal products (as cheese, eggs, etc.), is more than $75,000,000 annually. The province of Ontario has an agricultural college and model farm at Guelph, and there are also model farms in Quebec. Fruit-growing is an important industry in certain localities, and large quantities of apples are exported, as well as canned and dried fruits. Peaches are grown to most advantage in the Niagara district of Ontario, where peach orchards many acres in extent are to be seen. The vine is also cultivated, and good wine is made. Pears, plums, and many kinds of berry fruits are produced in great perfection.

Commerce.— The trade of the Dominion is chiefly with the United States and Great Britain. About four fifths of the exports are sent to these two countries, while nearly nine tenths of the imports come from them. Besides timber, animals and their produce, and agricultural products, the chief articles of export are fish, coal, and other minerals, leather, and wooden goods. The total exports in 1900 were valued at $170,600,000; the imports at $180,800,000. The imports chiefly consist of manufactured goods, coal, iron, tea, coffee, sugar, cotton, etc. A uniform decimal system of coinage was established throughout the Dominion in 1871. The unit of account is the dollar of 100 cents, the value of which is declared to be on the basis of 486 cents and two thirds of a cent to the pound of British sterling money. The money used consists of bank-bills, and gold, silver, and bronze coins, besides government notes of small denominations up to four dollars, the bank-bills being not of lower denominations than five dollars. There is a uniform system of weights and measures, the Canadian standards being the same as the British imperial standards. The British hundredweight of 112 pounds and ton of 2,240 pounds are, however, superseded by the United States weights of 100 pounds and 2,000 pounds respectively.

Railroads.— The inland trade of Canada has been much improved by the completion of the various lines of railroad, and is also greatly furthered by the extensive system of canals. Of the railroads the greatest is the Canadian Pacific, running from Montreal across the whole continent to Vancouver on the Pacific coast in British Columbia; length, about 2,900 miles, exclusive



1. Mount Sir Donald, and the Illecillewat Glacier, Selkirk Mountains.
2. Lachine Rapids, St. Lawrence River.

Mau

of branches. (See CANADIAN PACIFIC RAILWAY.) The Grand Trunk, which crosses the St. Lawrence at Montreal by the stupendous Victoria Bridge, connects the maritime provinces and the northeastern United States with the Western railroads. Other important railroads are the Intercolonial from Halifax, Nova Scotia, to Quebec, Montreal, etc.; and the Canada Atlantic line, giving a very direct route between the seaboard and the Great Lakes. The Dominion has now about 18,000 miles of railroad.

Canals.— Some of the canals are vast achievements. The most important, from a commercial point of view, are the St. Lawrence canals and the Welland Canal. The former series of canals, with an aggregate length of about 70 miles, avoids the rapids on the St. Lawrence between Montreal and Kingston on Lake Ontario, and thus affords to vessels the means of ascending to that lake (in descending vessels of 700 tons can shoot the rapids with safety); and the latter, which has a length of 27 miles, avoids the Niagara Falls and rapids, and enables vessels to ascend from Lake Ontario to Lake Erie. Both the Welland Canal and the St. Lawrence series have been enlarged and deepened, so as to accommodate the increased traffic expected as a result of the settlement of the northwestern provinces, and the construction of the Canadian Pacific line. The last Canadian canal necessary to complete the navigation of the St. Lawrence to Lake Superior is St. Mary's Canal, opened in 1895 at a cost of $3,750,000, avoiding the rapids in St. Mary's River, by which Lake Superior pours its waters into Lake Huron. Next after those mentioned, the most important of the Canadian canals is the series of locks and short artificial connections known as the Rideau Canal. It connects Lake Ontario at Kingston with the Ottawa near the city of that name. By means of these works large vessels can now sail by the St. Lawrence route from the Atlantic to the head of Lake Superior.

Constitution and Government.— By the Act of Confederation of 1867 the Constitution of the Dominion was required to be similar in principle to that of the United Kingdom. There is a central federal government with separate provincial governments and legislatures. The central executive government is vested in the sovereign of Great Britain and Ireland, and is carried on in his name by a governor-general appointed by the Crown, and a privy council. The governor-general has a salary amounting to $50,000 per annum. He is assisted by a privy council consisting of the prime minister and 12 other ministers or heads of departments. The legislative authority rests with a Parliament consisting of two houses, the Senate and the House of Commons. The Senate now consists of 80 members, who are nominated by the governor-general. Each senator must be a born or naturalized subject, 30 years of age, and possessed of real or personal property to the value of at least $4,000 in the province for which he is appointed. There are 24 senators from the province of Ontario, 24 from Quebec, 10 from Nova Scotia, 10 from New Brunswick, 4 from Manitoba, 4 from Prince Edward Island, 3 from British Columbia, and 2 from the territories. The House of Commons is elected by the people for five years. There is a uniform franchise, a vote being given to every male of 21, possessed of a small property qualification. Each of the provinces has a separate Parliament and administration, independent in its own sphere, at the head being a lieutenant-governor appointed by the central government. Ontario, Manitoba, and British Columbia have only one chamber; the other provinces have two. There is a very perfect system of municipal government throughout the Dominion, the counties and townships having local governments or councils which regulate their local taxation. The administration of justice is based on the English model, except in the province of Quebec, where the old French law prevails. The only court that has jurisdiction throughout the Dominion (except the exchequer and the maritime court) is the supreme court, the ultimate court of appeal in civil and criminal cases. In certain cases an appeal may be had to his Majesty's privy council. The capital of the Dominion is Ottawa, but the largest cities are Montreal, Toronto, and Quebec. The Dominion revenue and expenditure are over $40,000,000 annually; the debt is about $265,000,000. Canada has both a large volunteer force and a militia. The former comprises many well-equipped organizations in infantry, cavalry, and artillery. A military college for the training of officers is maintained by the Dominion government at Kingston.

Religion and Education.— There is no state church in the Dominion. The prevailing religion in Quebec is that of the Roman Catholic Church. In Ontario Methodists predominate, then Presbyterians, the English Church, and the Roman Catholics. Education is well attended to, being everywhere more or less under the supervision of government, and excellent free schools being provided. In Ontario, Quebec, and the northwest separate schools are provided for Roman Catholics; in the other provinces the schools are unsectarian. All the provinces except British Columbia have universities or colleges, and the provision made for higher education in general is exceptionally good, a fact which is said to have an observable influence on the tone of the periodical press.

People.— The population is increasing rapidly both naturally and by means of immigration. The nationality of the inhabitants is varied. Ontario is settled principally by emigrants from Great Britain and their descendants, with considerable numbers of Germans and Americans. In the province of Quebec the people are mostly French in origin, speech, and customs, being mainly descendants of the French colonists who inhabited the region before it became British. There are, besides, the Indian tribes and the Esquimaux, the latter in the extreme north. The Indians are estimated to number about 125,000. They are divided into various tribes as well as larger stocks or races, such as the Tinneh or Athabascan Indians, the Thlinkets and Hydahs of British Columbia and the west coast, the Algonquins, Hurons, Iroquois, etc., of the St. Lawrence region. In the old provinces separate land allotments have been granted to the Indian population, and there the Indians have adopted a settled mode of life, and have made considerable advances in civilization. A separate department of the Canadian government exercises a general supervision over their affairs. Schools have been established among them, and they are said to learn to read and write quickly and to show some talent for music and drawing.

The majority of the Indians, however, live beyond the influences of this kind of civilization, and wander over the plains of the northwest, supporting themselves by fishing and hunting, carrying their furs to forts or trading stations. There are also many half-breeds of mingled white (especially French) and Indian blood. These are intelligent and industrious, and engage in agriculture and other occupations, and usually speak a sort of corrupt French patois.

History.— English ships were the first to reach the shores of what is now Canada. In 1497 John Cabot, sailing from Bristol, landed on the coast of Labrador, and planted the English flag there. But it was the French navigator Jacques Cartier who, in 1534, first really opened up Canada for European settlers. Some years later he landed with 200 colonists, but after struggling for two winters they were compelled to return. For the next 50 years no further attempts were made in these regions, except that on the part of the English, Martin Frobisher in 1576, and Sir Humphrey Gilbert in 1583, explored and took formal possession of Newfoundland and the adjacent coasts; while in 1603 Samuel Champlain, a French naval officer, made a settlement at Port Royal in Acadia (New Brunswick and Nova Scotia), which was soon afterward abandoned. At length, in 1608, a French colony under the leadership of Champlain and Des Monts settled at Quebec. Two years later another English navigator, Henry Hudson, explored the river and the bay which bear his name. In 1627, Cardinal Richelieu organized the company of the Hundred Associates for the further colonization of New France. The most formidable foes of the colonists, whose number in 1663 was still under 2,000, were the Iroquois Indians, who swarmed round the settlements. In 1663, Colbert being at the head of affairs in France, fresh supplies of emigrants and a strong body of troops were sent out to Canada. The Iroquois found it advisable to make peace, and the soldiers, turning colonists, received grants of land. In 1682, however, a new war with the Iroquois broke out, in which the colonists, at first successful, latterly suffered severely in the massacre of Lachine.

The French colonists had scarcely recovered from this blow when war broke out between France and England. The French struck the first blow by the burning of the British settlement at Corlaer (now Schenectady), and the massacre of its inhabitants. The British colonists retaliated; but the Peace of Ryswick put an end to the war. In 1702 a new conflict arose, terminating in 1713 with the Peace of Utrecht, by which the British obtained Acadia, Newfoundland, and the regions around Hudson Bay, France retaining Canada, Cape Breton, etc. In the 30 years of peace which followed the French did not altogether neglect industrial development, but in general their colonists lacked the qualifications for agricultural and other settled pursuits. The British colonists, on the other hand, held to agriculture, and reclaimed every year great tracts of forest land. As a natural consequence their population rapidly increased, and when the final struggle began, the British colonies in America numbered 3,000,000 inhabitants against some 60,000 French colonists. In 1754 the French governor, Duquesne, an energetic and aggressive man, established new military posts in the Ohio valley, and seized a newly built British stockade on the spot where Pittsburg now stands. As the result of this action both sides prepared for war. The English government sent out two regiments under Gen. Braddock, who allowed himself to be surprised and routed near Monongahela; but an expedition against Crown Point under the leadership of Gen. William Johnson drove the French within their intrenched camp at Ticonderoga. Now happened the incident of the expulsion of the Acadian peasants (immortalized in Longfellow's 'Evangeline'), of whom about 7,000 still remained in Nova Scotia, mostly on the shores of the Bay of Fundy. They refused to swear allegiance to the British government, and some of them took part in the Indian raids against the British settlements. On these grounds the council at Halifax resolved upon the expulsion of the whole French population, and the measure was thoroughly carried into effect. The war in America was but a portion of the great conflict in which Great Britain was now engaged against France — the Seven Years' war, 1756–63. The early part of the struggle was decidedly in favor of the French, but with the appointment of Pitt as colleague of Newcastle and virtual prime minister in 1758, the face of affairs changed. Reinforcements under Wolfe, Howe, and Amherst were despatched, and after a determined resistance the struggle terminated in the final defeat of the French (1760) and the capitulation of Montreal.

Canada was now formally annexed to the British empire, and in 1774 an act passed in the British Parliament (the Quebec Act) extended the bounds of the province from Labrador to the Mississippi and from the Ohio to the watershed of Hudson Bay. In 1775 the American Revolution broke out, and Canada became the scene of a brief struggle between the royalists and the revolted colonists of New England. The war ended with the recognition of the independence of the American colonies by the Treaty of Versailles, 3 Sept. 1783, which detached from Canada the region between the Mississippi and the Ohio. On the other hand, thousands of American loyalists sought new homes in Canada. In 1791 Canada was divided into two provinces — Upper Canada or Ontario, and Lower Canada or Quebec — the latter still retaining its seigneurial tenure and French law in civil cases. In Upper Canada British law and freehold tenure were introduced. In both Upper and Lower Canada representative institutions, although not responsible government, were established. From 1812 to 1815, war having broken out between Great Britain and America, Canada was against the theatre of a bloody strife, among the chief incidents of which were Brock's victory over the Americans on the heights of Queenstown, and the battles of Chippewa, Lundy's Lane, Moravian's Town, etc. In 1837–8 the discontent of the people of Canada with their system of irresponsible government took the form of a rebellion, which was repressed after a brief struggle. The Earl of Durham was sent out as governor-general to settle affairs on a just and liberal basis, and made a report on the condition of Canada, which is one of the historical monuments of the country. The result of the rebellion and this report was the reunion in 1841 of Upper and Lower Canada as one province with equal rep-

resentation in the common legislature, and the practical concession on the part of the mother country of responsible government. Kingston was selected as the new seat of government, and three years afterward Montreal. In 1854 the Reciprocity Treaty with America was concluded, according to which there was to be free exchange of the products of sea and land, with navigation of the St. Lawrence, etc. In 1858 Ottawa was finally selected as the capital of Canada, the choice having been referred to the queen. Under the old Constitution the provinces of Upper and Lower Canada had equal representation in the legislature, but a demand arose on the part of the Upper Canadians for representation by population. This demand was practically conceded in a scheme of federation of the British North American colonies approved of by the Canadian Parliament at Quebec in 1865, and forwarded to the imperial government for approbation. In 1866 the Reciprocity Treaty with the United States having expired, it was not renewed until 1871, when an arrangement for 12 years was signed. In 1866 a Fenian movement against Canada originated in the United States, but the prompt mustering of Canadian volunteers made the filibusters recross the frontier in some haste, to be ultimately disarmed and dispersed by United States troops.

In 1867 (28 March) the British North America act for confederation of the colonies passed the Imperial Parliament. It united Upper Canada or Ontario, Lower Canada or Quebec, New Brunswick, and Nova Scotia into one territory, to be named the Dominion of Canada. Newfoundland declared against joining the confederation, but with that exception all the British territory north of the United States was gradually included within the Dominion — the Hudson Bay Company territory by purchase in 1868, British Columbia in 1871, Prince Edward Island in 1873. In 1870 an insurrection of the Red River settlers, who were under apprehensions as to how their titles to their lands might be affected by the cession of the Hudson Bay Company's rights, took place under the leadership of Louis Riel, and had to be suppressed by a military expedition under Col. (now Viscount) Wolseley. In 1884 the half-breeds and Indians of the Saskatchewan and Assiniboine districts rebelled against the government, but the movement was suppressed in a few months by Gen. Middleton and his volunteer forces, the leader, Louis Riel, being executed at Regina in 1885. On 7 November of the same year the Canadian Pacific R.R. was completed. Since 1883, when the Washington Treaty expired, disputes between the American and Canadian fishermen have been frequent. A joint British and American commission, instituted in 1887, failed to arrive at a final settlement. The seal-fishing in Bering Sea and the Alaskan boundaries question have also caused friction with the United States. In 1898 an Anglo-American commission was appointed to adjust all controversial matters between the two countries, but has not been successful in bringing about a final settlement.

Canada and the Empire. The British empire is no longer a geographical expression. It lives and moves and has being. Men doubted, and now they doubt no longer. For the first time in all history a parent state has seen her sons, who, successful builders of new states, throw themselves of their own free will into her quarrel, making it their own. They have watched how in one of the colonies foreign influence has been working against the welfare of a community like their own. They have deliberately judged from their own experience that it is not good for that colony or for themselves as constituent parts of the empire that the great experiment of nation-building should be marred or destroyed in south Africa. They have known among themselves how unsound is the theory or sentiment that racial differences should be crystallized into effective national governments.

Free institutions are the solvents of racial eccentricities, of seclusion, of partial privileges, and unwholesome ambitions. They have proved, by union among themselves, that new nations can grow only where tolerance and a power of adoption and the reception of new ideas coexist. They have in some instances come through trials of great severity before they found this truth. The blessings they have derived from their knowledge they have determined shall be gained in south Africa. Even if their ministers had for a while held back, doubtful as many cautious statesmen are of entering upon a great experiment before knowing the mind of their constituents, they could not hesitate except for a moment. The will of their peoples was instantly declared with a determination which no popular government could have resisted, even if they had been, as they were not, desirous to do so. From New Zealand, from Australia, from Canada, came the message, uttered as with one voice: "In the danger menacing Great Britain's empire through the peril affecting a great colony, we are with the motherland, and with the loyalists in that colony. We will aid in removing the evil. We will confirm the action of the parent state, we are at her side and our blood shall seal with hers the young liberties of the country we hope to see, with ourselves, a free dominion under our queen."

Never was there conflict more grand in its immediate result. Whatever the future may give, however blighted may be the hopes of this hour, the grandeur of the desire to spread constitutional liberty as forthshown by the colonies can never be darkened. The fairest hopes of nations as of men may miscarry, but it will ever be an encouragement to trust in the world's progress; that loyalty to freedom and advancement has been the empire's watchword in the closing year of the past century.

"Loyalty to freedom"— yes. That is the loyalty to Canada. She is the oldest of those peoples who have wrought for order and liberty among themselves, and have won by their own work what they have sought. It is because the British government has left them free to build up their new nation, that they have fought for another kindred nation's birth. This loyalty is allegiance to no government that does not stand as the champion of what they know to be liberty. They have not looked in vain to their old "home" for such championship. They have carried to their new lands the forms of procedure and legislation of law which they had at "home." They are no fugitives from any rule; they are the apostles of the authority they knew and loved. This can be said of no other emigrants

of any land or time. Others have fled from laws they found distasteful or oppressive, and have therefore not carried with them as household gods the institutions they were glad or content to leave behind them.

It has been otherwise with us. New York and New Scotland, and New South Wales, did not want to have a renovated set of institutions, but desired the old to flourish in the new soils christened by the ancient names. Constitutional liberty was to flourish on lands where a wide area could be attained for desires common to those who stayed and those who went. The faults of the 18th century were as dead as Julius Cæsar. The colonies had become strong enough to prove that they required no leading strings. They were strong enough to know they could give good value for the naval and military aid this grand old country had been ever ready to accord to them. They saw that she would be hard put to it, should the jealousy of foreign powers tempt them to assist an attempt to bring under a strange flag a great part of a sister colony's territory.

They disliked the conceit and racial inclusiveness which made the secessionists of Dutch descent attempt to set up and maintain a separate nationality, holding British law and institutions as not good enough for them. They saw that a separate small nationality half way between the Zambesi and the Cape, blocking progress, was a thing that might enlist the sympathy of gallant individuals, but could not warp the judgment of statesmen in its favor. Such a state would always be trying to make itself as important as its profession of independence prompted it to be, and would inevitably mar the welfare of the larger area which should be under one government, working for the welfare of the whole.

The new wine was bursting the old Dutch bottle. If the old bottle had the Old Testament in its favor, as its president declared, the New Testament had better texts for the hospitality and generous spirit of the new wine. The great colonists liked the demands for equal rights put forward by the "Outlanders." They disliked their avoidance by the Boers. They disliked yet more the Boer declaration of war against the British to foster obsolete privilege. They said "This is a war that concerns all who practise freedom in government. We fight with England."

And then came the spectacle which stands alone as a world wonder. Volunteers begged to be enrolled, not in scores, but by thousands. Men occupying peaceful and profitable places in civil life, but enrolled in the Canadian and other militia, offered their services to sail 7,000 or 10,000 miles to fight on the veldt for the queen's authority in Africa. Only a small representation from each enrolled regiment was taken, though in very many cases throughout the Canadian provinces whole companies, and more in each battalion desired to go. A fine body of infantry selected from every province, three excellent batteries of artillery, and a force of cavalry unique not only for the efficiency of its men, but also because its equipment was the gift of a patriotic Canadian, Lord Strathcona, was the contingent sent by the British North American Dominion. Had more men been wanted, more would have gone. And when they arrived at the Cape, eager to take part in warfare at the front, they were necessarily for a time obliged to guard communications, and undergo the drudgery inseparable from all good work, but doubly hard to bear when comrades are reaping the harvest of battle and glory at "the front."

But the opportunity came before long to show of what metal they were made, and at Paardeberg the desperate charge which immediately led to the surrender of Cronje's force, was led by the gallant son of the speaker of the Canadian House of Commons, Capt. Pelletier. A worthy descendant of an ancient French stock, the bravest among the brave, he and his comrades were ready to lay down their lives for the form of government which they knew at home as the outcome of the freedom known of old to Norman and British ancestors, and enjoyed by their race in the England they colonized, as well as in England's Canadian colony. Col. Otter, a most experienced and gallant officer, commanded the Dominion infantry. Col. Drury, an old friend of mine, of a New Brunswick English descent, was chief of the artillery, one of the batteries of which arm took part in Mahon's wonderful march to the relief of Mafeking.

At the Colonial exhibition I remember an old lady saying: "How proud the queen must be to think that all these countries belong to her." The old lady was right in thinking that the queen personally holds the hearts and the allegiance of all. But she was mistaken if she thought that her British governors could claim ownership. No, the great colonies have received and do receive Britain's full support. They in turn are ready to give their aid. But it is on no basis of legal allegiance, because such cannot exist between grown-up son and parent. It is in free alliance, based on common advantage, the more to be fostered and cherished on account of love and historic sentiment, and common use of institutions, that the connection exists.

The colonies belong to Great Britain only as Great Britain belongs to the colonies. It is the interest of the parent state to have these strong young men to guard her doors and give no harbor to her enemies. It is the young states' interest to keep their shores inviolable by the aid of the British navy, and their treasuries supplied by the confidence of British capitalists.

Canada has more people than had England in the days of Elizabeth. She has more than had the United States when they declared independence. More tonnage passes the Canadian Main Canal at the east end of Lake Superior than passes the Suez Canal. Australia is following fast in Canada's wake in population and prosperity. These are not states from whom allegiance can be exacted, or loyalty demanded, save as loyalty comes from pride in common ancestry, in heart-hatred of baser forms of government, in love of the glorious traditions of our history, in resolve to keep united whose union means freedom and progress, and a common effort toward one splendid ambition, namely, one liberty, one grand civilization, one flag, one empire that shall keep for all of its members the laws they themselves are ready to maintain, by preference in peace, and in necessity by war.

ARGYLE.

Canada, Modern Development of. When the 19th century opened the population of the five provinces of Prince Edward Island, Nova Scotia, New Brunswick, Lower Canada, and Upper Canada did not reach 270,000, and of the whole number at least 150,000 were French Canadians. Their total trade did not exceed $10,000,000, the public revenues were inadequate for the public requirements, and the British government was obliged to give considerable aid to the provincial treasuries. The government was directly controlled by the imperial secretary of state in London and his representatives in the several provinces. The governing authorities in the five provinces were these: A governor-general in Lower Canada — then the most populous section of British North America — who exercised a nominal supervision, as the royal representative, over all British North America; a lieutenant-governor in each of the other four provinces; an executive council in Upper and Lower Canada, generally composed of members of the legislative council; a legislative council in all the provinces appointed by the Crown, and in Nova Scotia, New Brunswick, and Prince Edward Island, exercising executive as well as legislative functions; an assembly, elected by voters possessing a small property qualification, in all the five provinces.

The imperial government certainly had the interests of British America at heart, but nevertheless it erected a structure of provincial government which was defective at its very foundation. The Crown was supreme in the executive and legislative councils, and the assembly had little influence over the administration of public affairs. The absence of a system of local or municipal institutions in the provinces was another serious weakness in the provincial machinery. The people were called upon to manage the affairs of a province before they had learned to administer their purely local affairs in city, township, or village. Despite these defects inherent in the system of government, the machinery worked with little friction for a while. The unfortunate war of 1812–5, in which Canada performed her duty to the empire with infinite patriotism, prevented political dissension, since all classes of people recognized the supreme necessity of uniting at this crisis to defend their homes and country. The war did much to solidify the various racial elements of British North America during its formative stage. Frenchmen, Englishmen, Scotchmen from the Lowlands and Highlands, Irishmen, and Americans, one and all, united to support British connection. But when peace was proclaimed and the legislatures were relieved from the pressure that the war had brought upon them, the politicians again got the upper hand. The machinery of government became clogged, and political strife convulsed the country from one end to the other. An «irrepressible conflict» arose between the government and the governed classes.

In all the provinces, but especially in Lower Canada, the people saw their representatives practically ignored by the governing body, their money expended without the authority of the legislature, and the country ruled by irresponsible officials. A system which gave little or no weight to public opinion as represented in the assembly was necessarily imperfect and unstable; and the natural result was a frequent deadlock between the legislative council, controlled by the official class, and the House, elected by the people. The governors necessarily took the side of the men whom they had themselves appointed and with whom they were acting. This system of government was generally worked in direct contravention to the principle of responsibility to the majority in the popular House. Political agitators had abundant opportunities for exciting popular passion. In Lower Canada, Papineau — an eloquent but impulsive man, having rather the qualities of an agitator than those of a statesman — led the majority of his compatriots. For years he contended for a legislative council elected by the people; for it is curious to note that none of the men who were at the head of the popular party in Lower Canada ever recognized the fact, as did their contemporaries in Upper Canada that difficulties would be best solved, not by electing an upper House, but by obtaining an executive which would only hold office while supported by a majority of the representatives in the assembly. In Upper Canada the radical section of the Liberal party was led by W. Lyon Mackenzie, who fought vigorously against what was generally known as the «Family Compact,» which occupied all the public offices and controlled the government.

Such was the political situation in Canada when Queen Victoria ascended the throne on 20 June 1837. If we survey the general condition of things in those troublous times, the prospect was not encouraging. The total population of the provinces did not exceed 1,350,000, nearly one half being French Canadians. Trade and commerce were quite paralyzed by the political discontent which had existed for years, and had already broken out into rebellion. The value of the whole trade of British North America — that is, of the imports and exports — was about $25,000,000. The revenue of all the provinces did not exceed $7,000,000, and in more than one province — notably in Upper Canada — it was insufficient to meet the ordinary expenditures. The total production of wheat did not exceed 5,000,000 bushels, of which the greater portion was raised in French Canada, despite the want of energy and knowledge displayed by the habitants in the cultivation of the soil. The seigniorial exactions — a heritage from the French régime — retarded settlement and enterprise in the province of Lower Canada. The excessive grants of land made by the Crown to the loyalists, military men, and the Anglican Church, kept valuable districts of Upper Canada idle and profitless for years. The little island of Prince Edward had been nearly all granted by ballot to a few landlords in a single day, and till the entrance of the colony into the Confederation in 1873, its progress was seriously crippled by the difficulties arising out of this wholesale disposal of the public domain. The means of communication in each province were most wretched, in the absence of a municipal system and local taxation, and as a result of the ownership of large districts by absentee proprietors. The only town of importance was Montreal, with a population of 40,000. Few streets in the cities were lighted or paved; buildings of architectural beauty were the exception. Denominational colleges existed for the higher education of youth, but the state had not in any degree intervened successfully in the establishment of a system of popular elementary

schools. In 1838 there was in all the public and private schools of British North America only one fifteenth out of a total population of 1,500,000. The administration of justice was satisfactory in all the provinces except Lower Canada, where justice was sadly clogged by national jealousies, which showed themselves constantly in the jury-box. As in the courts of law and in the legislature of French Canada, so it was in social and every-day life — the French Canadian in direct antagonism to the English Canadian. "I expected," wrote Lord Durham in 1839, "to find a contest between a government and a people; I found two nations warring in the bosom of a single state; I found a struggle not of principles, but of races." The special mission of Lord Durham, who was sent to Canada as governor-general in 1838, was a turning-point in the political development of the British North American colonies. As a sequence of his report, so replete with political wisdom, English statesmen of all parties, notably Lord John Russell, recognized at last the necessity of intrusting a larger measure of self-government to the people of the provinces — of giving them as complete control of their internal affairs as was compatible with the security of the empire. The union of the Canadas in 1841, when the French and English sections were equally represented in one legislature, was the first important step in the political development of all the provinces of British North America. Then followed between 1841 and 1849 the concession of responsible government in the fullest sense of the term, while the legislatures obtained control of the provincial revenues and taxes. At the same time came the repeal of the navigation laws which had fettered colonial trade since the days of Cromwell. The post-office was given to the Canadian government, and in fact all matters that could be considered to appertain to the provinces were now placed under their immediate legislative jurisdiction.

The Canadians, under the impulse of relatively unfettered action, went vigorously to work to lay the foundations of a municipal system, as indispensable to the operations of local self-government. The troublesome land question involved in the seigniorial tenure was settled after much agitation on terms favorable to vested interests, while the clergy reserves were also arranged so as no longer to favor one church at the expense of others, or to impede the progress of settlement and cultivation. The union of the Canadas lasted until 1867, when it had outgrown its usefulness, and the provinces found it necessary to enter into a federation, which had been foreshadowed by Lord Durham and advocated by many eminent men even before his time. The confederation of 1867 brought only four provinces into one territorial organization for general or Dominion purposes — Ontario, Quebec, Nova Scotia, and New Brunswick — and it was not until 1873 that little Prince Edward Island, the garden of the Gulf of St. Lawrence, united its political fortunes with those of the young Dominion. Efforts were made to bring in Newfoundland, but local considerations have always prevailed in that island over national sentiment, and it is still doubtful when this large colony, which has been placed by nature as a sentinel at the very portals of Canada will fall into line with its sister colonies in North America. One of the most important results of confederation in its early days was the annexation by the Dominion of that vast tract of country which up to that time had been almost exclusively in possession of the Indians and the traders of the Hudson Bay Company. Next came into confederation the province of British Columbia, which extends from the Rockies to the waters of the Pacific Ocean.

A new province of Manitoba, which is watered by the Red and Assiniboine rivers, and territorial districts as large as European states, were organized for purposes of government in the vast prairies of the west. Within a period of 30 years Canada has stretched from the Atlantic to the Pacific, and the territory now under her control is very little inferior in extent to that of the great republic to the south, and contains within itself all the elements of a prosperous future. It is unfortunately true that this result was not achieved until blood had been shed and much money expended in crushing the rebellious half-breeds led by Riel; but, apart from this sad feature of Canadian history, this important acquisition of territory has been attained under circumstances highly advantageous to the Dominion. Canada now possesses an immense territory of varied resources — the maritime provinces with their coal, fish, and shipping, together with a valuable, if limited, agricultural area, not yet fully developed; the large province of Quebec, with ranges of mountains on whose slopes, when denuded of their rich timber, may graze thousands of cattle and sheep, with valuable tracts of meadow lands, capable of raising the best cereals, and the finest cattle of the continent; the rich province of Ontario, the chief agricultural section of the Dominion, whose cities and towns are full of busy industries; the vast Northwest, still in the very infancy of its development, destined to give the Confederation several provinces outside of Manitoba, as large and productive as Minnesota, and to be the principal wheat-growing district of Canada; and, finally, the gold-producing province of British Columbia, whose mountains are still rich with undeveloped treasures, and whose mild climate invites a considerable industrious population to cultivate its slopes and plateaus and collect the riches of its river and deep-sea fisheries. Even that inhospitable Arctic region of the far northwest of Canada, through which the Yukon and its tributaries flow, appears to be rich with untold treasures of gold and other minerals, and promises to be a source of wealth to a country which is still in the infancy of its material development.

The people of the Dominion are well provided with facilities for every grade of education. The universities — notably those in Montreal and Toronto — stand deservedly high in the opinion of men of learning in the United States and in the Old World, while the grammar and common school system in the English-speaking provinces is creditable to the keen sagacity and public spirit of the people. In French Canada there has developed of late years an essentially literary activity, which has produced poets and historians — Ferland, Garneau, Crémazie, Fréchette — whose works have naturally attracted attention in France, where the people are still deeply interested in the material and intellectual development of their old colony. The successes of English writers have been

chiefly won in scientific and constitutional literature — especially by Dr. Todd and Sir William Dawson. The handsome volumes published by the Royal Society of Canada — established by the present Duke of Argyle when governor-general — give evidence of the intellectual activity of the best minds both of the French and English-speaking people. Bliss Carman, Charles G. D. Roberts, Wilfrid Campbell, Frederick George Scott, Duncan Campbell Scott, Archibald Lampman, and Ethelwyn Wetherald merit a high place on the roll of American poets. Sir Gilbert Parker has made Canadian romance popular on two continents. 'Sam Slick, the Clockmaker,' and other books by Judge Haliburton, a Nova-Scotian, are still the only noteworthy evidences we have of the existence of humor among a practical people, and his 'Wise Saws' and 'Sayings' were uttered more than 60 years ago. In art we have L. R. O'Brien, George Reid, John Hammond, Homer Watson, Robert Harris, J. W. L. Forster, W. Brymner, and Miss Bell, who have done much meritorious work.

Self-government now exists in the fullest sense of the term throughout the Dominion, as the result of the political struggles of 100 years. At the base of the political structure lie those municipal institutions which enable a people in every local division to make improvements, support schools, and even encourage public libraries. Then we go up higher to the provincial organizations, governed by a lieutenant-governor, nominated and removable by the government of the Dominion, and advised by a council responsible to the people's representatives; with a legislature composed, in only two of the provinces, of two houses — a council appointed by the Crown and an elective assembly — while in all the other provinces there is simply an assembly, chosen by the people either by universal suffrage or on a very liberal franchise. The fundamental law known as the British North America Act, which was passed by the Imperial Parliament in 1867, gives jurisdiction to the provincial governments over education, provincial works, hospitals, asylums, and jails, administration of justice (except in criminal matters), municipal and all other purely local affairs. In the territories not yet constituted into provinces there is provided an efficient machinery, each territory having a lieutenant-governor, appointed by the Dominion government; an advisory council to assist the lieutenant-governor, and a small legislative body of one house, elected by the people, which has the power of passing, within certain defined limits, such ordinances as are necessary for the good government and security of the still sparsely settled countries under its jurisdiction. In the Dominion Parliament, the representatives of the territories have all the rights and privileges of members of the organized provinces.

The government has jurisdiction over trade and commerce, post-office, militia and defense, navigation and shipping, fisheries, railways and public works of a Dominion character, and all other matters of general or national import. The appointment of a governor-general by the Crown, the power of disallowing bills which may interfere with imperial statutes and treaties, the right which Canadians still enjoy of appealing to the judicial committee of the privy council from the courts of the provinces, as well as from the supreme court of Canada; the obligation which rests upon England to assist the colony in time of danger by all the power of her army and fleet, the fact that all treaties with foreign powers must necessarily be negotiated through the imperial authorities — these are the most patent evidences that Canada is still a dependency of the empire. Even the restraint imposed upon Canada with respect to treaties has been modified to a great degree by the fact that England has acknowledged for 30 years that Canada should be not only consulted in every particular, but actually represented in all negotiations that may be carried on with foreign powers affecting her commercial or territorial interests. One of the most encouraging results of this political system has been not merely the material development of the Dominion, but the creation of that powerful national sentiment which best enables the whole political structure to withstand successfully any racial or party antagonisms which may put it to the test. French Canada, with its population of more than 1,250,000 people, still maintaining their language and special institutions, is no longer restive and uncertain of its future as in the years immediately preceding and following the rebellion. It is true that at times a spirit of antagonism is evoked between the French and the English elements, but the unfortunate state of things that existed before 1837 is no longer likely to return, and whatever jealousies or rivalries break out now and then above the surface are sooner or later carried away by a current of sound public opinion, anxious for the harmony of all classes and creeds, and only solicitous for the safe working of the union.

The next great step in the political career of Canada is a question which frequently occurs to Imperial as well as Canadian statesmen. It is not annexation to the United States — that is impossible; it is not independence — that is not even discussed under existing conditions. These are days of a dominant imperialism throughout the British empire, and the influence of that sentiment in Canada can be estimated from the enthusiasm with which Canadians rallied to the aid of England in South Africa. One thing is quite certain, that the national movement among all British-speaking people — indeed, among all such thoughtful French Canadians as Sir Wilfrid Laurier — is toward the placing of the relations between the parent state and its great dependencies on such a permanent basis as will strengthen the empire and give Canada even greater influence in the councils of the imperial state. SIR J. G. BOURINOT.

Cañada, kä-ñä'da, a Spanish term used to indicate a small cañon, or valley with steep rocky walls. The word was in use during the Spanish occupation of the Pacific coast and is still retained in the names of a few localities in New Mexico or California.

Canada Balsam, a pale balsam, resin, or oleoresin, obtained by incision from a Canadian tree, the American silver-fir, sometimes called the balm-of-gilead fir (*Abies balsamea*). Canada balsam is of the consistence of thin honey, drying slowly by exposure to the air into a transparent adhesive varnish. It is used to mount objects for the microscope, and for other optical purposes, its refractive power and transparency being equal to glass. Thus, when it is

sought to cut thin a piece of fossil wood, or anything similar, so as to subject it in favorable circumstances to microscopic examination, it is affixed to a more massive body by Canada balsam.

Canada Goose (*Branta canadensis*), the most abundant and generally distributed wild goose of temperate North America, breeding in the northern United States and the British provinces wintering in Mexico; an important game bird. Length about three feet; brownish gray above; ashy gray below; head, neck, bill, and feet black; a white patch extending over the chin and cheeks.

Canada Hemp, or **Indian Hemp,** a perennial herb, *Apocynum cannabinum*, of the dogbane family (*Apocynaceæ*), a native of North America. It has a strong fibre used by the Indians for twine, nets, woven fabrics, etc. See APOCYANACEÆ.

Canada Jay. See JAY.

Canada Rice, a floating grass (*Zizania aquatica*), growing in lakes and sluggish streams in Canada and the northern United States, yielding a grain that forms part of the food of the Indians, and is eaten by whites also. It is also known as wild, water, or Indian rice.

Canada Snake-root. See ASARUM.

Canada Sparrow. See SPARROW.

Canada Thistle. See THISTLE.

Canada Warbler. See WARBLER.

Cana'dian Embroidery, a kind of embroidery formed from small pieces of snake skin, fur, etc., intermingled with flexible pieces of split porcupine quills dyed in various colors.

Cana'dian Literature. See LITERATURE, CANADIAN.

Canadian Pacific Railway, a railway which crosses Canada from the Atlantic to the Pacific. One of the conditions upon which British Columbia entered the Dominion of Canada was the construction of such a railway. Eventually it was completed by a syndicate of capitalists, being opened for general traffic in June 1886. The Canadian Pacific Railway Company began by building a line connecting Winnipeg, Man., with the United States. At right angles to this line it started a line east and west from Winnipeg and in the course of two or three years had a line connecting Manitoba with Lake Superior at Fort William. With this original line in the middle of the continent as a nucleus the company extended its rails east and west, until it had a through line from Montreal on the St. Lawrence to Vancouver on the Pacific 2,900 miles long. When this through line was opened it was announced that the Canadian Pacific Railway was completed, whereas the actual fact viewed in the light of subsequent events was that the Canadian Pacific Railway was just begun. Branches were built covering the fertile productive wheat fields in Manitoba, until at the present time the Canadian Pacific has five parallel lines in the southwestern part of that province. In the east the company acquired lines carrying it from Montreal along the north shore of the St. Lawrence to Quebec and southwest from Montreal through the province of Ontario to Detroit. Eastward from Montreal railways were built or leased which carried the company across Maine and into New Brunswick and Nova Scotia, giving it ports on the Atlantic at St. John's and Halifax. At the west, in the mineral district of Alberta, lines have been built opening up the Slocan and Kootenay mineral districts and the coal deposits between Letchbridge and Crow's Nest. This latter line when complete will make a cut-off parallel to the main line, but just north of the international boundary. In addition to this development in Canada the company acquired control of the Minneapolis, St. Paul and Sault Ste. Marie Railway and the Duluth, South Shore and Atlantic Railway, in the United States. The Duluth, South Shore and Atlantic Railway begins at Sault Ste. Marie and runs west parallel to the south shore of Lake Superior, passing through the great Michigan copper deposits to Duluth. The Sault Ste. Marie Railway, with the same easterly terminus as the Duluth-South Shore, extends southwest to the twin cities of Minneapolis and St. Paul and then turns northwestward through Minnesota and North Dakota, and meets a branch of the main Canadian Pacific at North Portal. The total mileage of the system in 1893 was:

Canadian Pacific Railway	8,646 miles
Minneapolis, St. Paul and Sault Ste. Marie Railway	1,412 miles
Duluth, South Shore and Atlantic Railway	565 miles
Total of Canadian Pacific System	10,623 miles

The traffic of the Canadian Pacific Company is as diversified as the territory which it serves. Traffic returns as shown in the reports are not compiled on the same basis as the returns made by railways in the United States; that is, the table does not show the total tonnage of each class of freight, but the following table is of interest as showing the magnitude and diversity of its traffic, and the increase for the year ending 30 June 1902, over the preceding year:

	1901.	1902.
Flour (barrels)	3,735,873	4,921,993
Grain (bushels)	32,927,469	52,719,706
Live stock (head)	945,386	963,742
Lumber (feet)	899,214,646	1,033,569,377
Manufactured articles (tons)	1,945,386	2,288,234
All other articles (tons)	2,206,970	2,571,136
Total tons carried	7,155,813	8,769,934
Earnings per ton per mile	0.79 cents	0.75 cents
Number of tons carried one mile in	1901.	2,383,633,945
Number of tons carried one mile in	1902.	3,247,922,167

Passenger receipts per train mile amounted to $1.32 and freight receipts per train mile to $1.83, which are very high averages, when the large number of branch lines with light traffic which are worked is considered.

Canadian River, a river that rises in the northeast part of New Mexico, and runs generally east through Texas and Indian Territory to the Arkansas. Its length is about 900 miles, but it is rather shallow and not important for navigation. Its largest tributary is the Rio Nutria, or North Fork of the Canadian, which runs parallel to the main stream for about 600 miles.

Canadian Series, the lower of the two series into which the rocks of the Ordovician system are divided by American geologists. It comprises the Chazy and calciferous stages, principally limestones, and grades upward into the Trenton. See ORDOVICIAN.

Canadian Soldier, a pestiferous fly which annually visits, in the months of June and July, the cities near the Canadian border in the lower lake region. It travels in swarms, dashes against

the electric lights, and perishes by thousands. The same insect is known in other parts as the May-fly, water-fly, and shad-fly.

Canadian Turpentine. See CANADA BALSAM.

Canaigre, kăn-ā'gr, a species of dock (*Rumex hymenosepalus*) indigenous to the arid region of southern California, Arizona, New Mexico, northern Mexico, and western Texas. It is a perennial herb with tuberous roots from which a reddish or green stem rises to a height of about two feet and bears rather large leaves resembling those of other docks. The tubers, which resemble those of dahlia, have long been used locally as a source of tannin, and fairly successful attempts have been made to grow them upon a commercial scale for this purpose. Propagation is easily effected by means of the tubers, about 2,000 pounds of which are required to plant an acre. Preparation of the land and cultivation are the same as for other root crops, but harvesting is usually delayed until after the plants have become dormant. This is because the proportion of tannin to waste is greater than at the time the tops die. The season of active growth is during late winter and early summer, when the dormant season commences. The yield of roots often exceeds ten tons. For market the roots are either sliced and dried, or the tannin is extracted and concentrated. Fine leather is obtained from this kind of tannin.

Canajoharie, kăn-ạ-jō-hă'rẹ, N. Y., a village in Montgomery County, 55 miles northwest of Albany and about 9 miles north of Sharon Springs, on the south bank of the Mohawk River and on the Erie Canal. The town has two banks, a library, three weekly newspapers, machine shops, flour mills, planing mills, a brewery and manufactories of trunks, carriages, refrigerators, paper bags, and gloves. In the vicinity are stone quarries. Pop. 2,000.

Canal Dover, Ohio, a city of Tuscarawas County, situated on the Tuscarawas River and the Ohio Canal, and on the Pennsylvania and other railroads. There are deposits of coal, iron, and building-stone in the vicinity. The chief industries are in iron and steel, and the manufacture of racing-sulkies, baby-carriages, roofing, etc. Pop. (1900) 5,422.

Canal Du Mide. See CANALS.

Canal Ring. See TILDEN, SAMUEL J.

Canale, Nicolo, nē-kō-lō' kā-nā'lĕ, Venetian admiral, who flourished in the second half of 15th century. In 1469 he was commander of the Venetian fleet at Negropont (the ancient Chalcis), and succeeded in seizing the Turkish town of Enos. The cruelties perpetrated upon the inoffensive inhabitants created great indignation at Constantinople, and Mohammed II., with a view of resenting the outrages, besieged Negropont with a force of 120,000 men, and after a violent contest expelled the Venetians. Canale, to whom this defeat was attributed, was sentenced to death by the council of ten, but at the instance of Pope Paul II. and of other influential persons, his punishment was commuted to exile for life.

Canaletto, kā-nā-lĕt'tō, or **Canale, Antonio,** Venetian painter: b. Venice, 18 Oct. 1697; d. there, 20 Aug. 1768. He is celebrated for his landscapes, which are true to nature, and his architectural paintings. He is said to have first used the camera obscura for perspective.

Canaletto, Bernardo Belotti, bĕr när'dō bẹ-lŏt'tē, Venetian painter: b. 1724: d. Warsaw, 1780. He was nephew of Antonio Canaletto (q.v.), who was likewise a good artist, and painted many Italian landscapes. He lived in Dresden, where he was a member of the Academy of Painters.

Canals. Navigation canals, as distinguished from power or irrigation canals, may be classified in various ways. One is according to their magnitude, and the consequent traffic for which they are intended; as boat and barge canals, or ship canals. Or again, according to their source of supply; as pure canals, mere artificial cuts with no water but what is turned into them; tidal canals, varying with ebb and flow; and canalized rivers, with weirs to increase depth and a lock at one end, and if necessary, lateral cuts around falls or other obstructions. Or according to their geographical purpose: as isthmian canals, like those across Suez, Panama, and Corinth; peninsular, to save distance or a stormy passage, as those across Jutland, the Languedoc Canal from the Bay of Biscay to the Mediterranean, the Caledonian, the Chesapeake & Delaware (bays) across Delaware, etc.; canals around falls, as the Welland, Sault Ste. Marie, Ohio Falls, etc.; system-joining canals, as those connecting the Danube and Rhine, the Seine and Loire, Lake Erie and the Ohio or the Hudson, Lake Michigan and the Mississippi, the St. Lawrence and the Ottawa or Lake Champlain, etc.; or artificial-seaport canals, as the Manchester & Liverpool, to give inland cities access to the sea. Practically, however, the first is the only very useful one.

The chief problems in the construction and operation of a canal are: (1) To proportion its dimensions to the probable volume of traffic, in order to save interest, maintenance, and operation charges. (2) To give it the shortest and most easily constructed route, and the best lines and form, consistent with the cheapest maintenance and operation. (3) To provide and regulate a constant supply of water. (4) To shift vessels from one level to another most speedily and cheaply and with the least waste of water. (5) To gain the maximum of speed with the least injury to the embankment.

1. American and English barge canals have very largely gone out of use since the advent of railroads; and it is agreed that a principal reason is the small cargo they can float, making the expense of freightage heavy in proportion. As the operating expense of canals with thrice the carrying capacity is less than half as much again, it is certain that with enlarged size and a full business a great reduction in freight rates would be possible. But the latter clause is the dubious part: if the traffic were not commensurate, the added expense would still further handicap them as business ventures. It is therefore a very nice question exactly how large to make a canal; and has hitherto proven insoluble, except to large communities, which can afford to sink a part of the expense in the general «plant» of their industrial appliances.

2. A canal cannot, like a highroad or a railroad, have «grades.» Each level must be absolute until a new one is established; and it

must follow hills and valleys as it finds them, tunnel the former and build aqueducts across the latter or the river-courses, and change levels when needed. But locks are expensive both to build and operate, and delay traffic; the fewer the better on all grounds. It is therefore often thought cheaper in the long run, and a saving of time in transit, to take a longer route and save locks. The soil is also to be considered: rock or hardpan costs more to excavate, and a longer route may furnish cheaper cutting. On the other hand, in hard ground, the cut can be more nearly vertical and less excavation be needed. In soft ground the sides must have a heavy slope or they will cave, so that the top may be from two to two and a half times as wide as the bottom; in all ordinary ground some slope is needed; in rock cutting the sides are nearly or quite vertical, as also in passing through towns, where the sides are of masonry and space is a desideratum. The question of route is therefore anything but a simple one, and is complicated with many business and mechanical ones. The number of bridges, aqueducts, culverts, etc., to be built is an important consideration. The width must be sufficient to allow two of the largest vessels to pass abreast without fouling, and the narrower the way the more traction power is needed. The width of bottom is usually fixed at the beam width of two vessels, and the depth at 18 inches more than their draft. The excavation of canals is carried on like other large excavations, with machinery from the ordinary pick and shovel, scraper, and cart, to great steam excavators and dredges, powder and dynamite for rock blasting, and portable railroads for carrying off the material excavated, etc. Aqueducts have always masonry foundations or piers, supporting a trough of masonry, wood, or steel. When the interfering stream is small, it is carried under the canal by a culvert.

3. The provision of a supply of water might well be placed first, as the canal would be useless without it. If possible, the location is chosen so as to fill its summit levels from sufficient lakes or streams. Otherwise artificial reservoirs must be constructed, with all the care needed for the water supply of towns except as to quality. The drainage basin must be ample to supply loss of water by evaporation, leakage, and lockage, with reference to length of canal, number and size of locks, and volume of traffic; and the feeders properly calculated as to length and size. When an elevated supply is not to be had, pumping works take their place. Of the causes of wastage mentioned above, evaporation cannot be lessened. Leakage is prevented in porous soil by cementing or puddling the sides of the canal. But lockage is the constant drain on the supply, which has exercised much ingenuity in minimizing. One method of preventing waste is also connected with the regulation of overflow: to keep a "ladder" of locks far enough apart, say 100 yards, so that the discharge from upper to lower level shall not overspill: or an intervening pond must be formed. As overflow not only wastes, but may cause heavy damages and suits, and also injures the towpath, waste-weirs should be provided at convenient distances; and as a break would drain the entire reach before it could be repaired, these must be localized by stop-gates at short distances, making only a small basin to waste and do damage with its water. The towpath must also be so sloped and prepared as to prevent its soaking and miring or crumbling.

4. The lock is the chief agency for shifting boats from one level to another. Its principle is to open a small basin with one closed end into a larger one, thus raising or lowering the water of the smaller to the level of the larger without much affecting the latter. In practice, the lock is a chamber with its sides at the upper level and its bottom at the lower; and to save water, it is made as nearly as possible the size of the largest vessel that is to use it, with six inches to a foot of play at each side and end. The lateral walls in the more important canals are of stone. The ends are wooden or iron folding gates, opening up-stream; each made of two leaves pivoted in the walls, each leaf a little more than half the width of the lock, so that they shut together at an obtuse angle against the current, the weight therefore only serving to close them still tighter. When a vessel is to be brought from one level to the other, it is floated into the basin or "pound," and the gate shut behind it. A sluice or valve in the upper gate then admits water and slowly raises it to the upper level, or the one in the lower gate lets it down to the lower level, as the case may be. The total lockage takes all the way from 6 to 20 minutes. These sluices are worked by rack and pinion in the gate, or revolve on an axis; they are managed by long levers set in the top of the gate, and reached by a "running board" projecting over it. The gates themselves are also managed by levers except in the better equipped and important ones, where they are often worked by steam machinery, at a saving of half the time. To save time and expense of superintendence, the reaches are made as long as possible, and the locks bunched in one spot in "ladders" of several close together, like a flight of steps, with a high lift, rather than scattered along the route. As said above, these should be some way apart to prevent overflow. As the pressure on the gates and sides is very great, the limit of "lift" in a lock, or the vertical height to which the water is raised, averages not over eight or nine feet, and may be only three or four; though 12 is not very uncommon, and 18 has been attained at the Sault Ste. Marie. On the largest locks the water is admitted through a culvert parallel to the side wall of the lock, and opening into the centre through a tunnel; this is said to reduce the time of lockage considerably. Of course too sudden an admission of water would injure the boat. Pipes are also used.

It is evident that at each passage of a boat, the upper level has to supply water enough to fill the lock between it and the lower. It may be noted that the ascending traffic takes far more than the descending, because in the latter case the water displaced by the boat itself flows back into the upper reach, and remains there after the gates are shut. A 25-ton boat with an eight-foot lift costs 163 tons of water going up and 103 coming down. To economize this supply where water is scarce, two chief plans have been devised. One is to form at the side of the lock a reservoir equal in size. When the lock is to be emptied, the water is run into the reservoir until it and the lock are at the same level, which of course will be half height. The reservoir is then closed, and the remaining water in

the lock run off through the lower sluices in the usual way. On refilling the lock, before opening the upper sluices, one fourth the quantity required can be obtained from the reservoir, thus saving 25 to 40 tons of water at each passage. This delays the traffic, however, and has not been much used. Another method is now coming into use in the canals of largest traffic, at the spots where a number of locks are bunched, and therefore a great amount of water used and time consumed. This is a reversion to the oldest historic type, of lifting the boats by machinery instead of floating them up; except that instead of inclined planes for hauling up and gravity for letting them down, hydraulic vertical lift locks are used. In this system the lock is a chamber with gates and water, as in the other; but it is movable, and when the boat is run into it, is raised or lowered to level. Counterweights and flotation tanks are sometimes used to aid the hydraulic power. The first of these was built at Anderton on the Weaver River, England, in 1876; lift, 50 feet 4 inches; two troughs 75 by 15 by 5; hydraulic ram, with three-foot plunger. This lets through a 100-ton boat in a total lockage time of eight minutes, and takes the place of six ordinary locks, which would take at least an hour, and on an average considerably more. The next was at Les Fontinettes, northwest France, on the Neufossé Canal, connecting the North Sea ports with Paris; lift, 43 feet 1 inch; two troughs 139 feet 7 inches by 18 feet 4½ inches by 6 feet 10⅝ inches; hydraulic ram, 6 feet 6¾ inches plunger. This lets through a 300-ton boat in 20 minutes, and replaces five locks taking two hours. At La Louvrière, Belgium, on the Canal du Centre, connecting Mons with Brussels, there is a fall of 293 feet in 17 miles, and 213 of it in five miles. This has been overcome by five lifts, with hydraulic rams having plungers of 6 feet 6¾ inches, operated by turbines turned by the upper-level water; height of lift from 50½ to 63⅔ feet. Each of these has two troughs of 141 feet 1 inch by 19 feet ¼ inch by 8 feet 6 inches, and takes up 400-ton barges in 15 minutes. At Lockport, N. Y., on the Erie Canal, the original nine and later five double locks, with a lift of 54 feet 5 inches, have been replaced by a hydraulic balance, working two troughs 225 feet by 19 feet 2 inches by 9 feet, and raising 400-ton boats in 15 minutes of lockage, against half an hour to an hour and a half of old. Others are either built or building.

5. The maximum of speed thus far found compatible with safety and economy on canals is from three and a half to four miles. Higher speed not only involves much greater proportionate power for traction on account of the resistance in a narrow way, but injures the embankment by the wash of the waves. Even on a navigable small river, a steamer at eight or nine miles an hour will cut the banks badly; and it would destroy those of a canal, unless faced more solidly than is commercially practicable. Furthermore, if the canal were worked to its full capacity, the traffic would not be expedited unless lockage could be shortened. The question of power for hauling the boats has been variously solved. Sometimes men draw the boats by ropes from the towpath, sometimes they row the boats direct,—this mostly in China; most often animals on the towpath draw them with ropes, singly or in tows; sometimes locomotives replace the animals, and in one place (the Muscle Shoals Canal on the Tennessee) the locomotives exchange boats when they meet; on the Erie and the Delaware & Raritan, steam propellers are used; in still others, especially on the continent of Europe, the power is from a cable or an endless chain along the bottom of the canal, either gripped by the boat or wound over a drum on the bottom of the boat.

Historical.— The earliest artificial water channels were for irrigation and drainage; not to reclaim swamp land, other soil being too plentiful, but to regulate the overflow of rivers. These date from an immemorial past, certainly 3500 B.C. in Babylonia and Egypt, more probably 7000 at least. Very early also the larger ones must have been used for boat navigation, to transport agricultural and building materials; these combined drains and canals still exist in England, called "navigations," and the workers on them "navigators," and have given to the language the word "navvy" for construction laborers. At what period the first ones were dug primarily for navigation, and incidentally for irrigation, cannot be told. There is a tradition that the Suez Canal was dug under the Old Kingdom of Egypt before 2000 B.C.; it was certainly opened or reopened for small boats by Necho, about 600 B.C. About this time also Nebuchadrezzar of Babylon opened the Royal Canal between the Tigris and Euphrates, but Mesopotamia had been well canalized before. These two countries, indeed, invited canals, with their flat surface and long levels, and easy digging in sand or clay. It is probable that China also had canals before the Christian era, but evidence is wanting. The first canals were of course on one level; but with the light boats and great engineering skill of the ancients the step was not long to damming the water at different levels and hauling the boat over. The first system, not yet disused, was to pull the boat up an inclined plane and let it down by gravity; and this remained the only available method till modern times. Under Alexander and his successors in Egypt and the Seleucid empire, canals were much used: an important one was from Alexandria to the Nile, whose mouths were shut off by sandbars. Marius had one constructed 102 B.C. from the lower Rhone to the Mediterranean. Under Claudius there was one from the Tiber to the sea; and in Great Britain there are two which date from the Roman time, the Foss Dyke and the Caer Dyke, in Lincolnshire, of 40 and 11 miles respectively. In the 4th century Lombardy was canalized,—a very favorable spot from its great plain and many rivers; and near the end of the 5th century, Odoacer carried one from the Adriatic to Mentone above Ravenna. The downfall of Roman civilization stopped their development for a while; but under Charlemagne a fresh extension began, that monarch building canals to connect the Danube both with the Rhine and the Black Sea. In the Netherland bogs the system is that of nature itself, and began very early; here the canal is not so much an artificial channel as a remnant of the original sea, around which the land is built. In Britain as early as 1121, Henry I. deepened and made navigable the old Foss Dyke. The Grand Canal of China, about 1,000 miles long, a large part of it made up of canalized rivers, was completed

in 1289. That country has many other great systems connecting its internal waterways.

But obviously the boats transferable by such machinery must be small and lightly loaded; and the modern canal system, with long heavy boats and large cargoes, was first made possible by the invention of the lock. This doubtless developed out of putting dams close together with gates in them; but neither inventor nor even country of first use is certain. It has been claimed for two brothers, engineers of Viterbo in Italy, in 1481; also for Leonardo da Vinci the universal genius; and again for Holland a century earlier. The one certain fact is, that in the latter part of the 15th century they were in use in both countries, and spread rapidly through Europe. The first country to undertake on a large and systematic scale the connection of its leading systems by canals was France, in the 17th century. The Brière Canal, connecting the Seine and Loire, was begun in 1605 under Henry IV., and completed 1642 under Louis XIII. The Orléans Canal, uniting the same basins by the Loing, was completed 1675, under Louis XIV. The greatest of all, the Languedoc Canal, to connect the Bay of Biscay with the Mediterranean, was finished 1681. It is 148 miles long, 6½ feet deep, with a summit level of 600 feet; has about 119 locks and 50 aqueducts, and floats barges of 100 tons. France in 1879 passed a law making all its canals uniform at 6½ feet deep, with locks 126½ feet long by 17 wide. England was much later in taking up the system on a large scale, but when it did so, carried out a remarkable one, with great feats of engineering. The fathers of it were Francis Duke of Bridgewater and his famous engineer, James Brindley; and the beginning was the charter for the Bridgewater Canal in 1759. The names of Watt, Telford, Nimmo, Rennie, and other noted engineers are associated with it. The last inland canal in Great Britain was built in 1834. Among the leading ones are the Grand Junction, 128 miles; Leeds & Liverpool, 128; Trent & Mersey, 93; Kennet & Avon, 57. The great Irish canals are the Grand Canal, from Dublin to Ballinasloe, 164 miles, uniting the Irish Sea to the Shannon; and the Royal Canal nearly parallel to it for the same traffic, from Dublin to Torinansburg, west of Longford. The great canals of Scotland are the Caledonian and the Forth & Clyde, spoken of under *Ship Canals*. Early in the 18th century Peter the Great constructed a great system of canals and canalized rivers, 1,434 miles long, to connect St. Petersburg with the Caspian. The Danish Canal, 100 miles long, from the North Sea to the Baltic, was finished in 1785. The Gotha Canal, 280 miles long, connecting Stockholm with Gothenburg across Sweden, was planned 1716, but opened the first part 1810, the whole 1832. In 1836–46 Louis of Bavaria revived Charlemagne's old plan, connecting the Main (and so the Rhine) with the Danube, by a canal 108 miles long, 650 feet above the Main, and 270 feet above the Danube.

United States Boat Canals.— The first canal in this country was built in 1793, around the falls of the Connecticut River at South Hadley Falls, Mass.; the engineer was Benjamin Prescott of Northampton, afterward superintendent of the Springfield Armory. The lift was not by locks, but by inclined planes, the boats being run into a movable caisson, filled with water and hauled up by cables operated by water-power; locks were introduced later. In 1796 a canal was completed around Turner's Falls farther north in the same river, at Montague. "The Proprietors of the Locks and Canals on Merrimack River" were incorporated 1792, and opened their canal around the falls at Lowell to the mouth of the Concord, one and a half miles long and with four locks, in 1797; it was for the lumbering business, rafts, masts, etc. But the first general canal for passengers and merchandise opened in the United States was the Middlesex, a rival to the last, incorporated 1793, and completed 1804 at a cost of $700,000; it ran to Charlestown, 31 miles, was 24 feet wide and 4 feet deep, and fed by the Concord. A packet boat, the Governor Sullivan, plied regularly between Boston and Lowell, taking nearly a day. The first boat voyage to Concord, N. H., was made in 1814, and a steamer began passages in 1819. The canal was disused 1851. But much broader projects had been set on foot about the time of these local ventures; and several of the greatest afterward carried out, as well as some which have been chimeras rather from political developments than from any inherent impracticability, were broached even before the Revolution. Washington was deeply interested in canal schemes all through his life, and favored canals to connect all the great American water systems. The Potomac and Ohio, the James and Ohio, and the Mohawk Valley and Great Lakes connections, were all examined by him. The last named he looked over during the Revolution. In 1792 the Western Inland Navigation Lock Company was formed, and by 1797 had finished six miles of canals around the rapids at Little Falls, making a navigable way for 15-ton barges to Lake Ontario. Pennsylvania built several small canals in the two decades from 1790 to 1810, but they had little success. In 1784 Maryland and Virginia jointly granted a charter for a canal from Georgetown on the Potomac to the Alleghanies, under which up to 1822, when it was abandoned, some three quarters of a million dollars were spent in excavations, dams, and locks. But the great era of American canal-building, and of furious and losing canal speculation, was from 1810 to 1840; its definitive close was about 1850, since which year no boat canal has been built in this country except the Illinois and Mississippi. The entire system in the United States aggregates about 4,200 miles, nearly all in the belt from New York south to Virginia and west to Indiana. There are at present about 40 large canals in the United States, of which 14 are in Pennsylvania, 13 in New York, and 5 in Ohio. Some of the lines most important in their early days, and which gave great cities their start since confirmed by railroads, are now entirely disused; and a history of their fortunes would be of no more importance than of other bygone business ventures. Some of the leading existent ones, or those which may be only dormant, will be described.

Chesapeake & Ohio.— The fortunes of this system have shown how difficult it is to forecast business developments. As designed by Washington, it was to connect the Chesapeake and ocean navigation, by way of the Potomac, with that of the Ohio, by portages and high-roads from its terminus Cumberland at the foot of the Alleghanies; as a fact, its use has been

mainly from the accidental fact that Cumberland is near the Pennsylvania coal fields. The fortunes of the first company have been described. In 1823 commissioners appointed by Maryland and Virginia reported in favor of a new route in place of attempting to complete the old one; in 1824 the national system of internal improvements was inaugurated by act of 30 April, and a board of engineers in October 1826 reported on a canal from Georgetown to Pittsburg. As the cost was over $22,000,000, it was considered prohibitory then; and in 1829 the "eastern division" to Cumberland was authorized, by national, State, municipal, and private stock subscriptions. But the work had been inaugurated on 4 July 1828 by President J. Q. Adams, who struck the first spade; and it was fully opened in 1850. It is 184 miles long and 6 feet deep, 60 feet wide from Georgetown to Harper's Ferry, and 70 on an average from thence to Cumberland. It is fed from the Potomac by seven dams. The aqueduct at Georgetown over the Potomac was a very considerable engineering feat for its time; it rests on 12 masonry piers constructed by coffer-dams on rock 28 to 40 feet below the surface. At Paw Paw Bend, 27 miles east of Cumberland, the canal saves six miles by a cut-off and tunnel through the mountain, 3,118 feet long. The summit level is 613¾ feet above tidewater; the rise is accomplished by 74 locks from 6 to 10 feet lift. The whole work had cost over $9,500,000 when opened, and its total capitalized outlay had been over $15,000,000 when the bondholders foreclosed in 1890.

Erie Canal.—The State of New York finally bought the works of the Western Inland, above mentioned. In 1803 Gouverneur Morris suggested or re-suggested a broader plan, to make a navigable way not to Ontario but to Erie, and therefore from the new West to New York. De Witt Clinton eagerly took up the idea, threw his whole energies into pushing it, and made it a foremost part of his political programme, bitterly opposed by the Tammany and Van Buren wing. In 1808 Simeon De Witt was appointed to survey the Mohawk route. On 3 March 1810 a commission was appointed, with Gouverneur Morris at the head and Clinton a member; it made several reports urging the feasibility and business advantage of the canal, and Clinton's memorial to the legislature in 1815 is said to have carried conviction. At any rate, on 7 April 1816 an act was passed authorizing the construction of the Erie and Champlain canals; on 4 July 1817 the first ground was broken, at Rome; and on 4 Nov. 1825, during Clinton's governorship, the canal was formally opened from Albany to Buffalo, 352 miles. It had cost $7,602,000, but it reduced the freightage time between the termini from 20 days to 10, and the passenger time shortly to 3½, by a line of light packet boats with relays of horses at a trot; and reduced freights at once from $100 a ton to $10, and then to $3. It made central New York, largely uninhabited, at once a district of potential empire with settlers flocking in; secured for New York the domination of the American seaboard; and created or solidified the prosperity of the remarkable line of cities in its path. Its construction was justly considered a triumph of engineering ability: several of the stone aqueducts by which it was carried over the streams (it crosses the Mohawk twice) presented peculiar difficulties, and in places it was cut through solid rock. It was at first 40 feet wide and 4 feet deep; later enlarged to 70 feet at top, 56 at bottom, and 7 feet deep; still further deepened as below. It has 72 locks, 110 by 18, 57 of them double. The chief lifts are at West Troy, 188½ feet, surmounted by 16 double lift-locks; at Lockport, 54½ feet, at first by nine double locks, then by five higher ones, since 1895 by a hydraulic balance lift (above described); and at Albany, 20 feet. It is fed from Lake Erie, the Black River, and several lakes in its course. The total rise to Buffalo is 568 feet, which means that the general fall of water is to the eastward. After the New York Central paralleled it, the business declined, and for many years after the war seemed doomed to extinction. In 1883 all tolls were removed on the State's canals, and the navigation made free; but even this did not wholly arrest the decline, due to reasons heretofore stated. It being evident that the Erie must be enlarged to be an effective competitor of the railroads, in 1896 a referendum was taken on an expenditure of $9,000,000 for deepening it to nine feet. In little more than a year from the time that work was begun, this money was exhausted, and the task but partly completed. Elaborate plans were devised for turning it into a great barge canal, navigable for vessels of 800 to 1,000 tons. It has been officially estimated that this will cost $101,000,000, or $40,000,000 more than all the outlays upon the canal to date. The proposition was presented to the people in November 1903, and was carried by a popular majority of 250,000 votes.

Illinois & Michigan Canal.—This route connects the Mississippi system with the Great Lakes, and by the Welland Canal with the St. Lawrence. Its inevitability was plain by reason of the extensive use of the Chicago portage (from the Chicago River to the head-waters of the Kankakee, an affluent of the Illinois) by the Indians and trappers, it being only half a mile for boats, the shortest important portage on the continent. Chicago was one of the best trodden sites in America before white men came here. As early as 1822 Congress granted a right of way for such a canal, and in 1827 and 1854 made further grants. For some reason it hung fire for many years, though a host of surveys and estimates were made by the State and the nation. Work was prosecuted on it 1836–41, then suspended till 1845, and the canal was finally opened in April 1848. It had then cost $6,170,226. The western terminus is La Salle, at the head of steamer navigation on the Illinois River; its eastern is on the south branch of the Chicago, about five miles from its mouth in the city. The entire length is 96 miles, and the rise from La Salle to Lake Michigan is 145 feet, surmounted by 17 locks, 110 by 18; the capacity of boats is 150 tons. The original intention was to make a straight cut from Lake Michigan to the Des Plaines River, the chief branch which with the Kankakee forms the Illinois; but to save expense it was decided to use the Chicago River instead. Thence it runs to Summit on the Des Plaines, 8 miles; then 42 miles to the junction with the Kankakee; thence through the Illinois valley to La Salle. It has five navigable feeders, the Calumet, Des Plaines, Du Page, Kankakee, and Fox; and five large storage basins. The sum-

mit level at Bridgeport required pumping for supply; and two steam engines, delivering 15,000 cubic feet of water per minute, were used till 1870. These were also used for many years to help draw off the sewage of Chicago, which empties for miles into the river. By supplying the canal from the river, the lake water was drawn in to fill the vacancy, and so kept the river comparatively sweet. But the system was expensive, and the canal was deepened for some years, ending 1870, to carry the sewage by its own flow to the Des Plaines, reversing the current of the river. It proved insufficient, and in 1892 the Chicago Drainage Canal (q.v.) was begun, which was finished in 1900. It is 40 miles long to Joliet, 22 feet minimum depth, and 162 to 290 feet wide at top. A scheme has been mooted for years, to convert this into a huge ship canal to enable ocean-going steamers to ascend from New Orleans to Chicago, and so through the Great Lakes and to the St. Lawrence; but it depends on the co-operation of the national government. Another canal to connect the Mississippi and Lake systems, which has been under construction since 1892, is the Illinois & Mississippi, the only barge canal started for over half a century. It is a supplement to the Illinois & Michigan; running from Hennepin on the Illinois River, a little beyond La Salle, to the Rock River, 50 miles, and then by 27 miles of slack-water navigation down that river to Rock Island, Ill. It is to be 80 feet wide and 7 feet deep, with 37 locks.

James River & Kanawha Canal.— This is a line partly existent and partly on paper, but interesting as probably the oldest North American canal scheme. The idea is accredited to Gov. Spotswood in 1716, when he explored the Blue Ridge; but the first active part was taken, as in all these early ventures, by Washington, who saw from his backwoods days the necessity of joining the eastern seaboard to the trans-Alleghanian territory by lines of communication. He personally explored the James River route in 1784, and induced the Virginia legislature on 5 Jan. 1785 to pass an act for improving the navigation of the James. Under this the James River Company was organized, 25 Jan. 1785, with Washington as president. No work was done, and in 1835 another company of the same name took up its task; beginning the construction of the section from Richmond to Lynchburg in 1836, and completing it near the end of 1841. The second division, from Lynchburg to Buchanan on the upper James, was begun before this was opened, and completed in 1851. In 1853 an extension of 47 miles to Covington on Jackson River was begun, but the war interrupted it, and it has never been resumed. In 1874 the cost of completing it to the Kanawha, including an improvement of the navigation of that river, was estimated at $60,000,000.

The Ohio Falls Canal.— This is a short canal, but from its location a very important one; it makes continuous navigation in one of the chief waterways of the continent. The first canal was built 1825–30, and called the Louisville & Portland. It was 1 7-10 miles long, 64 feet wide, had 8⅔ feet lift, and three locks, one at the head and two at the foot. An enlargement was begun in 1861, but interrupted by the war; in 1868 the national government included it in its river and harbor appropriation, and it was opened February 1873, having cost about $4,000,000. It runs west from in front of Louisville, Ky., to Portland; is a little over 11,000 feet long and 86½ feet wide, with a minimum depth of 6 feet assured by a dam at the falls. The water in the river varies from 6 to nearly 43 feet, and earthen parapets on the sides of the canal rise to 44 feet, based on stone walls, themselves built on the limestone rock through which the canal is cut. The upper lock has been raised, the lower two left as they were, but a branch with two locks has been added. At the head are flood-gates 46 feet 11 inches high. The upper entrance is 400 feet wide.

Among others existent or of past importance are the canal between the Chesapeake and Delaware bays, across the Delaware isthmus, built 1824–9; 13½ miles long, and supplied by pumps for 10 miles of it. An enlargement has been projected. The Morris Canal, 101 miles long, built in 1830, connects the Hudson at Jersey City with the Delaware at Phillipsburg, N. J.; it is owned by the Lehigh Valley R.R. The Delaware & Raritan, 43 miles long, built 1831–4, connects those rivers, and therefore New York and Philadelphia. The Delaware & Hudson, completed 1820, was once the great coal freight route between New York and the Pennsylvania mines; its company transformed itself into the railroad company of the same name, and has abandoned the canal. The Schuylkill Coal & Navigation Company's canal is 108 miles long. The Ohio & Erie Canal from Portsmouth, Ohio, to Cleveland, and the Wabash from Toledo, Ohio, to Evansville, Ind., were once of importance in building up these sections. For the Sault Ste. Marie, see *Ship Canals* below.

Canadian Canals.— Canada has a very extended and important set of canal systems, which may be classified as follows: (1) The St. Lawrence and Great Lakes system; which includes the Welland across the neck of land to the west of Niagara Falls, carrying continuous navigation from Lake Superior to Lake Ontario, and the canals around the rapids on the St. Lawrence, between the Thousand Islands and Montreal, making unbroken passage from Duluth to the ocean. The Welland will be spoken of below. The system also comprises the Burlington Bay Canal, through a bar at the head of Lake Ontario; (2) the two Ottawa River systems, one around the falls on the river between Ottawa and Montreal, the other by the Rideau and Cataraqui rivers and the connecting Rideau Canal to the lower St. Lawrence; (3) the Lake Champlain and St. Lawrence navigation, by the St. Ours & Chambly, along the Richelieu River; (4) the Trent River system, intended to connect Ontario with Huron through the Trent, but not completed; (5) St. Peter's Canal, connecting the Bras d'Or in Cape Breton with St. Peter's Bay on the south coast. Several other very important ones are projected.

Ship Canals.— Great ship canals across isthmuses or peninsulas, to make shorter sea routes or avoid stormy passages, or surmount falls, or to make seaports of inland cities, have been the speculations of dreamers for ages; but the developed and hurried commerce of this age has made some of them imperative. The ship canals of the world are nine in number, as follows:

SAULT STE. MARIE CANAL.

M٩٥U

1. The Suez Canal, begun in 1859 and completed in 1869.

2. The Cronstadt and St. Petersburg Canal, begun in 1877 and completed in 1890.

3. The Corinth Canal, begun in 1884 and completed in 1893.

4. The Manchester Ship Canal, completed in 1894.

5. The Kaiser Wilhelm Canal, connecting the Baltic and North seas, completed in 1895.

6. The Elbe and Trave Canal, connecting the North Sea and Baltic, opened in 1900.

7. The Welland Canal, connecting Lake Erie with Lake Ontario.

8 and 9. The two canals, United States and Canadian, respectively, connecting Lake Superior with Lake Huron.

The Suez Canal is usually considered the most important example of ship canals, though the number of vessels passing through it annually does not equal that passing through the canals connecting Lake Superior with the chain of Great Lakes at the south. In length, however, it exceeds any of the other great ship canals, its total length being 90 miles, of which about two thirds is through shallow lakes. The material excavated was usually sand, though in some cases strata of solid rock from 2 to 3 feet in thickness were encountered. The total excavation was about 80,000,000 cubic yards under the original plan, which gave a depth of 25 feet. In 1895 the canal was so enlarged as to give a depth of 31 feet, a width at the bottom of 108 feet and at the surface of 420 feet. The original cost was $95,000,000, and for the canal in its present form slightly in excess of $100,000,000. The number of vessels passing through the canal in 1870 was 486, with a gross tonnage of 654,915 tons; in 1875, 1,494 vessels, gross tonnage, 2,940,708 tons; in 1880, 2,026 vessels, gross tonnage, 4,344,519 tons; in 1890, 3,389 vessels, gross tonnage, 9,749,129 tons; in 1895, 3,434 vessels, gross tonnage, 11,833,637 tons; and in 1900, 3,441 vessels, with a gross tonnage of 13,699,237 tons. The revenue of the canal is apparently large in proportion to its cost, the Statesman's Yearbook for 1901 giving the net profits of 1899 at 54,153,660 francs, and the total amount distributed among the shareholders 51,538,028 francs or about 10 per cent of the estimated cost of $100,000,000. The canal is without locks, being at the sea level the entire distance. The length of time occupied in passing through the canal averages about 18 hours. By the use of electric lights throughout the entire length of the canal passages are made at night with nearly equal facility to that of the day. The tolls charged are 9 francs per ton net register, "Danube measurement," which amounts to slightly more than $2 per ton United States net measurement. Steam vessels passing through the canal are propelled by their own power.

The canal connecting the bay of Cronstadt with Saint Petersburg is described as a work of great strategic and commercial importance to Russia. The canal and sailing course in the bay of Cronstadt are about 16 miles long, the canal proper being about 6 miles and the bay channel about 10 miles, and they together extend from Cronstadt, on the Gulf of Finland, to St. Petersburg. The canal was opened in 1890 with a navigable depth of 20½ feet, the original depth having been about 9 feet; the width ranges from 220 to 350 feet. The total cost is estimated at about $10,000,000.

The next of the great ship canals connecting bodies of salt water in the order of date of construction is the Corinth Canal, which connects the Gulf of Corinth with the Gulf of Ægina. The canal reduces the distance from Adriatic ports about 175 miles and from Mediterranean ports about 100 miles. Its length is about 4 miles, a part of which was cut through granite soft rock and the remainder through soil. There are no locks, as is also the case in both the Suez and Cronstadt canals, already described. The width of the canal is 72 feet at bottom and the depth 26¼ feet. The work was begun in 1884 and completed in 1893 at a cost of about $5,000,000. The average tolls are 18 cents per ton and 20 cents per passenger.

The Manchester Ship Canal, which connects Manchester, England, with the Mersey River, Liverpool, and the Atlantic Ocean, was opened for traffic January 1, 1894. The length of the canal is 35½ miles, the total rise from the water level to Manchester being 60 feet, which is divided between four sets of locks, giving an average to each of 15 feet. The minimum width is 120 feet at the bottom and averages 175 feet at the water level, though in places the width is extended to 230 feet. The minimum depth is 26 feet, and the time required for navigating the canal from 5 to 8 hours. The total amount of excavation in the canal and docks was about 45,000,000 cubic yards, of which about one fourth was sandstone rock. The lock gates are operated by hydraulic power; railways and bridges crossing the route of the canal have been raised to give a height of 75 feet to vessels traversing the canal, and an ordinary canal whose route it crosses is carried across by a springing aqueduct composed of an iron caisson resting upon a pivot pier. The total cost of the canal is given at $75,000,000.

Two canals connect the Baltic and North seas through Germany, the first, known as the Kaiser Wilhelm Canal, having been completed in 1895 and constructed largely for military and naval purposes, but proving also of great value to general mercantile traffic. Work upon the Kaiser Wilhelm Canal was begun in 1887, and completed, as above indicated, in 1895. The length of the canal is 61 miles, the terminus in the Baltic Sea being at the harbor of Kiel. The depth is 29½ feet, the width at the bottom 72 feet, and the minimum width at the surface 190 feet. The route lies chiefly through marshes and shallow lakes and along river valleys. The total excavation amounted to about 100,000,000 cubic yards, and the cost about $40,000,000. The number of vessels passing through the canal in 1900 was 21,571, with a tonnage of 4,282,258, and the dues collected amounted to 2,133,155 marks.

Three ship canals intended to give continuous passage to vessels from the head of Lake Superior to Lake Ontario and the St. Lawrence River are the Welland Canal, originally constructed in 1833 and enlarged in 1871 and 1900; the St. Mary's Falls Canal at Sault Ste. Marie, Mich., opened in 1855 and enlarged in 1881 and 1896; and the Canadian canal at St. Marys River, opened in 1895. In point of importance, measured at least by their present use, the canals at the St. Marys River by far surpass that of the Welland Canal, the number of vessels passing

through the canals at the St. Marys River being eight times as great as the number passing through the Welland, and the tonnage of the former nearly forty times as great as that of the latter. One of the important products of the Lake Superior region, iron ore, is chiefly used in the section contiguous to Lake Erie, and a large proportion of the grain coming from Lake Superior passes from Buffalo to the Atlantic coast by way of the Erie Canal and railroads centering at Buffalo. The most important article in the westward shipments through the Sault Ste. Marie canals — coal — originates in the territory contiguous to Lake Erie. These conditions largely account for the fact that the number and tonnage of vessels passing the St. Marys River canals so greatly exceed those of the Welland Canal. The Welland Canal connects Lake Ontario and Lake Erie on the Canadian side of the river. It was constructed in 1833 and enlarged in 1871 and again in 1900. The length of the canal is 27 miles, the number of locks 25, the total rise of lockage 327 feet, and the total cost about $25,000,000. The annual collection of tolls on freight, passengers, and vessels averages about $225,000 and the canal is open on an average about 240 days in a year.

Canaletto (proper name BERNARDO BELOTTO), Venetian painter: b. Venice 1724; d. Warsaw 1780. He was a pupil of his uncle, Antonio Canaletto, whose style he imitated perfectly. He worked in Dresden, London, and other places, and painted principally suburban buildings and scenes. He excelled in perspective.

Canaletto, Antonio, Italian painter of perspective views: b. Venice 1697; d. there 1768. In early life he was a scene painter, but having studied in Rome he returned to his native city and became an artist of note. He is said to have been the first who used the camera obscura in painting. His principal subjects, which are highly prized, are mostly views of the palaces and canals of Venice. As he was an extremely rapid worker and very industrious, he left a great number of works. His pictures of Venetian palaces and scenery, while greatly admired by some critics, are harshly censured by others, who consider his art as mere mechanism.

Canandaigua, N. Y., a village of Ontario County, 29 miles southeast of Rochester; at the northern end of Canandaigua Lake, and on the New York C. & H. R. and Northern C. R.R.'s. It is finely situated, on high ground, with a commanding view of the lake. The fishing and boating accommodations are excellent.

Industries, etc.— The chief manufactures are those of ale, pressed brick, and anti-rust tin and enameled ware. The Lisle Tin and Enamel Works have 600 employees, the Empire Pressed-Brick Works 150, the brewery 75. The power-house and shops of the Rochester & Eastern Interurban Electric railway, with 100 employees, are also located here.

Public Institutions, Buildings, etc.— The churches are Congregational, Episcopalian, Methodist Episcopal, Baptist, Presbyterian, Roman Catholic, and Wesleyan Methodist. There are two banks, with a combined capital of $200,000 and deposits of $1,200,000. Here are also located the Thompson Memorial Hospital, the Ontario Orphan Asylum (private), a private insane asylum, and an association library. It is also the seat of Canandaigua Academy, a public high school, and of the Granger Place School for Girls, a private secondary school.

Government.— The government is administered by a president, and a board of trustees of eight members, elected annually.

History.— Canandaigua was settled by New Englanders in 1789, and became a village in 1815. The name was originally Canandarqua, an Indian word signifying "the chosen spot."

Canandaigua Lake, N. Y., a body of water lying chiefly within the limits of Ontario County. It is 668 feet above the sea and 437 feet above Lake Ontario, and has an extreme length of 15 miles and an average width of one mile. Its outlet is the Clyde, a tributary of Seneca River. The waters abound in excellent fish.

Canani, Giovanni Battista, jō-vän'nē bät-tēs'tä kä-nä'nē, Italian anatomist: b. 1515; d. 1597. He discovered certain of the hand muscles, and was the first to observe the use of the valves in the veins.

Cananore. See KANANUR.

Canar, kä-fiär', Ecuador, a small province situated among the Andes, between the provinces of Chimborazo and Azuay; capital, Azogues. Pop. of province, 64,000.

Canard, ka-närd', or ka-när', a false report; a silly rumor. The origin of this use of the term is not known. It is the French word meaning "a duck," and is thought by some to be derived from the old phrase, *Vendeur de canard a moitie,* one who half-sells a duck or cheats in such a transaction; hence a liar, a guller, eac. According to an account of wide currency in different versions, the usage arose from a story of cannibalism among a flock of ducks that ate one of their number each day until they were reduced to a single survivor, who, it was argued, had eaten all his companions. The story became common in Paris, and afterward, when any marvelous recital was heard, the listener would shrug his shoulders and exclaim, *C'est un canard!* ("That's a *canard,* or duck!").

Canaries. See CANARY ISLANDS.

Canarium, kăn-ā'rĭ-um, a genus of plants of the order *Amyridaceæ.* The gum of *C. commune* has the same properties as balsam of copaiva. The nuts are eaten in the Moluccas and Java, but are apt to bring on diarrhœa. An oil is expressed from them, used at table when fresh and burned in lamps when stale.

Canary, a small, domesticated finch (*Carduelis canaria*), closely allied to the goldfinch (q.v.), and found throughout the Canary Islands, Cape Verde, and Madeira. Domestication, besides having modified the size and colors of this bird, has developed its power of song. It was introduced into Europe as a cage-bird early in the 16th century, and is now familiar in all parts of the world. Canaries in their wild state are about five inches long, and, like other finches, live mainly upon seeds, seldom eating insects. They build nests of moss and feathers in bushes and trees, often near dwellings; and their pale-blue eggs number four or five. Canaries are bought, bred, and sold in large numbers in England, Scotland, Belgium, and in the Hartz

Mountains, where their breeding forms an important household industry. The varieties are named, to a great extent, from the localities in which they are bred. Among birds valued for their beauty rather than for their power of song are: the British crested Norwich canary, the Manchester canary, which is noted for its abnormal size, it sometimes reaching a length of eight inches. The Scotch Fancy is a slender bird with long neck, its body, trunk, and tail, when in certain positions, curving into almost a half circle. The gold- and silver-spangled canaries are considered the handsomest. Their ground color is dull, spotted with gold or silver markings. The Belgian or humpback canaries are also bred for their beauty of plumage, and are remarkable by reason of the peculiar appearance they present by their broad shoulders, short neck, and small head.

Canaries bred for their power of song, and selling from $1 to $75, are those of the Hartz Mountains, which vary in color from a clear yellow to a bright green. The most valuable of all varieties is the South Andreasberg bird, bred solely for their power of song. Single birds are frequently utilized for the instruction of young birds, and are known as "campaninis." Other varieties are the cinnamon canaries and the cayernus, the brilliant red and scarlet of the latter being due to judicious feeding with red pepper.

Canaries are easily cared for, the only essentials being cleanliness, food, and water. The principal danger to the bird is a cold draught. The best food consists of canary-grass seed, hemp-seed, and a certain amount of greens. Acids are to be avoided, but sugar is beneficial in small quantities. Lime is essential to its welfare, and is most easily obtained in cuttle-fish bone. If their nails grow so long as to be troublesome to the bird, they should be occasionally cut with a very sharp scissors, thus running no chance of injuring the foot. Consult: Wallace, 'The Canary Book'; Belts, 'The Pleasureable Art of Breeding Pet Canaries.'

Canary-flower, an annual climbing plant (*Tropæolum peregrinum*), of the Indian cress family, a native of New Granada, cultivated for its showy yellow flowers.

Canary-grass. See CANARY-SEED.

Cana'ry Islands, or **Canaries,** a cluster of islands in the Atlantic, considered as belonging to Africa, the most easterly being about 150 miles from Cape Non. They are 13 in number, 7 of which are of considerable size, namely Palma, Ferro, or Hierro, Gomera, Teneriffe, Grand Canary (Gran Canaria), Fuerteventura, and Lanzarote. The other six are little more than mere rocks. The population in 1897 was 334,521, the area being about 2,808 square miles. The Canaries form a Spanish province. Lanzarote and Fuerteventura lie in the northeast of the group, Ferro is the farthest southwest. Through Ferro the first meridian used to be drawn. All are rugged and mountainous, frequently presenting deep ravines and precipitous cliffs to the sea, though having also fertile valleys and verdant slopes. The principal peaks are that of Teneriffe, 12,182 feet, and La Cruz, in Palma, 7,730 feet. Fuerteventura and Lanzarote, which are nearest the African coast, are less elevated and also less fertile than the others, and have much of an African character. Evidence of volcanic action is almost everywhere present, and volcanic disturbances have taken place on some of the islands in quite modern times. The flora generally resemble that of the Mediterranean region, the trees and shrubs including the oak, chestnut, pine, cedar, laurel, heather, etc.; but there are also plants that belong to the African region, such as the dragon-tree and euphorbias. Among the fauna may be mentioned the canary, the red partridge, and several kinds of lizards; there are no snakes. The goat is the chief domestic animal. The islands are somewhat deficient in moisture and severe droughts sometimes occur; tornadoes also are not infrequent. The climate is hot on the low grounds, temperate higher up, and generally healthy. The soil where suited for cultivation readily produces all kinds of grain, fruits, and vegetables in abundance; so that the name of "Fortunate Islands," which the ancients gave the Canaries, was well deserved. Some of the islands furnish good wine, especially Teneriffe and Palma. The Canaries constitute a valuable possession of Spain, and they serve as a winter resort for invalids from colder regions. This has led to the erection of hotels specially intended for visitors, to the making or improvement of roads, and to the providing of attractions of various kinds, including golf-courses, lawn-tennis grounds, etc. There are several places of worship for English-speaking visitors. The exports at present consist chiefly of bananas, tomatoes, and potatoes, shipped in great quantities to London and Liverpool, cochineal, sugar, wine, etc. The imports chiefly consist of textiles and other manufactured goods, cereals, coals, etc. Peaches, oranges, lemons, figs, and other fruits are cultivated. Teneriffe and Grand Canary are the two chief islands. Santa Cruz, the capital of the islands (pop. about 20,000), is a port on the northeast coast of the former, which also contains La Laguna, the old capital, Orotava, and other towns or villages. Orotava is a favorite resort of foreign visitors. Las Palmas, on the northeast coast of Grand Canary, is a more important place, with its new harbor, Puerto de la Luz, between three and four miles distant, protected by a breakwater. The city is rapidly extending, its streets have been improved and lighted by electricity. Numerous steamers engaged in the trade between Europe and Africa call here, and also at Santa Cruz. Though the Canaries were known to the ancients they fell out of the knowledge of Europeans till they again became known from the 12th or 13th century onward. They were claimed by the Spaniards in the 14th century, and in 1402–5 Jean de Bethencourt, a Norman adventurer, conquered Lanzarote, Fuerteventura, Gomera, and Ferro. By the end of the 15th century the Spaniards had subdued the original inhabitants entirely; and they almost extirpated them at a later period. These early inhabitants, who are known as Guanches, had attained some progress in civilization, as shown by remains still extant. They were no doubt of Berber stock. The present inhabitants are mainly of Spanish blood, though it is said the Guanche element may still be detected. See the separate articles on Teneriffe, Grand Canary, Palma, Ferro, and Lanzarote.

Canary-seed, the seed of a plant (*Phalaris canariensis*), belonging to the order of *Graminaceæ,* cultivated for its seed, which is used

principally as food for birds. In its early growth it is scarcely distinguishable from oats or wheat. With good cultivation it attains a height of three or four feet, and terminates in egg-shaped heads or ears, each containing upward of 100 seeds. The straw is of little value, either as fodder or 'itter, but the ears, especially when mixed with other kinds of chaff, are good food for horses. It requires a deep adhesive soil, and its produce per acre is about the same in quantity as wheat. It is a native of the Canary Islands, but is successfully cultivated elsewhere.

Canary Wine, a wine that comes from the Canary Islands, chiefly from the island of Teneriffe. It is not unlike Madeira.

Canary-wood, the light orange-colored wood of *Persea indica* and *P. canariensis,* trees of the laurel family.

Canas'ter, or **Kanaster,** originally, the rush-basket in which South American tobacco was packed and exported, and hence applied to a kind of tobacco consisting of the leaves coarsely broken for smoking.

Canastota, N. Y., village in Madison County, on the Erie Canal, and on the New York C., the West Shore and the Lehigh Valley R.R.'s. It is the centre of an agricultural district and manufactures agricultural implements, gasoline engines, boats, canned goods, etc. It has two banks, public library, churches, high school and two grammar schools. Pop. (1900) 3,330.

Can'by, Edward Richard Sprigg, American army officer: b. Kentucky, 1817; d. 11 April 1873. He graduated at West Point in 1839; served in the Mexican war, 1846–8; commanded the United States troops in New York during the draft riots of 1863; succeeded Gen. Banks in the command of the army in Louisiana, 1864; became brigadier-general United States army, and major-general of volunteers, 1866. After the war special duties were assigned to him, and in 1869 he took command of the department of the Columbia. He was treacherously shot by an Indian chief, while negotiating for the removal of the Modocs from northern California, in the "Lava Beds."

Canby, William Marriott, American botanist: b. Philadelphia, Pa., 1831. He was educated privately, and though a business man, has devoted much time to the study of botany. He gathered a fine herbarium of over 30,000 species of plants, which is now owned by the New York College of Pharmacy. A smaller collection was brought together for the Delaware Society of Natural History. He was one of the botanists attached to the Northern Pacific Transcontinental Survey.

Can'can, a dance, something of the nature of a quadrille, but accompanied by violent leaps and indecorous contortions of the body. The earlier and usual meaning of the word in French is noise, racket, scandal; and is derived, oddly enough, from the Latin conjunction *quamquam,* "although,"—a great squabble having arisen in the French mediæval law schools as to the pronunciation of this word.

Cancella'ria, a genus of univalve *Testacea,* belonging to the family *Muricidæ,* and Swainson's sub-family *Scolyminæ,* in which the shell is turbinate, scabrous, and generally reticulated, the spire and aperture nearly equal, and the body ventricose. Tate in 1875 estimated the known recent species at 71, and the fossil ones at 60, the latter from the Upper Chalk till now.

Cancellation, a method of abbreviating certain arithmetical and algebraic operations. When the product of several numbers is to be divided by another such product, any factors common to both products may be left out, or "cancelled." If divisor and dividend do not appear *in extenso* as products, the process of cancellation may yet be applied if common factors exist and can be detected. The work is substantially the same as that of reducing fractions to their lowest terms.

Can'cer (Lat. *cancer,* "a crab"), **Carcinus,** kär'sĭ-nŭs (Gr. καρκίνος, "a crab"), or **Carcinoma,** kär-sĭ-no'ma (Gr. καρκίνωμα, "cancer"), a disease so called from its hideous appearance or on account of the enlarged veins which surround it and which the ancients compared to the claws of the crab. It is called malignant because its symptoms are so aggravated and destructive to human life.

The causes of cancer are more or less obscure, but persistent local irritation and injuries are the established causes in a large majority of the cases. Hereditary influence has usually been considered a very powerful factor in the production of the disease. The consensus of opinion is opposed to the theory that cancer is of parasitic origin. It always begins as a local disease and is essentially a new growth and composed of tissue unlike that in which it grows. It is a disease of adult life as a rule, though it is frequently found in the young. In a general way it is most likely to attack an organ that has passed through its active period of existence, as the breast or womb. The womb and stomach are the organs in which primary cancer is most frequently found, though the disease may make its appearance in any organ or tissue of the body. When the disease begins it grows rapidly; there is loss of flesh, the neighboring lymphatic glands are involved through the absorbent glands; the tissue is infiltrated; and the body is affected generally. There is more or less pain, and the tumor is composed of cells and fibrous tissue in varying amounts, with more or less white fluid.

There are several varieties of cancer:

Hard or *Scirrhous Cancer,* or *Carcinoma Fibrosum.*— This is the usual form seen in the female breast, on the testicle, tonsil, skin, bone, eye, rectum, or any tissue, and is more frequent in women than in men. The disease spreads, and soon takes possession of the neighboring structures by infiltrating them. In this way it becomes gradually less movable and finally fixed. No tissue is able to resist its influence, muscles, skin, fat, and bone becoming filled with cancerous deposits as the disease advances. When the glands become enlarged they may press upon nerves, causing pain, and upon veins, causing swelling. In many cases the skin over the cancer contains small hard tumors known as tubercles; these are always indicative of cancer. Sometimes the skin becomes swollen and of a brawny appearance, indicating the most rapid form of the disease. When it attacks the female breast there is generally some slight pain, and as it advances there is a depression over the growth. Soon the nipple retracts, and if let alone it will ulcerate or break down and

have an offensive discharge. This form of the disease destroys life in from three to five years.

Medullary, Encephaloid, or *Soft Cancer,* in which the cell elements predominate, has all the cancerous peculiarities. Medullary cancer is the form which sometimes appears as a congenital tumor, and which attacks young adults and children, and is the cancer of young life. It grows rapidly, and runs its course much sooner than the hard form. It is found most frequently about the periosteum, bones, eye, uterus, tonsil, testicle, and ovary. It is specially liable to occur about the cavities and bones of the head and face. This form of cancer is so soft that it often seems like a sac of fluid.

Epithelioma is a term applied to cancers of the skin, because the composition of the cancer is similar to the epithelial elements of the true skin. These tumors affect the skin and mucous membrane, and never originate in any other tissue. They are called local cancers by many. Epithelioma first appears as a wart or small ulcer about the lips or face. It is also found in the tongue. scrotum, throat, rectum, penis, and clitoris. It grows slowly and is not liable to return when removed.

Rodent ulcers are forms of epithelial cancer, with the exception that the cells are smaller and do not extend by the lymphatics or have any secondary deposits. They usually begin on the face as dry warts and spread very slowly. They attack healthy people as well as weak or sick ones, and appear after middle age.

Colloid or *Alveolar Cancer* is one in which the intercellular spaces are filled with a glairy fluid like glue or mucus. It is most frequently found in the wall of the intestines or rectum and may be seen about the angles of the jaw, or in ovary and breast.

Melanosis, or *Black Cancer,* is a tumor containing pigment originating from a natural tissue which contains pigment, such as a mole or the choroid of the eye. Such tumors frequently appear in groups; the coloring matter being distributed throughout the mass in varying degrees. The secondary deposits are also distinguished by the presence of pigment. It is of the soft variety and runs a rapid course.

Treatment of Cancer.— There is no subject, perhaps, in the medical and surgical world, to which so much thought has been given in the last half-century as the treatment of this most formidable and alarming disease. A few years ago, when animal therapy was introduced, many of the preparations were extensively used in the treatment of cancer, and many persons proclaimed that a new era in the management of this disease had dawned upon the world, and in a little while no one would think of such a thing as a surgical operation in a case of cancer. While it has done some good, the beneficial results have not been satisfactory up to this time. Radiotherapy and phototherapy have been introduced recently in the treatment of cancer, and there are many experiments going on at this time, and much good has been accomplished in the treatment of cancers of the skin; but as yet there are no definite conclusions drawn from the use of these two agents. Perhaps in superficial carcinoma, involving large areas, radiotherapy is preferable to all other methods of treatment. Small superficial circumscribed areas are amenable to treatment with X-rays. In many cases it is best to remove the growth with a knife, and then follow it with the X-ray treatment. Some of those using this method say it is preferable. There seems to be some danger, in the treatment of carcinoma, of causing an inflammation which might carry the cancer cells to normal or inflamed tissue surrounding the growth. Another condition to be feared is the very great danger of burning the healthy skin. The use of the X-rays as a curative agent in the treatment of cancer of the skin is, too, in its experimental stage, and the weight of evidence is not sufficient to warrant any fixed conclusions, either for or against it, other than to say the trend of the medical mind is in its favor. Destruction by the use of caustics is a time-honored method of treatment and will continue to be employed by many. The agent used for that purpose is the chloride of zinc. The most highly scientific and satisfactory treatment for all forms of cancer, if seen early, is removal by the use of the knife. All the glands involved should be removed at the same time, as well as the neighboring ones, whether they are affected or not. Early recognition and prompt treatment are the only ways in which this disease can be cured.

Cancer, in astronomy, the fourth sign in the zodiac, marked thus ♋. The sun enters this sign on or about the 21st of June. He is at his greatest northern declination on entering the sign, and the point which he reaches is called the summer solstice, because he appears for the moment to stop in his progress northward and then to turn south again. The sun is then 23½° north of the equator, and a small circle of the sphere parallel to the equator at 23½° distant from it is called the Tropic of Cancer. The sun leaves this sign about the 22d of July. The constellation Cancer is no longer in the sign of Cancer. At present it occupies the place of the sign Leo.

Cancer-root, or **Beech-drops,** a branched parasitic plant (*Epiphegus virginianus*), of the order *Orobanchaceæ,* with brownish scaly leaves, indigenous in America, growing almost exclusively on the exposed root of the beech tree. The whole plant is powerfully astringent, and the root of a brownish color, spongy, and of a very nauseous bitter taste. It has been applied more externally than internally to the cure of cancer. Other plants of the same order are also called cancer-root.

Cancrin, Georg, gā ōrg′ kän-krēn′, COUNT, Russian general, statesman, and financier: b. Hanau, Prussia, 8 Dec. 1774; d. Saint Petersburg, 22 Sept. 1845. He served with distinction against the French (1812–15); was minister of finance from 1823 to 1844; and wrote on military and economic subjects, his most noted work being 'Military Economy in Peace and War.'

Cancrum Oris, or **Noma,** gangrene of the cheek, due to bacterial infection and mostly occurring in sickly children, especially those with scarlet fever or measles. It begins as a red spot on the cheek or at the angle of the mouth, spreads rapidly, and soon eats away the whole cheek, even the bone. There is fever, and death usually results. As soon as the disease is recognized it should be freely cauterized and the parts kept bathed in antiseptic solutions.

Candace, kăn'dą-sē, a name apparently common to the warrior queens of Ethiopia (Upper Nubia), between the Nile and the Atbara, in the later period of the kingdom of Meröe. The most distinguished of them invaded Egypt 22 B.C., was defeated by the Romans and obliged to sue for peace, which she obtained with a remission of the tribute imposed on her by Petronius. One of her successors is mentioned in Acts viii. 27; her high treasurer was baptized by Philip the Deacon on the road to Gaza.

Candahar'. See KANDAHAR.

Candaules, kăn-dô'lēz, king of Lydia, who lost his throne and life through his besotted admiration of the beauty of the person of his queen, in 718 B.C.

Can'dee, Helen Churchill, American journalist: b. Brooklyn, N. Y., 1861. She is an editorial writer on the New York *Evening Mail,* and has published: 'Susan Truslow' (1900); 'How Women May Earn a Living' (1900); 'Not on the Flag' (1901); 'An Oklahoma Romance' (1902).

Candeille, Amelie Julie, ăm-ā-lē zhü-lē kăń-dā-yē, French actress and composer: b. Paris, 31 July 1767; d. there, 4 Feb. 1834. She wrote libretto and music of the very successful operetta, 'The Beautiful Farmer.'

Candeish'. See KHANDESH.

Candela'brum, a word originally signifying candlestick, but usually denoting a support for a lamp or lamps among the Romans. The candelabra were of considerable size and often intended to stand upon the ground. They were made of wood, bronze, silver, or marble, and were often elaborately and beautifully adorned. Sometimes they had shafts in the shape of columns, which could be shortened or drawn out; sometimes the luxuriant acanthus formed a part of them; sometimes they represented trunks of trees entwined with ivy and flowers, and terminated by vases or bell-flowers at the top, for the reception of the lamps; and not infrequently the lamps were supported by figures. In ancient times Tarentum and Ægina were famous for their elegant candelabra, and Corinth also manufactured them. The Etruscan candelabra of bronze were celebrated.

Can'dia, or **Megalokastron,** Crete, a fortified seaport and capital of the island, situated on the north coast, 65 miles east of Canea. Its harbor admits only vessels of small draught. The governor and the Greek archbishop reside here. Soap is manufactured and exported. The fortifications of the city date from the time of the Venetian occupation, and in 1669, after a prolonged siege, it submitted to the Turks. Pop. estimated at 20,000.

Candia. See CRETE.

Can'didate, an applicant for an office, from the Latin *candidatus,* "white-robed," because, among the Romans, a man who solicited a public office appeared in a white garment — *toga candida* — and wore this during his candidature, which lasted for two years. In the first year the candidates delivered speeches to the people, or had them delivered by others. After this year they requested the magistrate to enter their names on the list of candidates for the office sought for. Before this was done the previous life of the candidate was subjected to a scrutiny in the senate, after the prætor or consul had received his name. If the senate accepted him he was permitted to offer himself on the day of election as a candidate. The formula by which permission was granted was "*Rationem habebo, renuntiabo*"; if he was not accepted he received the answer, "*Rationem non habebo; non renuntiabo.*" The tribunes often opposed a candidate who had been accepted by the senate. The morals of the aspirants, in the purer ages of the republic, were always severely examined. In the later period of the republic, nobody could obtain an office if he was not present and if he had not offered himself on three market days. On these days the candidates tried to insinuate themselves into the favor of the people. They went from house to house (*ambitio,* whence the word ambition), shook hands with everybody whom they met (*prensatio*), addressed each one by his name, for which purpose they generally had a nomenclator with them, who whispered the names of those whom they met into their ear. Cicero, therefore, calls the candidates *natio officiosissima.* They placed themselves on market days in elevated places in order to be seen. On the day of election they did the same. Favorites of the people accompanied them (*deductores*); some of their suite (*divisores*) distributed money among the people, which, though prohibited, was done publicly. *Interpretes* were employed to bargain with the people, and the money was deposited in the hands of *sequestres.* Sometimes a number of candidates united into parties (*coitiones*), in order to defeat the endeavors of the others. At last the grounds on which each candidate rested his claims to the office were read, and the "tribes" delivered their votes. The successful candidate then sacrificed to the gods in the capitol. To oppose a candidate was called *ei refragari;* to support him, *suffragari,* or *suffragatores esse.* In the early Church newly baptized Christians were called candidates, on account of the white robes worn by them for a certain period after celebrating the rite. The word "candidate" is also used by Protestants to designate a theologian who, having finished his studies at a university, is waiting for an appointment in the Church.

Candide, ou l'Optimisme, a famous novel by Voltaire, forming an epoch in French literature. In this book he ridicules the system of optimism with his usual spirit, and attacks revelation with plausible but superficial arguments, aiming to controvert the celebrated maxim of Leibnitz, "All is for the best in the best of all possible worlds." Among the descriptions in this work, that of the carnival at Venice is notable.

Candle, a solid cylindrical rod composed of beeswax, tallow, paraffine, or some other fatty substance, with a wick running longitudinally through its centre, designed for slow combustion with illumination. The wick is generally composed of a few threads of cotton yarn lightly twisted or plaited; but formerly, in home-made candles, dried rushes (*Juncus effusus*) were employed for this purpose. The process of making rushlights is described at length by the Rev. Gilbert White in his well-known 'History of Selborne.'

Candles are mentioned in several places in the Bible, but no direct evidence is given as to

their form or of what they were made. There seems to be a distinction, however, between candles and lamps,—the latter specifically calling for oil, while the candle is spoken of as being lighted and placed on a candlestick.

Considerable modern improvements have been made in the manufacture of candles. One of the most important of these consists in not employing the whole of the fatty or oily substances, but in decomposing them, and then using only the stearine or stearic acid of the former, and the palmitine of the latter class of substances. The animal fats are combinations of glycerine and fatty acids, principally stearic and palmitic, both solids, and oleic acid, which is liquid. If the latter be in excess, the fat will be a liquid and constitute an oil; if, on the contrary, the solid acids predominate, we shall have a more or less concrete fat, such as the tallow of the ruminants and lard of the hog. Stearic acid now constitutes the principal raw material for the manufacture of candles. The chief chemical agents employed to obtain the stearine are caustic lime, which, setting free the glycerine, produces stearate, margarate, and oleate of lime, in the form of a solid soap; and dilute sulphuric acid, by which this solid soap, after being reduced to powder, is effectually freed of its lime. By means of a subsequent bleaching process cakes of a perfectly white color, free from impurities, and fit for the manufacture of candles, are obtained.

Candles are commonly made by dipping, molding, or rolling. The former is the older method, and consists in arranging in a frame a number of wicks of the proper length and thickness, and dipping them a number of times successively in a tank of melted tallow or other fatty composition, with intervals for the incipient forms to cool and harden. These dippings are repeated until the candles have assumed the requisite thickness and weight.

Molded candles, as their name implies, are formed in molds. These are generally made of pewter, or an alloy of 20 parts of tin and 10 of lead, though glass has also been introduced. They are hollow cylinders of the length of the candle, and open at both ends, but provided at the upper end with a conical cap, in which there is a hole for the wick. A number of these molds are inserted in a wooden frame or trough with their heads downward; the wick is then drawn in through the top hole by means of a wire, and kept stretched and in the centre by a peculiar arrangement. The molds thus prepared are filled by running melted tallow of the proper temperature from a boiler into the trough. The candles remain in the molds for about 24 hours, but, as they improve by keeping, generally remain in the storehouse for a few months before they are exposed for sale.

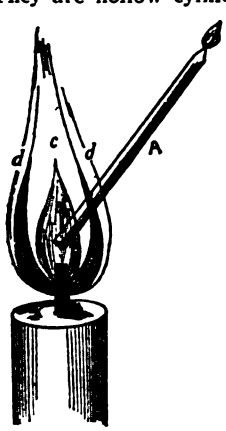

FIG. 1.—The parts of a candle flame.
a, Cold part, whence combustible gases may be extracted by means of a tube, *A*; *b*, blue part, having a higher temperature; *c*, luminous part.

The rolling of candles is confined principally to those made of wax. Although the bleaching of wax was described by Pliny, the use of this material for the manufacture of candles dates back only to the beginning of the 4th century. From its tenacity, and the contraction which it undergoes in cooling, wax cannot be formed into candles by melting it and then running it into molds. Instead, wicks, properly cut and twisted, are suspended by a ring over a basin of liquid wax, which is poured on the tops of the wicks, and, gradually adhering, covers them. Or the wicks may be immersed, as in the case of tallow "dips." When a sufficient thickness is obtained, the candles, while hot, are placed on a smooth table kept constantly wet, and rolled upon it by means of a flat piece of wood. In this way they assume a perfectly cylindrical form. Machines have been constructed, however, for the manufacture of such products. The large wax candles used in Roman Catholic churches are merely plates of wax bent round a wick and then rolled.

For preparing wax tapers, the wick is wound around a drum and is then made to pass into the melted wax under a hook placed at the bottom of the kettle. The wick, coated with wax, traverses a draw-plate which gives it the desired diameter, and then winds around a second drum. A little tallow, resin, and turpentine is often added to the wax in order to give it greater ductility.

Wax matches, also, which are generally of paraffine, are made with the draw-plate. They are afterward cut to the proper length and tipped with a paste of inflammable material. The use of wax for candles, by reason of their cost, was never very widely diffused, and of course at the present day is likely to diminish greatly. See WAX.

Hollow candles are provided with three apertures extending throughout their entire length. They offer the advantage of not guttering when burning. They are manufactured by means of a special machine, the molds of which contain three solid rods, which are withdrawn before the solidification of the mass.

At the beginning of the 18th century, spermaceti, a product of the cachalot, or sperm whale, came largely into use for the manufacture of candles. The competition of other materials and the decline of the whale fisheries limit its use at the present day.

Cetin, a form of spermaceti, is too brittle and lamellar in texture to use alone in candle-making. These defects are corrected by the addition of about three per cent of wax.

Paraffine candles came into general use about 1850. When crude petroleum is distilled the products obtained consist of light oils employed for illuminating purposes, and heavy oils used as lubricants. These latter, upon cooling, yield a solid substance of waxy consistence and deep color, called paraffine. This material, when purified, gives a white, odorless combustible substance, which is made into candles which give a brilliant but slightly smoky flame. Objections to their use are that at the moment of extinction they emit a disagreeable odor, and that they are too fusible and apt to become distorted in a warm atmosphere. For these reasons paraffine is generally mixed with stearic

acid. The use of paraffine candles is most common in Great Britain. See PARAFFINE.

Ozokerit, or *cérésine*, which is also used in the manufacture of candles, resembles paraffine in appearance. It is obtained by purifying a sort of natural mineral wax, the principal deposit of which is found in Galicia. It is not much used except in Germany and Austria. Since cérésine candles melt at a higher temperature than paraffine, they undergo no deformation when used.

Palm-oil is obtained from the west coast of Africa, especially the neighborhood of Lagos. The palm which yields it is the *Elais guineensis*, which produces a golden-yellow fruit of the size and shape of a pigeon's egg. By detaching its pulp from the kernel, bruising it into a paste, and then agitating it in boiling water, the oil is separated, and, rising to the surface, concretes as the water cools. About two thirds of it in weight consists of a peculiar white solid fat, called palmitine; the remainder is chiefly oleine.

The manufacture of candle-wicks is fully as important as the treatment of the combustible fats, and candle-makers have studied the principles of combustion with a view to discovering methods of producing the clearest light with the minimum of smoke, odor, and trouble in snuffing.

A flame is the result of the combustion of a gas. In a burning candle the fatty or other substances are melted and carried by the wick into the interior of the flame, where they are continuously converted into gas. We may compare the combustion of a candle to a microscopic gas-works, and, just as the gas-burner gives more or less light according as the pressure is varied, or the tip is more or less foul, or the proportion of air that reaches the gas is greater or less, just so a candle will give a different light according to the draft of air or the size and nature of the wick. Too large a wick would absorb the melted material too rapidly, the flame would be unduly increased, and the feeding of it would be effected under unfavorable conditions. Too small a wick would produce the opposite effect; around the periphery of the candle there would form a rim, which, no longer receiving a sufficient quantity of heat, would remain in a solid state; the cavity that serves as a reservoir for the liquefied material would become too full; and the candle would gutter. So the section of the candle, the size of the wick, and the draft of air in the flame must be apportioned in such a way that there shall always be an equilibrium between the quantity of material melted and that decomposed by the flame. The purity of the air, too, must be taken into account, for, just as a man needs pure air in order to live in health, so a candle has need of the same in order to burn well. During an evening party it may be observed that the brilliancy of the candles diminishes in measure as the air becomes impoverished in oxygen and enriched with carbonic acid.

In the flame of a candle four parts may be distinguished. The dark nucleus, *a* (Fig. 1), is formed by the gas resulting from the gasification of the combustible bodies. This gas may be ignited at the point of a glass tube, *A*, introduced into the flame. Since the air directs itself especially toward the axis of the flame, the azure-blue part, *b*, presents a comparatively low temperature in the illuminating envelope, *c*. The oxygen but partially suffices for the combustion, while in the non-illuminating part, *d*, products of the incomplete oxidation burn in the air in excess.

The wick must be placed in the centre of the candle, or else it will remain too long, produce smoke, and darken the flame. If the end remains exactly in the centre the air will not reach it, and the wick will carbonize and form a "thief" or "waster," which, falling into the cavity at the top of the candle, will make the latter gutter, and end by obstructing the wick.

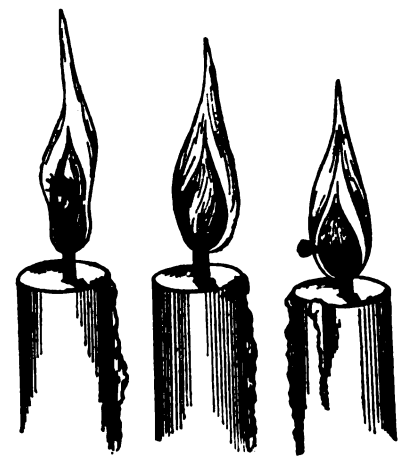

FIG. 2. FIG. 3. FIG. 4.

FIG. 2.—Tallow candle before snuffing. The wick becomes incrusted, and the flame becomes unsteady and smoky.

FIG. 3.—Tallow candle after snuffing. The flame is normal.

FIG. 4.—Wax candle. The wick curves, and a bead forms on its end inside the flame.

It then becomes necessary to snuff it. In order to do away with this inconvenience, Gay-Lussac and Chevreul, in 1825, recommended the use of flat or cylindrical wicks of an uneven texture, having the property of curving over. In the same year Cambacérès proposed the use of hollow plaited wicks, which, in measure as the candle burned, had the property of curving toward the white part of the flame. But ashes nevertheless formed, and, obstructing the wick, affected the light. In the month of June 1826 De Milly finally succeeded in solving the problem by impregnating the wick with boric acid. This latter, uniting with the ashes of the wick, gives rise to a fusible body, which is rejected in the form of a drop or bead toward the extremity of the wick. In Austria, wicks are impregnated with phosphate of ammonia, which gives analogous results. Balley has proposed a solution of sal-ammoniac of 2° or 3° Baumé.

Candle, Electric. See ELECTRIC LIGHTING.

Candle-fish, Oolakan, oo'la kăn, **Oulachon,** -kŏn, or **Eulachon,** ū'la-kŏn, a sea-fish (*Thaleichthys pacificus*), of the salmon family, frequenting the northwestern shores of America, of about the size of the smelt, to which it is allied. It is converted by the Indians into a candle simply by passing the pith of a rush or a strip of the bark of the cypress-tree through it as a

wick, when its extreme oiliness keeps the wick blazing. Oulachon oil, a substitute for cod-liver oil, is obtained from it. This fish is a favorite article of food in British Columbia.

Candle-fly, or **Lantern-fly,** a hemipterous insect of the group *Homoptera,* family *Fulgoridæ.* The large Chinese candle-fly (*Fulgora candelaria*) is remarkable for its greatly prolonged head, which was formerly believed to be luminous. Compare LANTERN-FLY.

Candle-nut, the nut of *Aleurites triloba,* the candleberry-tree, a native of the Moluccas, Pacific islands, etc., belonging to the natural order *Euphorbiaceæ.* It is about the size of a walnut, and yields an oil used for food and for lamps, while the oily kernels are also strung together and lighted as torches.

Candleberry, Bayberry, Candleberry Myrtle, Tallow-tree, or **Wax Myrtle,** a shrub (*Myrica cerifera*) common in North America, where candles are made from the waxy substance collected from a decoction of the fruit or berry. It grows abundantly in a wet soil, and seems to thrive particularly well in the neighborhood of the sea, nor does it ever seem to be found far inland. The berries intended for making candles are gathered late in autumn, and are thrown into a pot of boiling water, where the fatty or waxy substance floats on the top and is skimmed off. When congealed this substance is of a dirty-green color, somewhat intermediate in its nature between wax and tallow. After being again melted and refined it assumes a transparent green hue. Mixed with a proportion of tallow it forms candles, which burn better and slower than common tallow ones, and do not run so much in hot weather. They have also very little smoke and emit a rather agreeable odor. Soap and sealing-wax are also made of this substance. The plant has been cultivated in France and Germany, where it grows in the open air. Another plant belonging to the same genus is the sweet-gale (*Myrica gale*), which grows abundantly in bogs and marshes in Scotland. It is a small shrub with leaves somewhat like the myrtle or willow, of a fragrant odor and bitter taste, and yielding an essential oil by distillation. It was formerly used in the north of Europe instead of hops, and in some places it is still so used. The catkins or cones boiled in water throw up a scum resembling beeswax, which, collected in sufficient quantities, would make candles. The plant is used to tan calf-skins. Gathered in the autumn, it dyes wool a yellow color, and is thus used both in Sweden and in Wales. The dried leaves are used to scent linen and other clothes. Horses and goats eat the plant, while sheep and cows refuse it.

Can'dlemas, an ecclesiastical festival instituted by Pope Gelasius I. in 492, in commemoration of the presentation of Christ in the temple, and of the purification of the Virgin Mary. It is celebrated on 2 February, and has its name from the fact that in the Roman Catholic Church candles are blessed and carried in procession, in allusion to the words of Simeon, spoken of the infant Christ, "a light to lighten the Gentiles." See PURIFICATION.

Can'dler, Warren A., American clergyman: b. Carroll County, Ga., 23 Aug. 1857. He was graduated at Emory College in 1875, and was ordained to the Methodist ministry. He was pastor of various churches, and in 1888 was elected a bishop. He has been president of Emory College since 1888. He has written: 'History of Sunday Schools' (1880); 'Christus Auctor' (1899); etc.

Cand'lish, Robert Smith, Scottish clergyman: b. Edinburgh, 23 March 1806; d. Edinburgh, 19 Oct. 1873. He was educated at Glasgow University; in 1828 was licensed as a preacher, and in 1834 was transferred from Bonhill to St. George's, Edinburgh. In 1839 he threw himself into the conflict with the civil courts in the matter of the congregational right of election and independent church jurisdiction in matters spiritual, and soon became, next to Chalmers, the most prominent leader of the "non-intrusion" party and of the movement that culminated in the Disruption of 1843, and the formation of the Free Church of Scotland. From the death of Chalmers till his own death, Candlish was the ruling spirit in the Free Church. In 1862 he was made principal of the New College (the theological college of the Free Church), Edinburgh. He was the author of 'Contributions Toward the Exposition of the Book of Genesis' (1842); 'Reason and Revelation' (1859); 'The Fatherhood of God'; 'The Two Great Commandments' (1860); etc. See 'Life,' by Wilson (1880).

Candolle, Alphonse Louis Pierre Pyramus de, ăl-fôńs loo-ē pē-ār pē-rā-mü dė kăń-dōl, Swiss botanist: b. Paris, 28 Oct. 1806; d. 4 April 1893. He was son of Augustin de Candolle (q.v.). He was professor of botany and director of the Botanical Garden at Geneva, published numerous works on botanical subjects, and continued his father's 'Introduction to a Natural System of the Vegetable Kingdom.'

Candolle, Augustin (ō-güst-ăń) **Pyramus de,** Swiss botanist: b. Geneva, 4 Feb. 1778; d. there, 9 Sept. 1841. He studied at Paris, where he made his reputation by his 'History of Succulent Plants,' and 'Essay on the Medicinal Properties of Plants.' In 1808 he took the chair of botany at Montpellier, where he replaced the artificial method of Linnæus by the natural method of Jussieu, and published the remarkable 'Elementary Theory of Botany.' After the Restoration of 1815, he returned to Geneva, where he devoted the rest of his life to his great work, 'Introduction to a Natural System of the Vegetable Kingdom,' the continuation of which he entrusted to his son, together with an herbarium of 70,000 species of plants.

Candon, kăn-dōn', Philippines, a town of the province of Ilocos Sur, situated in the northwestern part of the Island of Luzon, very near the coast. Pop. about 16,000.

Can'dour, Mrs., a character in Sheridan's 'School for Scandal,' who conceals her slanderous nature under a pretense of frankness and kindness. The name is often used to denote people of such disposition.

Candy, or **Kandy,** a measure of weight in the East Indies. In Madras the candy is equal to 493.7 pounds, in Bombay it is 560 pounds, and in Ceylon it is equal to 500 pounds. It is divided into from 20 to 22 maunds. In Bombay there is a unit of capacity called the candy equal to 8.2 imperial bushels, and elsewhere a dry-

measure candy is found varying from 15 to 30 bushels.

Can'dy. See CONFECTIONERY.

Candy Ceylon. See KANDY.

Candytuft, a genus of plants (*Iberis*), of the natural order *Cruciferæ,* flowering in dense corymbs, and distinguished by an emarginate pouch with keeled and winged valves. It is indigenous to the countries bordering on the Mediterranean, and several species, as *Iberis umbellata, Iberis odorata,* and others, are cultivated in gardens.

Cane, kān, or **Ken,** a river in Bundelcund, British India, a tributary of the Jumna River. It follows a northeast course and is about 250 miles long.

Cane-brake, a term applied to the extensive growths of the *Arundinaria macrosperma,* the most gigantic of the grasses, which occur in the southern portions of the United States, and are to be found covering vast extents of country in the alluvial bottoms of Central and South America. The plant is not unfamiliar in the temperate zones, as its stalks are much used for fishing-rods. Cane-brakes are indicative of rich land, as they are only to be found in perfection in the most inexhaustible soils, where, having obtained a foothold, by their more rapid growth they usurp the place of the timber. In the southern portions of the United States the plant often reaches the height of 15 and 18 feet, with a base of one to one and a half inches diameter. In more southern latitudes it is very much larger. It grows as straight as an arrow from the root, tapering off finally in a beautiful, thread-like, feathery top. The leaves commence at about two thirds of the height of the plant, and seem to be attached directly to the stalk, as the branches on which they grow, save the very top ones, are not perceptible to ordinary observation. To the hunter, progress through a cane-brake is one of the most toilsome journeys that can be undertaken. Each step is disputed by the dense vegetation which rises before the intruder like a wall. In places, the cane is sometimes pressed down and interlaced, and then it becomes quite impenetrable. Under the most favorable circumstances the knife has to be freely used. Cane-brakes are often many miles in extent, always lessening in density as they reach high ground. They are favorite haunts for all kinds of game, which seek their solitudes either for protection or for the leaves for food. The deer and bear are particularly fond of the young green leaves, and upon them often become exceedingly fat. Cane-stalks being hollow, having no pith, and being divided inside every few inches into sections, they are very combustible when dried in the sun; and the air confined within the hollow sections, warming by the external heat, explodes with very considerable force, so that a cane-brake on fire gives the idea of a continued roar of distant musketry.

Cane Ridge Revival. See REVIVALS, AMERICAN.

Cane Sugar. See SUGAR AND SUGAR-MAKING.

Canea, kä-nē'a (Greek KHANIA), Crete, the chief commercial town of the island, situated on the northwest coast, with a good harbor. It occupies the site of the ancient Cydonia, but the present town is due to the Venetians, from whom it was wrested by the Turks, after a two years' siege in 1669. Canea is the principal mart for exporting the productions of the island. Pop. about 20,000. See CRETE.

Canella, a genus of plants belonging to the order *Guttiferæ,* but of which the affinities are so doubtful that it has been made the type of a distinct order, *Canellaceæ.* They are ornamental shrubs or trees. *C. alba,* the wild cinnamon, is a common West Indian aromatic evergreen tree, growing to a height of from 10 to 50 feet, with a straight stem branched only at the top. It is covered with a whitish bark, by which it is easily distinguished at a distance from other trees; the leaves are placed upon short foot-stalks and stand alternately. They are oblong, obtuse, entire, of a dark, shining green hue, and thick like those of the laurel. The flowers are small, seldom opening, of a violet color, and grow in clusters at the tops of the branches on divided foot-stalks. The fruit is an oblong berry containing four kidney-shaped seeds of equal size. The whole tree is very aromatic, and when in blossom perfumes the whole neighborhood. The berries, when ripe, are greedily eaten by the wild pigeons of Jamaica, and impart a peculiar flavor to their flesh. The canella of commerce is the bark of the tree freed from its outward covering and dried in the shade. It is brought to Europe in long quills, which are about three fourths of an inch in diameter, somewhat thicker than cinnamon, and both externally and internally of a whitish or light-brown hue, with a tinge of yellow. This bark is moderately warm to the taste, and aromatic and bitterish. Its smell is agreeable, and resembles that of cloves. In distillation with water it yields an essential oil of a dark-yellowish color, and of a thick tenacious consistence, with difficulty separable from the aqueous fluid. The remaining decoction, when evaporated, leaves a very bitter extract composed of resinous and gummy matter imperfectly mixed. It has been supposed to possess a considerable share of active medicinal powers, and was formerly employed as a cure in scurvy. Now it is merely esteemed as a pleasing and aromatic bitter, and as a useful adjunct in correcting more active though nauseous medicines. The powder is given along with aloes as a stimulating purgative.

Caneph'orus, a term applied to one of the bearers of the baskets containing the implements of sacrifice in the processions of the Dionysia, Panathenæa, and other ancient Grecian festivals. It was an office of honor, much coveted by the virgins of antiquity. The term is often applied to architectural figures bearing baskets on their heads, and is sometimes improperly confounded with caryatides.

Canes Venatici, kā'nēz vē-nāt'ĭsī ("the hunting dogs"), one of the northern constellations added by Hevelius in 1690, between Boötes and Ursa Major. Coming in after the time of Bayer, it has none of his assigned letters: but Baily, in the "B. A. C." in 1845, assigned the letters *a* and *b* to the two brightest stars, and they will probably stand, though they have not been universally accepted by astronomers. The former of the two stars is a well-known double. On the maps, the two dogs, Asterion and Chara, are represented as held in leash by Boötes, and

pursuing Ursa Major and the celestial pole, but this change in the figure of Boötes has of course been made since the introduction of Canes Venatici into the celestial train. The constellation is surrounded by Ursa Major, Boötes, and Coma Berenices.

Cañete, Manuel, mä'noo-el kän-yā'tā Spanish author: b. Seville, 6 Aug. 1822; d. 4 Nov. 1891. He was educated in Cadiz. For a long time he was an official in the ministry of the interior, and was later chamberlain to King Alfonso XII. His lyric poems, published under the title, 'Poesias,' are highly esteemed, and his dramas, also successful, include 'Un Rebate en Granada'; 'El Duque de Alba'; 'La Flor de Besalu'; and 'La Esperanza de la Patria' (with Tammayo). He is best known, however, as a dramatic critic and a writer on the history of the Spanish stage. His writings in the field of criticism had much influence in the reform of the stage, which at that time was badly corrupted. Among his other works are: 'Farsas y Eglosas de Lucas Fernandez' (1867); 'La Tragedia Llamada Josefina' (1870); 'Escritores Españoles é Hispano-Americanis' (1884); and 'Teatro Español del Siglo XVI.' (1884).

Canfield, James Hulme, American educator: b. Delaware, Ohio, 18 March 1847. He was graduated from Williams College in 1868; admitted to the Michigan bar, 1872, and practised law at St. Joseph, Mich., 1872–7. He was professor of history in the State University of Kansas, 1877–91; chancellor of the University of Nebraska, 1891–5; president of the Ohio State University, 1895–9, when he was appointed librarian of Columbia University, New York. He was secretary of the National Educational Association for five years, and its president for one. Besides numerous papers and addresses he has published: 'Taxation: Plain Talk for Plain People' (1883); 'The College Student and His Problems' (1902).

Cang, Cangue, or **Kia,** the wooden collar or portable pillory, weighing from 50 to 60 pounds, and fitting closely round the neck, imposed upon criminals in China. It renders the wearer unable to feed or otherwise care for himself.

Canga Arguelles, José, hō sā kän'ga ärgwĕl'yĕs, Spanish statesman: b. Asturias, 1770; d. 1843. In 1812 he was a member of the Cortes from Valencia, and rapidly rose to the leadership of the constitutional party; hence on the accession of Ferdinand VII. he was banished. Recalled in 1816, he became minister of finance in 1820, when the constitution was restored. Through the abolition of certain direct taxes, he caused financial disorder, and was forced to resign in 1821; was a member of the Cortes in 1822, but fled to England at the time of the revolution of 1823. Returning in 1829, he again was elected to the Cortes, where he remained true to his liberal principles. He wrote 'Memoria sobre el Credito Publico' (1820); 'Elementos de la Ciencia de Hacienda' (1825); and 'Diccionano de Hacienda' (1827–8).

Caniapuscaw, kăn-ĭ-ăp'ŭs-ka, a river in Labrador, outlet of a lake of the same name, flowing northwest into Hudson Strait; length, 400 miles.

Canicatti, kä-nē-kät'tē, Sicily, a city in the province of Girgenti, situated in a grain and fruit region. Here are also sulphur mines. The inhabitants are mostly engaged in agriculture. Pop. about 25,000.

Canic'ula, the Dog-star or Sirius (qq.v.); hence the term, "Canicular days," the dog-days (q.v.).

Cani'dæ, the dog tribe, comprising wolves, foxes, jackals, dogs, and the like, a family of carnivores, intermediate in structure and phylogeny between bears and hyenas. Their legs are long; the claws non-retractile, and in all except the lycaon there are five toes in front and four behind. The dentitions usually consist of three incisors, a great canine (a tooth which takes its name from its prominence in the dog, and is the seizing and tearing instrument); two small premolars, and two molars on each side of each jaw; but in the lower jaw there are three molars. All these teeth have the carnivorous characteristic of sharp-cutting crowns rather than broad, grinding surfaces, such as characterize the molar teeth of vegetable-eaters. Dogs are mainly diurnal and live in open uplands rather than in forests, where they obtain their prey by chasing it down; they occupy dens and burrows, and possess keen senses and great intelligence. See Dogs. For the fossil history of the family, see Carnivora.

Canid'ia, a Neapolitan woman whose real name was Gratidia, whom Horace loved, and who deserted him. Horace, in an ode, accused her of being a sorceress.

Canigou, kä-nē-goo', one of the peaks of the Pyrenees in France. It is in the department Pyrénées-Orientales, 24 miles from Perpignan; height, 9,137 feet.

Canina, Luigi, loo-ē'jē kä-nē'nä, Italian archæologist and architect: b. Casale, Piedmont, 23 Oct. 1795; d. Florence, 17 Oct. 1856. He was for some time professor of architecture at Turin, and afterward lived in Rome, where he published works of great value on the antiquities of Rome, Veii, Etruria, and Tusculum, among them 'Ancient Architecture Described and Illustrated by Monuments' (1844).

Caninde, kä-nēn'dā, a river of Brazil, flowing into the Parnahiba; length, 200 miles.

Ca'nis Major ("the greater dog"), a constellation of the southern hemisphere, remarkable as containing Sirius, the brightest star in the heavens.

Canis Minor ("the lesser dog"), a constellation in the northern hemisphere, immediately above Canis Major, the chief star in which is Procyon.

Canisius, Petrus, pā'trŭs kä-nĭsh'i-ŭs, Dutch theologian: b. Nimeguen, 8 May 1524; d. Freiburg, Switzerland, 21 Dec. 1597. He was the first man in Germany who entered the order of the Jesuits, of which he became a very active member. In 1549 he was made professor of theology, rector and vice-chancellor of the university at Ingolstadt, and in 1551 court preacher at Vienna. He afterward reformed the University of Vienna, according to the views of the order. His catechism, which has passed through more than 400 editions, is yet in use. He persuaded Ferdinand I. to adopt stringent measures

against the Protestants, and founded the colleges at Prague, Augsburg, Dillingen, and Freiburg in Switzerland. He was beatified 20 Nov. 1864.

Canisius College, an educational institution in Buffalo, N. Y.; organized in 1870 under the auspices of the Roman Catholic Church; reported in 1903: Professors and instructors, 31; students, 283; volumes in the library, 24,000; value of property (including endowment) $385,000.

Can'ities (Latin *Canus,* "hoary or gray-haired"), whiteness or grayness of the hair. When occurring in consequence of old age it is not a disease. Sometimes it happens suddenly, as a result of severe mental emotion.

Canitz, Friedrich Rudolf Ludwig, frēd'rĭH roo'dŏlf lood'vĭg kä nĭts (BARON), German poet and diplomat: b. Berlin, 27 Nov. 1654; d. there, 16 Aug. 1699. He studied law at Leyden and Leipsic, and was made state counselor in 1697 under Frederick I. of Prussia; in 1698 he was given the rank of baron. His poems were first published anonymously after his death (1700) under the title 'Nebenstunde unterschiedener Gedichte'; the second edition with the name of the author appeared in 1719. They had influence on style in opposition to the mannerisms of Lohenstein and other writers of the time. Those most popular with his contemporaries are the satires and an elegy on the death of his first wife.

Canker, a disease of plants. See APPLE.

Cankerworm, a caterpiller of a geometoid moth of the genus *Anistopteryx,* destructive to fruit-trees, especially apples. See APPLE.

Canlassi, Guido, gwē'dō kän-läs'sē, Italian painter: b. near Rimini, 1601; d. Vienna, 1681. He studied under Guido Reni at Bologna, and lived at Venice as court painter under the Emperor Leopold I., and later at Vienna. He is to some extent an imitator of Guido Reni, but is especially distinguished for his use of color. His chief works, mostly biblical or mythological subjects, are in Vienna, Munich, and Dresden.

Can'na, one of the Hebrides, 12 miles southwest of Skye, and 3 miles northwest of Rum. It is four and a half miles long, one mile broad, and four and a half square miles in area. The surface, nowhere higher than 800 feet, consists of trap. A hill here of basalt, called Compass Hill, reverses the magnetic needle.

Can'na, a genus of plants, some species of which have fine flowers, and some, from their black, hard, heavy seeds, are called Indian shot. There are about 30 species in tropical America, with ornamental leaves, creeping rootstocks, and panicles of red or yellow flowers. *C. indica* is the best-known species, and *C. edulis* yields *tous-les-mois.*

Can'nabis. See HEMP.

Cannæ, kăn'ē, Italy, an ancient town in Apulia, on the river Aufidus. Its site was between the modern Canosa and Barletta, famous for the great battle in which the Romans were defeated by Hannibal (216 B.C.). The Roman army under the consuls Æmilius Paulus and Terentius Varro consisted of 87,000 men, while that of the enemy amounted only to 50,000, among whom were 10,000 horse. The battle was brought on by Varro against the better judgment of his colleague. The Romans left their strong position at Canusium on the banks of the Aufidus, and the whole army crossed the river. Varro drew up his troops on the plain, with his right wing protected by the river. At the same time Hannibal forded the Aufidus and led his small army to the attack. The battle was long, and the Romans fell in great numbers, among them the consul, Æmilius Paulus, and both the proconsuls Servilius and Atilius. Hannibal's Numidian horse destroyed those who fled from the field. The victor made 13,000 prisoners. The Romans lost, according to their own lowest statements, 45,000 men; according to the highest, 70,000. Hannibal collected the gold rings of the knights who had fallen and sent some pecks thereof to Carthage.

Can'nel Coal. See COAL.

Cannes, kän, France, a seaport and health resort on the shore of the Mediterranean, in the department of Alpes-Maritimes. It is beautifully situated in a rich fruit district, has a mild and equable climate, and attracts numerous winter visitors. There are many hotels and fine villas, charming public walks, etc. Perfumes and soap are made here. Near Cannes, 1 March 1815, Napoleon landed on his escape from Elba. Pop. about 20,000.

Cannibalism, the act or practice of eating human flesh by mankind; anthropophagy; also the eating by an animal, or animals, of a member of the same race; as, of a wounded wolf by others of the pack. In the 'Odyssey' of Homer we have the story of Polyphemus devouring human flesh; and in Herodotus, the Massagetæ (i. 216) are said to eat their aged parents. The Padæi of India (Herodotus iii. 99) were in the habit of killing and eating their relations when they fell ill. Modern facts, the truth of which is put beyond all doubt, confirm the statements of Herodotus. Among the ancient Tupis of Brazil, when the *pajé* (chief) despaired of a sick man's recovery, he was by his advice put to death and devoured. Herodotus (iv. 26) also says that among the Issedones, when a man's father dies, his relations come and help to eat the dead man, whose flesh they render more palatable by mixing it with that of some animal.

In the Middle Ages these stories were wonderfully enlarged, and people who had not yet embraced Christianity were pretty generally set down as anthropophagi. When the Lombards invaded Italy at the end of the 6th century it was reported of them that they ate human flesh; and a century later the same aspersions were cast on the Slavonian tribes. It became the fashion to bandy the accusation between enemies: thus, during the Crusades, the Saracens said the Christians ate human flesh as well as the unclean flesh of swine; while the Christians on their side maintained that the Saracens ate men, women, and children, and were particularly fond of a sucking Christian babe torn fresh from the breast of its mother. The old travelers' narratives abound in stories of cannibalism, which we may almost invariably pronounce to be false. Few persons would now credit that the Indians and Chinese sold human flesh in the market, or that the Grand Khan of Tartary fattened his astronomers and magicians with the carcasses of condemned criminals; but the

statements of Marco Polo regarding the Battas, a people of Sumatra, have been confirmed.

When America was discovered, cannibalism was found to prevail to a very great extent, and as late as the year 1866 it is well known that two Brazilian officers exploring the Pachitea River were eaten by the natives. The practice was also common in Malaysia and Polynesia,— the case of Capt. Cook in the Sandwich Islands is well known. In many parts of Africa cannibalism is systematically practised; human flesh being regarded as a great delicacy, and even preferred to every other kind of food.

Cannibalism has been ascribed to various causes — to hunger, desire for revenge, and to various superstitions. Among the latter is the belief that the spirit of a brave enemy would pass into the body of the eater and thereby strengthen him for battle. More especially is this the case in regard to eating the heart. The former cannibals of the Sandwich and other Polynesian islands used to give to a human body destined to be eaten the equivocal term "long pig."

Cannibalism has been practised by members of civilized nations from time immemorial, when in dire distress from want of food. Travelers in desert lands and shipwrecked sailors have often resorted to this method of preserving the lives of many at the expense of the few, and perhaps as a general rule this has been done by mutual agreement to abide the hazard of a lottery to decide who should be the victim. Despite such agreement, the killing of a comrade in this manner is generally held to be murder and punishable accordingly. Several years ago, the survivors of the shipwreck of a British vessel resorted to this plan. They were subsequently rescued, and on their return to England were tried for murder, convicted, and sentenced to death. This sentence was afterward commuted to imprisonment, and later the prisoners were pardoned.

Canniff, William, Canadian physician: b. Thurlow, near Belleville, Ontario, 1830. He was educated at Victoria College, Cobourg, and studied medicine in Toronto, New York, and London, England, where he took the degree of M.R.C.S. He served in the Crimean war, 1856; returned to Canada, became professor of surgery in Victoria College; visited the Washington hospitals during the Civil War, and finally settled in the practice of his profession at Toronto. He was one of the originators of the "Canada First" movement. Besides many periodical articles, he has written 'Manual of the Principles of Surgery, Based on Pathology' (1866); 'The Medical Profession in Upper Canada, 1783–1850: An Historical Narrative' (1894); 'The Settlement of Upper Canada.'

Can'ning, Albert Stratford, English writer: b. 24 Aug. 1832. He is the second son of the first Baron Garvagh. He has been a prolific writer, and among his works may be mentioned 'Christian Toleration' (1874); 'Intolerance Among Christians' (1876); 'Religious Strife in British History' (1878); 'British Rule and Modern Politics' (1898); 'British Power and Thought' (1901).

Canning, Charles John (Earl), English statesman, son of George Canning (q.v.): b. near London, 14 Dec. 1812; d. London, 17 June 1862. He was educated at Eton and Oxford. He entered Parliament in 1836 as member for Warwick, and in the following year succeeded to the peerage, on his mother's death, as Viscount Canning. In 1841 he was appointed under-secretary of state for foreign affairs in Peel's government, and in 1846 commissioner of woods and forests. In the Aberdeen ministry of 1853, and under Palmerston in 1855, he held the postmaster-generalship, and in 1856 went out to India as governor-general. Throughout the mutiny he showed a fine coolness and clear-headedness, and though his carefully pondered decisions were sometimes lacking in promptness, yet his admirable moderation did much to re-establish the British empire in India. In 1858, when the government of India was transferred from the East India Company to the Crown, Canning became the first viceroy; and in the succeeding year he was raised to the rank of earl. From that time till his retirement in March 1862, the arduous task of undoing the mischief wrought by the mutiny devolved upon him, and his great success was a witness to his ability. See Cunningham, 'Earl Canning' (1891).

Canning, George, English orator and statesman: b. London, 11 April 1770; d. Chiswick, 8 Aug. 1827. His father offended his family by marrying a lady of beauty and accomplishments, but without fortune, and died in 1771, leaving her destitute. She however lived to see the success of her son, from whom she ever received the tenderest marks of filial love. Canning, who had inherited a small estate in Ireland, was educated at Eton. In 1787 he was entered at Oxford. His vacations were passed with Sheridan, by whom he was introduced to Burke, Fox, and other distinguished Whigs. But although Sheridan had already announced him in Parliament as the future ornament of his party, Canning entered into terms with Pitt, by whom he was brought into Parliament in 1793. During the first session he remained silent. In 1796 he was under-secretary of state. In 1797 he projected, with some friends, the 'Anti-Jacobin,' of which Gifford was appointed editor. Canning contributed many poetical and other articles to this periodical, the happiest of his efforts in this direction being the 'Needy Knife-grinder.' In 1798 he supported Wilberforce's motion for the abolition of the slave-trade. In July 1800 Canning increased his fortune and influence by a marriage with Joanna, daughter of Gen. Scott, a lady with a large fortune. The administration being dissolved in 1801, Canning became a member of the opposition until the restoration of Pitt in 1804. In 1807 he was appointed secretary of state for foreign affairs, in the Portland administration. A political misunderstanding with Lord Castlereagh led to a duel between that minister and Canning, in which the latter was slightly wounded. This dispute occasioned the dissolution of the ministry. In 1810 he opposed the reference of the Roman Catholic claims to the committee of the whole House, on the ground that no security or engagement had been offered by the Roman Catholics. Some of his most brilliant speeches were on this subject. The adoption of the measure being a matter of policy, the state of opinion, the condition of affairs, and the securities with which it should be accompanied, were with him elements of the question. He pro-

posed securities in 1813, which, with the bill, were rejected. He supported in 1812 and 1813 the same motion which he had opposed in 1810. To Canning was principally owing the first blow which shook the throne of Napoleon: the British policy in Spain was directed and animated by him. In 1812 he was elected member for Liverpool, from which he was also returned in 1814, 1818, 1820. In 1814 he was appointed minister to Portugal, and remained abroad about two years. In 1819 he declared his decided hostility to parliamentary reform in whatever shape. On the occasion of the proceedings relative to the queen, he declared that "toward the object of that investigation he felt an unaltered regard and affection"; and soon after resigned the presidency of the board of control, and went abroad. Having been nominated governor-general of India, he was on the point of embarking when the death of the Marquis of Londonderry called him to the cabinet as secretary for foreign affairs, 16 Sept. 1822. One of his earliest acts in this situation was to check the French influence in Spain, the French having sent an army into that country to put down the revolutionary party. By way of withdrawing the Spanish-American colonies from French influence he decided to recognize their independence; thus, as he afterward phrased it, "calling the New World into existence to redress the balance of the Old." He continued to support the propositions in favor of the Roman Catholics, and in 1825 communicated to foreign ministers the determination of the government to appoint *chargés d'affaires* to Colombia, Mexico, and Buenos Ayres. In consequence of the attempts made by Spain to assist the malcontents of Portugal, it was immediately determined by the ministry to support the regency of that country, and troops were sent to Lisbon in January 1827. On 12 April 1827 his appointment to be prime minister was announced. His administration was terminated by his death, but not until it had been crowned by the Treaty of London (6 July), for the settlement of the affairs of Greece. As an orator Canning was showy and graceful, with a brilliant wit and caustic satire, though neither formed on a very masculine taste. During his career the leading domestic subjects on which the British Parliament was called upon to legislate were the following: the liberty of the press, the emancipation of the Roman Catholics, the test and corporation acts, the corn-laws, and reform in Parliament. Those of a foreign nature were, among others, the various overtures of peace between Britain and France, the settlement of Europe on the overthrow of Napoleon, the treatment of Italy by the Austrians, the Spanish revolution, and recognition of the South American republics. On all these questions, with one or two exceptions, he supported the high Tory side. The chief exceptions were the emancipation of the Roman Catholics, and the recognition of the South American republics. He was also desirous of amending the corn-laws. Consult Stapleton, 'Political Life of Canning' (1831); Stapleton, 'Canning and His Times' (1835); Lord Dalling, 'Historical Characters' (1867).

Canning, Sir **Samuel,** English civil engineer: b. Wiltshire, 1823. He is best known in connection with the laying of the Atlantic cables in 1865–6 and 1869, and those in the Mediterranean and North Seas. He was knighted in 1866.

Canning, Stratford (Viscount Stratford de Redcliffe), English diplomatist, cousin of George Canning (q.v.): b. London, 4 Nov. 1786; d. 14 Aug. 1880. His father, Stratford Canning, who had been disinherited owing to an imprudent marriage, and had gone into business as a merchant, died a few months after his son's birth, and in consequence young Stratford and his mother removed to Wanstead. He went to Eton, and in 1805 he was elected to a scholarship at King's College, Cambridge. Before graduating he was in 1807 appointed by his great cousin, then foreign secretary, to be his précis writer, and in the latter part of that year was sent as second secretary with a mission to Denmark. In the following year he accompanied as first secretary an important mission to Constantinople, which resulted in the conclusion of a treaty of peace with the Porte on 5 Jan. 1809. In the summer of 1810 his chief, Sir Robert Adair, was transferred to Vienna, and Canning temporarily succeeded him as ambassador at Constantinople. Before the arrival of Adair's successor, Canning made his reputation as a diplomatist by the masterly way in which he conducted the difficult negotiations which led to the signing of the Treaty of Bucharest on 28 May 1812. This treaty put an end for the time to the war between Russia and Turkey, and thus left Russia free to resist the advance of Napoleon. Moreover, it firmly secured English predominance at Constantinople, and was in this respect the first notable triumph in the traditional British policy on the Eastern Question. In 1812 Canning returned to London, and after declining in 1813 the offer of the chief secretaryship to Lord Aberdeen's Vienna mission, accepted in the following year the post of envoy extraordinary and minister plenipotentiary in Switzerland. He held this post till 1818, and was completely successful in his endeavors to free Switzerland from French domination, and to erect it into a neutral federal republic. Shortly after his return he was appointed ambassador to the United States, and he arrived at Washington in the autumn of 1820. He was again in London in 1823. The diplomatic agreement arrived at in 1824 was however, thrown out by the United States Senate. After a brief but important mission to the Russian capital he was again sent to Constantinople in October 1825 as ambassador. In the following year he succeeded in again patching up a peace between Russia and Turkey, and thus prepared the way for a joint representation by England, France, and Russia on behalf of insurgent Greece. Negotiations were, however, abruptly broken off by the Sultan's indignation on learning of the battle of Navarino, and Canning was later in the same year engaged, along with the representatives of France and Russia, in drawing up proposals for establishing a Greek kingdom. These were ultimately forced on the acceptance of Turkey in a more stringent form as part of the peace treaty which ended the Russo-Turkish war of 1828–9. In 1829 he resigned his position and returned to England, where he was created G.C.B. He entered Parliament as member for Old Sarum, but he ultimately secured election for King's Lynn. After acting as special envoy to the Porte in 1831–2, and to Portu-

gal in 1832–3, he was in 1841 appointed for the third time ambassador at Constantinople. For a considerable period he was mainly engaged in assisting and encouraging the Sultan, Abd-el-Mejid, in his policy of reform, but after a visit to England in 1852, during which he was raised to the peerage, his efforts had to be directed to thwarting Russian designs. His diplomatic triumph over Prince Mentchikoff caused the czar in a moment of irritation to precipitate the Crimean war. He resigned in 1858, and the remainder of his career was passed mainly in retirement. In addition to a few volumes of poetry, he published works entitled 'Why am I a Christian?' (1873), and 'The Greatest of Miracles' (1876). A selection of his articles on eastern affairs was published in 1881 under the title of 'The Eastern Question.' See 'Life' by Stanley Lane-Poole (1888).

Canning Industry in America. The development in this country of the practical arts pertaining to the hermetical sealing of food, now so well known under the generic title of canning, is an interesting feature of the commercial growth of this country. Evolved from the studious and observant brain of an humble Frenchman, and tested through years of his plodding experience, the new method came amidst the throes of the French Revolution, in the year 1795, a veritable offspring of the First Republic. About 14 years later the French government, under Napoleon the Great, awarded the discoverer the prize of 12,000 francs, which long before had been offered for a method that would preserve alimentary substances without robbing them of their natural qualities and juices. Nicholas Appert, born in 1750, spent his life in brewing, wine-making, pickling, and the making of confectionery, living over 90 years, and continuing to the last to invest all funds he could obtain in the prosecution of his investigation in these different lines. He died, in 1841, neglected and alone. His children have received some benefit from his labors, the title of Chevalier being borne by a descendant of his to-day, indicating that the cross of the Legion of Honor had been awarded to him in recognition of his merits. This industry, which has now become essentially American, begins, therefore, exactly within the century. Appert had obtained financial assistance from English sources, and as a result we find that, about 1810, his method was being used in the factories of an English firm of purveyors.

In that year a patent was granted in England to one Peter Durand for a can, made of tin, to be used in hermetically sealing food, the patent also covering the use of glass, pottery, and other fit material. In the letters patent, it is stated that the new method was communicated to him by a foreigner residing abroad. Ezra Daggett, who was in the employment of this English firm, brought the secret, it is believed, to America between 1815 and 1818. In 1819, he was engaged in the packing of hermetically sealed food by this process in New York city, in company with his son-in-law, Thomas Kensett. The descendants of Mr. Kensett still have some cans of these goods in their possession which were put up in 1822, as the labels show. Salmon and lobster were among the earliest goods packed, and oysters also were preserved, according to these labels. In 1825, a patent was granted to Ezra Daggett and Thomas Kensett for an improvement in the art of preserving. The can was then called a "case," the label containing directions for opening it.

About the same time that Daggett came to America from England, Charles Mitchell arrived in Boston from Scotland. He was born in London, there learning the canning business as an apprentice. He left London in 1820, and on reaching Boston almost immediately entered the employment of William Underwood, who established the firm of William Underwood & Company, in 1822, to hermetically seal food. There is a lack of information concerning the development of the industry during the next 20 years, but it was throwing out roots from the New York and Boston plants. In 1843, the firm of Treat, Haliday & Company were canning lobsters in New Brunswick, and salmon in Maine. There is a supposition that Haliday brought the process from Scotland and joined Treat about 1840. Already there was a known distinction between the French (or Appert) process and the Scotch method. Appert used glass vessels only, but the Scotch method required the puncturing of the tin after the first cooking, and then recooking after the hole was soldered. About 1846, Wells, Miller & Provost had a packing-house in New York, on Front Street, near Peck Slip; W. R. Lewis & Bro. established a factory at Portland, Me.; and E. C. Wright began packing oysters in Baltimore, having obtained his knowledge of the process from Thomas Kensett the first. At this time cans were made by the regular tin-workers, but cappers were becoming a regular branch of the business.

Henry Evans, Jr., a tin worker by trade, learned the process while working as a capper for Wells, Miller & Provost. In 1848 he went to Eastport to pack lobsters for that firm; in 1851 going to Baltimore and later engaging with Thomas Kensett the second, who had formed a partnership with Ira Wheeler in New York. In 1849 Evans had a factory at Newark, N. J., for Kensett & Company, and here were packed supplies of fresh vegetables for Dr. Kane's Arctic Expedition. These included tomatoes, onions, potatoes, and cabbage. Some time after this Evans went to the West Indies, where he packed for Kensett & Company the first pineapples ever packed in that way in those islands.

About 1850 the business began to develop rapidly, and its history is difficult to follow. The oyster business of Baltimore and the lobster and sardine fisheries of Maine were the principal bases of extension. William Numsen & Sons began work in this business in Baltimore in 1847; in 1849 they were packing cove oysters. Tomatoes, peaches, pears, and other articles were put up about the same time, the process being applied to nearly all the fresh foods in the different canneries. A number of active New Englanders located in Baltimore, embarking in the raw-oyster shipping business, and in time many of them began hermetically sealing oysters. The widow of Thomas Kensett the first sold the secret to Holt & Maltby and others, and thus they got into the cove-oyster packing. This title of "cove oysters" has come to be recognized as the specific name for hermetically sealed cooked oysters. "Cove" oysters were from coves famous for the size and quality of their oysters, which were located on the west

side of Chesapeake Bay, above the Potomac. The canning business has given them immortality.

For the first half of the century the industry was obliged to produce all the supplies it needed by hand-labor, and even after canneries multiplied the output was necessarily restricted because of the number of hands required and the cost of the goods, based entirely on hand-labor. This industry is the connecting link between agriculture and manufactures, the can being an essential to the foods in this condition; and the food is the *raison d'être* of the can — useless each without the other. The manufacturing lines that have received an impulse from the introduction of this industry are those that unite in the production of the can, the cases, labels, and canning machinery.

Previous to 1850 the cans were made by hand, usually by cutting out the tin blanks with shears, beating the ends into shape with a mallet over a former of some kind, and cutting the opening with a hand-punch and mallet. Originally the opening was covered on the flat top by a flat circular piece of tin, well soldered down. The first can-making machinery we have any authentic record of was naturally adapted from such as tinsmiths used, they being the first providers of cans for the packers, but in 1849 Evans, at Newark, N. J., introduced the use of the "Pendulum" press for making can-tops. This same press came to Baltimore in 1851. With this press Evans introduced the crease and convex cap.

The California gold-fever gave a great impetus to the canning industry, and the list of the new firms that entered the business during the ten years from 1850 to 1860 would be too long to insert here, even if it could be made up with accuracy. Two historic firms arose just previous to the close of the first half of the century — Rumery & Burnham, of Portland, Me., and Louis McMurray, of Baltimore. The former was merged at the close of the war into the firm of Davis, Baxter & Company, a firm then well established. Later, this became the famous Portland Packing Company.

The Civil War gave another impulse to the industry, many of the established firms canning meat on government contracts. The canning of milk, under the title of condensed milk, resulted in a wide extension of the industry as previously carried on. Condensed milk, produced by evaporation and preserved with sugar, became a regular article of commerce; large quantities of it were used by the commissariat of the United States army. In 1860, the New York Condensed Milk Company of New York was in full operation, Mr. Borden being a stockholder of the company. In 1853, William Numsen & Sons of Baltimore were handling such large quantities in this same line that they formed the Baltimore Condensed Milk Company, in which Mr. Borden was also interested. On 4 Nov. 1856, a patent was issued to Gail Borden of New York for this method, and under the same date another for an improved method that dispensed with the boiling.

On 8 April 1862 a patent was issued to I. Winslow of Philadelphia for a new method of preserving green corn, which was the regular Appert process for hermetically sealing goods. Winslow assigned this to J. W. Jones, of Portland, Me. It is understood that Winslow learned this art in France, when on a visit there in 1840. Nathan Winslow, of Portland, Me., is said to have been the first who commercially canned sugar corn, and the Winslow Packing Company has ever since been famous for its canning of this vegetable. There is reason to believe that the industry was first carried into the Mississippi Valley by the same Henry Evans, Jr., who was in Baltimore with Thomas Kensett the second. Evans, who was at that time a member of the firm of Evans, Day & Company, was returning East in 1873, when he happened to stop over at Circleville, Ohio. There he met C. E. Sears, who was engaged in drying sugar-corn, such as is known as shaker corn. He found he could purchase cut corn, fresh and sweet, at a price per can far below the cost of the corn in the husk at Baltimore. His firm bought largely of it that season, besides fitting up a cannery at Circleville to can it there. The next year, however, the cannery was sold to Mr. Sears. This same factory, greatly extended by Mr. Sears, is now owned and operated by his widow, Mrs. C. E. Sears, so successfully that in 1894 she packed the largest output of sugar-corn of any factory in the West, if not in the world.

In the spring of 1864 the business of canning salmon was begun by the firm of Hapgood, Hume & Company, at Washington, Yolo County, Cal., on the Sacramento River. In two years, salmon became scarce there, and after an inspection tour the firm built a cannery at Eagle Cliff, on the Columbia River, Washington. This factory began operations in 1867. The development of the Pacific Northwest was due more to the salmon industry than to any other single influence.

In 1866 G. C. Van Camp, of Indianapolis, Ind., began packing all kinds of fruits and vegetables in six-gallon cans, the goods being sold in the city markets by the pint or quart. In 1868 he went into the regular canning business, mostly in No. 2 cans. G. W. Baker began the canning of sugar-corn in Aberdeen, Harford County, Md., in 1866, and several of his sons still continue in the business.

Between 1877 and 1885 canneries developed in great numbers, Harford County, Md., alone having over 400. At the same time firms spread through all the States of the West, mainly packing sugar-corn and tomatoes. There had been many efforts to introduce machinery into the packing-houses, but it was generally resisted by the employees, led by the cappers, on whom depended the proper sealing of the cans. This important function had been organized into a regular system, one boss capper taking the capping of an entire factory, and, in some places, of several factories. For the sake of having experienced cappers in season the firms would keep them employed in making cans during the winter months, so even the making of cans was largely governed by these employees. Machines to do capping had been invented, but proved to be unpractical until, about 1883, I. H. Cox, of Bridgeton, N. J., introduced a hand-capper which proved a success. Very soon thereafter machines for all kinds of operations in the business were introduced. As machinery multiplied, country canneries increased in number because it supplied the place of hands, which the rural sections lacked. By 1892 the variety of machinery special to this industry had increased to such an extent that in

that year, at an exhibition of canners' supplies held in the city of Chicago, in connection with a convention of the Western Packers' Association, Mr. Buchanan, chief of the Department of Agriculture of the Columbian Exposition, who had been invited to see it, stated to the chief of the Department of Machinery that it was extraordinary and novel. Almost every operation was done by machinery, and the business of "packers' supplies" has become a large one. The introduction of machinery greatly reduced the price of goods and increased the output. Meantime the old, original method of cooking (or processing, as it is called) the goods in open kettles in plain boiling water was improved upon by adding salt to the water to increase its density and thus gain greater heat and quicker results. About 1858 this was further improved by substituting chloride of calcium for the salt; and later, steam-kettles, having a cover and containing a coil of steam-pipe, were patented by A. K. Shriver and G. W. Fisher, both of Baltimore, and these have superseded all other methods for processing foods. Machinery likewise revolutionized the making of cans, until at present they are made by hundreds of millions in special factories, by "systems" that have almost banished the use of manual labor in their production.

The growth of the industry, the multitude of firms, the rapid cheapening of the goods, and the popularity of the business, which requires hermetical sealing and therefore exclusion of the goods from sight, made the fixing of grades and terms of sale and delivery absolutely necessary. Growing in a century from nothing to a vast industry, and peculiar in its nature, it was entirely without commercial rules. The first commercial organization of packers of canned goods met at Philadelphia in October 1872, but had only a brief existence. In February 1883 a Canned Goods Exchange was organized in Baltimore, that city then being the great centre and producer of these goods. A. L. Scott was its first president, and R. Tynes Smith its first secretary. The intention was to have regular sales on the floor daily, but this plan was abandoned. It, however, adopted grades for goods, rules and terms to govern transactions, and laid the foundation of commercial procedure for the business.

In 1885 the packers of the Mississippi Valley organized in Chicago under the title of the Western Canned Goods Packers' Association, with William Ballinger, of Keokuk, Ia., as president, and L. G. Seager, of Gilman, Ia., as secretary, and this has been a successful and powerful influence in the business, under the guidance of wise and tireless officers. It is based on the principle of mutual exchange of private statistics among members. The packers of the State of New York organized about the same year, with T. L. Bunting, of Hamburg, as president, and J. G. Gibson, of Utica, as secretary, with quarterly meetings and the statistical principle. Virginia and New Jersey organized about two years later, each locally.

The basis of a national association was laid at Indianapolis, in February 1889, at a meeting of a number of representatives of the local associations, thus making it of a federal nature; the plan being submitted by Mr. Bunting, of New York. This was consummated at a meeting in Baltimore in May of the same year, by representatives from all the minor associations. L. G. Seager, of Gilman, Ia., was chosen its first president, and E. S. Judge, the publisher of 'Trade,' as secretary. There is nothing of the nature of a trust in the organizations of the packers; they are based entirely on the advantage of mutual information and general business rules.

In 1894 the Peninsula Packers' Association was organized at Dover, Del., with James Wallace as president and C. M. Dashiell, of Princess Anne, Md., as secretary. The "Atlantic States Canned Goods Packers' Association" was also organized in the fall of the same year at Baltimore, with E. H. Thurston, of Mechanic Falls, Me., as president, and H. P. Cannon, of Bridgeville, Del., as secretary. These bodies are also members of the National Association.

In 1900 there were in the United States over 2,000 known canned-goods, packing-firms, distributed among 42 States and operating about 2,200 canneries, of which Maryland had twenty-five per cent; Maine, seven per cent; New York, six per cent; Ohio, Illinois, and Virginia, three and one half per cent each; California, five per cent; Indiana, three per cent, and the other States ranging from fifty-six factories in Pennsylvania down to one in Arizona. The total output of canned goods is computed to have been about 700,000,000 cans of all sizes and kinds. The principal articles packed are tomatoes, corn, milk, oysters, corned beef, salmon, sardines, peaches, peas, beans, apples, pears, pineapples, small fruits, and pumpkins. They are important in about the order given, although values of the aggregate packs may not run in the proportion of the number of cans.

There is a species of sectionalism about the packing, due mainly to climatic influences. Thus, the principal corn-packing States are Maine, New York, Maryland, Illinois, Iowa, and Kansas. Tomatoes are more southern in their trend — New Jersey, Maryland, Indiana, Virginia, and Kentucky being the heaviest packers, while New York, Ohio, and Illinois have the principal milk-canneries. Cove oysters are confined to Maryland, Virginia, North Carolina, Florida, and Mississippi. Beef has been packed in many sections, but the States north and west of the Ohio now almost monopolize this line of canning. Salmon is now only packed on the Pacific coast, and Alaska is the main source of supply for the market, the canneries multiplying there as the fish have fled from the over-fishing of civilization.

Maine monopolizes the American sardine-packing, as it does lobster-packing, except what is done in Canadian waters. Peaches are packed principally in Maryland, Delaware, California, and Michigan; Georgia is, however, annually increasing the number of her canneries of this fruit. Peas are packed principally in Maryland, New York, Ohio, Indiana, and of late in Delaware; but many of the States in the upper Mississippi valley are steadily increasing their output. Beans are of three kinds: string beans, baked beans, and lima beans. The first named are a heavy but profitless pack, being put up in all sections to fill time between other crop seasons; the second have their headquarters in Massachusetts, though New York is a strong second, and the article is being added to the list of packers' products in canning-houses everywhere. Lima beans find most packers in New

York, Maryland, California, and Ohio; the Pacific coast furnishing large quantities that in a mature state come east to be packed in winter as soaked goods. Apples are annually becoming a heavier pack in tin — Maine, New York, Maryland, Ohio, Illinois, Iowa, and Kansas putting up large amounts, and the industry is spreading to the new apple fields of Washington and Oregon. New York and California are the principal packers of pears, Maryland and Delaware also doing much in them. Pineapples, now one of the favorite fruits in tin, are packed mainly at Baltimore, Md., but the packing of them is extending in all directions. Small fruits have declined in the quantity packed till the pack of 1900 was probably not over one fourth the number of cans put up in a year 20 years ago. California is the great packing region for small fruits, but a varying amount is annually put up by canners in all sections. Pumpkin is almost entirely confined to the northern States. Soups are packed principally in New York and Illinois, but the output of this class of goods is being increased by large canneries in several of the other States. There is an almost endless line of varieties of canned goods, from green figs in Mississippi and Texas to turtle in Florida, and dandelions and mince-meat pies in New York.

The annual aggregate values of these goods amounts in an average year to over $82,000,000. Besides the market it has made for the agriculturist, it has made a demand for labor in the cannery and its work, which requires at least 400,000 people in the height of the season. They would require over 2,000,000 boxes of tin-plate for the cans, about 30,000,000 cases, and 700,000,000 labels. Such is the business to-day that 100 years ago had just been shown to the public in a foreign country. The genius of this American republic seized on this idea of the humble Frenchman, and has made of it a great industry and a new article of quotation in the markets of the world. Its vastness is due entirely to the ability of the American workmen to secure and consume the good things of life in all climates and all seasons. See also PACKING INDUSTRY.

E. S. JUDGE,
Sec'y Natl. Assoc. of Canned Food Packers.

Cannizzaro, Stanislao, stän ĭs lä'ō kän-nē-tsä'rō, Italian chemist: b. Palermo, 16 July, 1820. He studied medicine at Palermo, and chemistry at Pisa. In 1848 he was a member of the Sicilian Parliament and had part in the revolution in Sicily. In 1852 he became professor of chemistry in Alessandria; in 1857 in Genoa; in 1860 in Palermo; and in 1870 in Rome. He emphasized by clear definition the difference between atomic and molecular weights, and was one of the most influential in establishing Avogadro's law as a maxim of chemical science. He also discovered benzyl-alcohol and cyanamide. He wrote 'Sunto di un Corso di Filisofia Chemica, e Nota Sulle Condensazioni di Vapore' (1880); 'Relazione Sulle Analisi di Alcune acque Potabili' (1882); and 'Abriss eines Lehrganges der theoretischen Chemie,' which appeared in Ostwald's 'Klassiker der exakten Wissenschaften.'

Can'nock, England, a town in West Staffordshire, seven and one half miles northwest of Walsall, in the district known as Cannock Chase, which is rich in coal and ironstone. Manufactures of boilers, edge-tools, bricks, and tiles, are carried on, and there are numerous collieries. Pop. (1901) 23,992.

Can'non, Frank Jenne, American politician, son of George Q. Cannon (q.v.): b. Salt Lake City, Utah, 25 Jan 1859. He was graduated from the University of Utah in 1878, and has since been engaged in journalism. He was United States senator, 1896–9, and has been prominent as a Silver Republican.

Cannon, George Lyman, American geologist: b. New York, 10 March 1860. He was educated at the University of Colorado and the Colorado State School of Mines, and has been an instructor in geology and biology in the Denver High School from 1887. He has published 'Geology of Denver and Vicinity' (1894); 'Outlines of Geology' (1895); 'Nature Study for Denver Schools' (1895); 'The Protection of Colorado Birds' (1899).

Cannon, George Q., American politician: b. Liverpool, England, 11 Jan. 1827; d. Monterey, Cal., 12 April 1901. He went with his parents to Nanvoo, Ill., in 1844, and was one of the earliest settlers in Salt Lake City. He was a member of the Legislative Council of Utah in 1865–6 and 1869–72, and was a delegate to Congress from 1865 to 1881. At a Constitutional Convention at Salt Lake City in 1872 he was chosen to present the constitution and memorial to Congress for the admission of the Territory into the Union as a State. He translated the 'Book of Mormon' into the Hawaiian language. His son, Frank J. Cannon, was elected one of the first two United States senators from Utah in 1896.

Cannon, Henry White, American bank president: b. Delhi, N. Y., 25 Sept. 1850. He was educated at Delaware Academy in his native town and engaged in banking. He was comptroller of the currency, 1884–5, and was a member of the International Monetary Conference at Brussels in 1892. He is a director of several important railroads and of the Manhattan Trust Company, and president of the Chase National Bank in New York.

Cannon, Joseph G., American politician: b. Guilford, N. C., 7 May 1836. Admitted to the Illinois bar, he was State's attorney of Vermillion County, 1861–8. He was a member of Congress from 1873 to 1891, and again, 1893–1903. He was 20 years on the Committee on Appropriations, and its chairman in the 55th and 56th congresses. He is rugged and unconventional in manner and a ready and fearless debater.

Cannon. See ORDNANCE.

Cannon-ball Tree, a large tree (*Couroupita guianensis*) of the order *Lecythidaceæ,* a native of Guiana, with a hard, woody, globular fruit six or eight inches in diameter — whence the popular name of the tree. It has large white or rose-colored flowers growing in clusters on the stem and branches. The pulp of the fruit is pleasant to eat when fresh.

Cannstadt, kän'stat, **Cannstatt,** or **Kanstatt, Germany,** a town in Würtemberg, in a beautiful and fertile district on the Neckar, two miles northeast of Stuttgart. Its antiquity is proved by the Roman remains found. It has celebrated and much-frequented mineral springs, active and varied industries, including the man-

ufacture of cotton and woolen goods, machinery, etc. Here are also railroad shops and dye works. The Neckar is here crossed by two bridges. Pop. (1900) 26,500.

Cano, kā'nō, **Alonzo,** Spanish painter, sculptor, and architect: b. Granada, 19 March 1601; d. 5 Oct. 1667. He became so distinguished in each of these arts that his countrymen called him the Michael Angelo of Spain, although the title is due more to his versatility than to any resemblance in point of genius to the great Florentine. His 'Conception of the Virgin,' in the church of San Diego, at Granada, is considered his masterpiece. His works in sculpture and architecture are also numerous. He was a contemporary of Velasquez, and in 1639 was appointed court painter to Philip IV. His ungovernable temper on various occasions brought him in danger of the inquisition, and he was once put on the rack on suspicion of having killed his wife in a fit of jealousy, but was subsequently absolved from the charge. On this occasion his right arm was exempted from torture, as being *excellens in arte.* As an illustration of his whimsical character it is related that on his deathbed he refused to take the crucifix from the priest on account of its bad workmanship.

Cano, Juan Sebastian del, hoo-ān' sā-bās'-tē-ān dĕl, Spanish navigator: b. Guetaria, Guipuzoca, about 1460; d. on the Pacific, 4 Aug. 1526. He was one of the first to circumnavigate the globe (1522), as captain of one of Magellan's fleet, which he afterward commanded. In 1525 he was placed second in command of a similar expedition and became its commander by the death of Loaisa.

Cano, Melchior, mĕl'kē-ôr, Spanish theologian: b. Tarrancon, 1523; d. Toledo, 30 Sept. 1560. He was a member of the Dominican order and an opponent of the Jesuits. He was professor at the universities of Alcantara and Salamanca, and was made bishop of the Canaries, but did not live in his see. He wrote 'De Locis Theologicis,' and many other theological works.

Cano y Masas, Leopoldo, lā ō pold o kā'nō ē mā'säs, Spanish poet and dramatist: b. Valladolid, 13 Nov. 1844. He graduated from the Spanish Military Academy at Madrid (1865), and was appointed professor of analytical and descriptive geometry there in 1867, retiring in 1885. His first comedy was 'Laurels of a Poet' (1852). His many other plays include: 'The Code of Honor'; 'Modern Idolatry'; and 'The Death of Lucretia.' He is the author of a volume of poems, entitled 'Arrows.'

Cano'ba, the Indian Apollo, or god of inspiration.

Canoe, ka-noo', a light boat designed for propulsion with a paddle or paddles. The term is very commonly used to designate the small vessels used by uncivilized people living near the water. The name is of West Indian origin, the Carib word being *canáoa.*

Canoes are built in divers forms and of various materials. Doubtless the most primitive form is the hollowed tree-trunk; the excavation, before the advent of adequate cutting-tools, being accomplished by means of fire. This form is of wide distribution, being found in Africa, South and Central America, China, and the islands of the South Pacific and Indian oceans. In the form known as a "dugout" it is common in the United States. Among the island races of the Pacific the stability of the canoe is largely increased by the adoption of an outrigger, which, of varying forms, prevents capsizing on the one side by its weight and leverage, and on the other by its buoyancy. Many of these islanders sew planks together to form their canoes, making the joints watertight by means of gums, etc. Others use double canoes united by a strong platform. Such a vessel is capable of carrying a number of persons and a considerable lading. In South America, where large trees are abundant, very large canoes are constructed. The same is true of Africa, where the war-canoes of the native kings carry very large crews. They are often fantastically carved and ornamented.

As stated above, the propelling force of the canoe is usually the paddle, but sails are often used, particularly on sea-going craft.

The Esquimaux canoe is known as a *kayak.* This consists of a light wooden or bone frame covered with seal-skins sewed together with sinews. The skin covering extends across the top, forming a water-tight deck with but one opening amidships to admit the boatman. A hoop is fitted to this opening, and after the boatman has entered he fastens himself in by means of an apron so that the whole boat is watertight, and he becomes, as it were, part of the craft. So intimate is this union, and so skilful are the Esquimaux in the management of their kayaks, that the boatman can with a twist of his paddle capsize the craft and turn completely around under water, coming up again on the opposite side to that he went over. The paddle is about 10 feet long and double-bladed. The *oomiak,* or women's boat, is also made of seal-skins sewed over a framework; but it is of large, even clumsy build, and but for its propulsion by paddles might be classed as a boat rather than as a canoe. It is designed as a transport for women, children, and household goods rather than for the chase, for which the kayak is principally used.

The Aleuts build large skin boats, somewhat resembling the Esquimaux oomiak, which are propelled by paddles. Such a boat is known as a *bidarkee.* Other tribes of the west coast build large canoes of wood, the war-vessels being, like those of Africa, curiously decorated.

A peculiar form of canoe is found in the Kootenai district and on the Columbia River. While most canoes are constructed with the bow and stern either perpendicular or with a flaring overhang, these Kootenai craft are shaped, both at bow and stern, like the ram of a warship. In other words, the greatest length is along the bottom. These canoes are generally about 15 feet long and are constructed with a light framework of cedar covered with spruce or white-pine bark. This bark is cut off in one piece in the spring, when the sap is running, and is turned inside out, bringing the smooth side in contact with the water. The canoes are sewed with rawhide or tendons, and cracks and knot-holes are stopped with resin. Two squaws will make a canoe in four or five days; the chief difficulty being to get the bark off whole and to turn it wrong side out successfully.

The North American Indians have brought the canoe to its highest state of perfection. With the most frail material, birch bark, they construct a craft so light that it may be carried by one man, and yet so strong and buoyant that it will carry a very considerable load. A framework of light but tough wood is covered with sheets of birch bark, which are sewed together; the seams being waterproofed with resinous gums. They are propelled by means of a single-bladed paddle, which is dipped on one side only (a slight twist correcting the tendency to swerve from a straight line), or alternately on either side. The use of the birch-bark canoe by the Indians of the United States is rapidly becoming a thing of the past; but the art of building them has been preserved by their construction as pleasure-craft.

A form of canoe of recent invention is used solely for pleasure. About 1865 John Macgregor, impelled by a love of adventure, sought recreation on the rivers and fjords of Europe as well as on the waters of Egypt and Palestine. He developed his model from the Esquimaux kayak, and evolved a clinker-built craft of cedar, about 14 feet long and 2 feet in beam, entirely decked over with the exception of a "well" in which the canoeist sits. This is propelled by means of a double-bladed paddle, but a short mast enables the carrying of a sail. In a canoe of this type, which he named the Rob Roy, Macgregor cruised on the Danube, the Jordan, the Nile, the Seine, and on Norwegian fjords. From this early model other forms have been evolved, notably the Nautilus and Shadow types. Water-tight compartments ensure permanent buoyancy. Centre-boards counteract leeway when under sail on a wind. The interior space is so arranged as to provide a sleeping-place for the cruiser.

There are many canoe clubs in the United States, England, and Canada, and the canoe may be seen on all the coastwise and inland waters of those countries, as well as on the continent of Europe.

See article by W. Baden-Powell in the 'Encyclopædia of Sport' (1897); Hicks, 'Yachts, Boats, and Canoes'; Powell, 'Canoe Traveling'; the works of J. Macgregor ("Rob Roy"); Hayward, 'Canoeing with Sail and Paddle'; Field, 'Canvas Canoes.' ELFORD E. TREFFRY.

Canon, Johann, yō'hän kä'nōn, Austrian painter: b. Vienna, 13 March 1829; d. there, 12 Sept. 1885. He entered the Austrian army and in 1848–55 was lieutenant of cuirassiers, but even while in the army had given much attention to painting, and finally devoted his whole time to it. His name first became known through his picture 'The Fishermaiden,' exhibited in 1858. His work includes genre pictures, historical paintings, and portraits; the latter are thought to resemble Rubens or Van Dyck in style. Among his other paintings are 'Cromwell Beside the Corpse of Charles I.'; 'The African Lion Hunt'; 'Flamingo Hunt'; and the 'Fish Market.'

Cañon, or **Can'yon,** in physical geography, a great ravine or gorge; a deep, trench-like river valley with nearly vertical walls. It is the simplest type of river valley and is formed by a young stream in its torrent stage. Thus a cañon is, geologically speaking, of recent date, and is more likely to be found in an arid region than in one of average rainfall, since its growth is due to the down-cutting action of the stream being faster than the general lowering of the land surface by rock-weathering and rain erosion. In southern Arizona, New Mexico, southern Utah, and Colorado, a great plateau 7,000 to 8,000 feet high has been elevated since Tertiary time, as shown by the latest rocks being of Tertiary age. They lie in horizontal strata, and the streams crossing the plateau have cut deep trenches with nearly vertical walls, exposing rocks of all ages down to the basement granite. Here the drainage is several thousand feet below the surface of the plateau. The Grand Cañon of the Colorado is 300 miles long. The average width from rim to rim does not exceed 10 miles throughout the widest portion of the cañon, and it frequently narrows to eight miles. The river does not occupy the middle of the gigantic trough, but flows at a distance varying from one to three miles from the south side. Practically all of the magnificently sculptured pinnacles and so-called temples lie north of the river at distances of from five to seven miles from view-points usually visited by tourists. The depth of the Grand Cañon measured from the south rim is considerably less than a mile. From the rim at the Bright Angel Hotel, where the altitude is 6,866 feet above sea-level, to the high-water mark of the river at the foot of the tourist trail, the drop is 4,430 feet. The highest point on the south rim at the Grand View Hotel is 7,496 feet, about 4,900 feet above the river. From the north side, however, the drop to the water level averages considerably over a mile and in places exceeds 6,000 feet. In a general way it may be said that the north rim is 1,000 to 1,200 feet higher than the south, thus producing the high, even sky-line so impressive to the tourist. It is altogether unlikely that such a chasm could have been carved through similar rocks in a region of average rainfall, as lateral torrents would have greatly widened the valley. Of other cañons and gorges in the Western States may be mentioned the gorge of the Columbia, where it breaks through the lava flows of the Cascade Mountains, 2,500 to 3,000 feet deep. It was eroded in Quaternary time. In California the gorges of the north and south forks of the American River are 2,000 to 3,000 feet deep; the cañon of the Merced River, including the Yosemite valley, is 3,000 to 5,000 feet deep, and the Grand Cañon of King's River 3,000 to 7,000 feet. In some of these cases the stream has cut its way down rapidly enough to form a cañon by following a fault-plane or other line of weakness in the rocks. In parts of the West the word cañon is used very loosely, being applied to almost a ravine or even a gulley.

Can'on (Greek, a rule, measure, or standard). 1. In the arts: When art has succeeded in producing beautiful forms the question arises, with what proportions beauty of form is united. Artists of genius first started this question, and imitators, inferior to them in talents, scrupulously followed their results, and naturally exalted some existing work into a model for every performance. Among the Greeks the celebrated statuary Polycletus (452–12 B.C.) first instituted such inquiries; and as he generally represented youthful, pleasing figures, it is probable that he fixed the standard of beauty in the youthful form. The canon (the model statue) of Polycletus was accordingly a statue which was

made principally for the purpose of showing the beautiful proportions of the human form in a youth just ripening into manhood. No copy of it is known to exist; the artist probably gave his model of proportion a quiet, simple attitude, without any strong distinguishing marks. His successors imitated it without deviation. Polycletus was not the only Greek artist who pursued such investigations respecting the proportions of form. Among the moderns, Dürer and Leonardo da Vinci have devoted themselves to similar inquiries.

2. In Scriptural literature, a term employed to designate the collection of books containing the rule or standard of primitive Christianity; that is, the canonical books of the Holy Scriptures. The canon of the books of the Old Testament, as contained in the Hebrew Bible, receives in this form equal respect among all Christians, because Christ and the apostles have expressly appealed to them, and in this way pronounced them writings inspired by God. There are certain books, however, belonging in subject to the Old Testament, but whose canonical character the Jews did not acknowledge, and which Protestants class together under the head of Apocrypha, and reject from the canon. For these there is only a Greek, and not a Hebrew text. The Western Church accepted them as canonical in the African Council, about the end of the 4th century; but the opinions of the clergy respecting them remained for a long time divided. St. Jerome denied their canonicity, and many theologians coincided with him. The Roman Catholic Church finally declared them canonical in the Council of Trent. (See APOCRYPHA.) Respecting the number of books belonging to the canon of the New Testament, the opinions of Christians were much divided till the 6th century. As early as the 2d century the separation was made into the Evangelicon (the four Evangelists) and the Apostolicon (the Acts and Epistles of the Apostles). The five historical books, the Epistles of Paul, the First Epistle of Peter, and the First Epistle of John were universally acknowledged to be genuine in the 3d century; hence Eusebius, in his 'Ecclesiastical History,' written about 325 A.D., calls them *Homologoumena* (universally received). The other five catholic epistles (Second of Peter, Second and Third of John, Jude, and James) he calls *Antilegomena* (doubtful, not universally received). At that time the Epistle to the Hebrews was considered genuine by most persons, and the Apocalypse by many. These books were received in the second half of the 4th century in the Egyptian Church (where Athanasius first used the term canonical), and in the Western Church. In the Eastern Church, properly so called (the dioceses of the patriarchs of Constantinople, Antioch, and Jerusalem), only the catholic epistles were of canonical authority at that time; the Apocalypse not till the 6th century. The canon of the New Testament has since remained unaltered, and the Protestant churches hold it in common with the Greek and Catholic churches. The results of critical examinations of the genuineness and canonical character of the single books of the Bible, even when they were unfavorable to the books, have produced no alteration in the established canon. The reasons of the ancient fathers of the Church for or against the canonical character of the biblical books were merely historical and traditional, and built on philological criticism; they are still the most tenable and rational; the philosophical grounds are more subject to be affected by extraneous influences.

3. In ecclesiastical use, a rule or law of doctrine or discipline as established by ecclesiastical authority. The term is farther applied to various matters of church organization and ceremony; also to books containing the rules of religious orders, etc., and to a list or catalogue of acknowledged and canonized saints in the Roman Catholic Church.

Another distinctive ecclesiastical use of the term is that which designates a dignitary possessing a prebend, or revenue allotted for the performance of divine service in a cathedral or collegiate church. Canons were originally priests who lived in community, appointed to assist the bishop in his duties, and supported by the revenues of the bishopric. Secular Canons are those who, in progress of time, have left off the custom prevalent in monasteries of living a community life, and have the privilege of enjoying the returns of their respective benefices. The obligations of the canons are contained under three heads: (1) the duty of residing in the place where the church they belong to is situated; (2) assisting at the canonical offices which are celebrated in the church; and (3) attending the meeting of the chapter at the appointed times. They cannot be absent from their benefices for a longer period than three months, and are obliged to sing or recite their office in choir. In their collective capacity they are called a chapter, and form the council of the bishop. In each chapter there are dignitaries. The name was originally applied to all the clergy, but was afterward confined to those who were connected with the cathedral church, or to specially privileged churches.

4. In music, with the ancient Greeks, the term canon signified what now is called monochord. At present it signifies a composition in which the several voices begin at fixed intervals, one after the other, and in which each successive voice sings the strain of the preceding one. In Italian, therefore, it is called fuga di conseguenza; in Latin, canon perpetuus, or continuous fugue; in German, Kreisfuge (circulating fugue). Sometimes each voice begins with the same, sometimes with different notes. The phrase or passage for imitation is called the theme or subject, the imitation the reply. Canons may be finite or infinite. The former end, like any other compositions, with a cadence, while the infinite canon is so contrived that the theme is begun again before the parts which follow are concluded. A canon may consist of two, three, four, or more voices. Canons differ from ordinary fugues; for, in the latter, it is sufficient that the subject be occasionally repeated and imitated according to the laws of counterpoint; but, in the former, it is essential that the subject be strictly repeated by all the succeeding parts; which repetition may be made in the unison or octave, the fourth, or the fifth, or any other interval of the scale. There are several other canons, as canon polymorphus, canon per diminutionem, and canon per augmentationem. Sometimes, also, a musical passage of a composition in which one voice repeats for a short time another, is called, improperly, a canon.

5. In printing, canon is the name given to a large type which is so called from the early use of it for printing the canon of the mass and the Church service-books.

Cañon City, Col., a city and county-seat of Fremont County, situated on the Arkansas River, near the mouth of the Grand Cañon, and on the Denver & R. G., and the Atchison, T. & S. F. R.R.'s. It is a well-known health resort, over 5,000 feet above the sea-level, with an excellent climate and hot and cold mineral springs. In the vicinity there are valuable deposits of limestone, coal, and iron. The river furnishes abundant water-power. Pop. (1900) 3,775.

Canon Finch, Towhee, Wren. See FINCH, TOWHEE, WREN.

Canon Law. Canon law is so named because it consists of rules or canons, which are established to guide the faithful to eternal happiness. In a strict sense, canon law comprises only those laws which emanate from an ecclesiastical authority that has supreme and universal jurisdiction. In a wide sense, it takes in also those laws enacted for the good of the faithful by anyone having ecclesiastical authority. The sources or fountains from which canon law has originated are: Sacred Scripture; divine tradition; laws made by the Apostles; teachings of the Fathers; decrees of the sovereign pontiffs; ecumenical councils; certain congregations of cardinals under orders of the Pope; custom, which, however, could in no case be contrary to divine law, common sense, good manners, public order, or the spirit and the rights of the Church. The Old Testament contains three sorts of precepts, moral, ceremonial, judicial. The moral code remains in full force under canon law; the ceremonial and judicial laws have lapsed. The New Testament is the chief source of ecclesiastical law. It contains also dogmas of faith, but with these canon law does not deal except indirectly. By tradition is meant a doctrine not written by its first author, but conveyed by word of mouth. Usually it is subsequently put into writing. Traditions, considered in their source, are divine or human. Divine are those which have God for their author, and which the apostles received either directly from Christ or by the suggestion of the Holy Ghost. Human traditions are termed apostolic if they originate with the apostles, or ecclesiastical if they come from the successors of the apostles, called bishops of the church. Divine traditions bind all the faithful; human only those of the localities and times to which they are applicable. Some of the enactments attributed to the apostles are: the Apostles' Creed; abstinence from things sacrificed to idols, and from blood and from things strangled, part of which prohibition has lapsed; the substitution of the Sunday for the Sabbath of the Jews; the institution of certain feast days; the fast of Lent. The sentences of the fathers, approved by the Church and made into universal laws by councils or the Roman pontiffs, are part of canon law. These sayings were not inserted in the collection of canons before the 6th century, John Scholasticus being the first to do this in the East in that century, and Regino first in the West in the beginning of the 10th century. To the student it is evident that the constitutions or decrees of the Roman pontiffs constitute the chief source of canon law; in fact, the entire canon law in the strict sense of the term is based upon the legislative authority of the Pope. To understand this it is necessary to recall that in the Catholic doctrine all authority in the Church comes from above, not only in the office of priesthood, but also in the matter of jurisdiction or power of ruling. Catholic writers hold that the primacy or headship in the Church was established by Christ in Peter before the priesthood was conferred on him and the other apostles, the purpose of the Savior being to effect unity in his organization. The church thus organized is a spiritual monarchy; elective it is true, but not an aristocracy or democracy. Other religious organizations hold quite the opposite doctrine and would make their unity be a coalition of equal parts. This point of primacy of the Roman pontiff is also the line of separation between the canon law of the west and that of the separated Greek and the Russian churches, the review of which is given later in this article. Ecumenical councils, whose decrees are a source of canon law, are those meetings of the bishops of the church throughout the world, which are held under the presidency of the pope or his legates, and whose acts are by him confirmed. There are twenty councils recognized as ecumenic; the first being that of Nicæa in 325; the latest that of the Vatican in 1870.

During the first three centuries, the church was administered according to the scriptures only and the rules laid down by the apostles and bishops, as occasion required. Thus Clement, the disciple and successor of Peter, mentions the rule given by the apostles concerning the succession of bishops, and Ignatius the Martyr, in his epistles, exhorts his followers to diligently and tenaciously observe the traditions of the apostles. Thus, too, in the controversy concerning the celebration of Easter, the contestants on each side alleged the apostolic tradition. But councils were held at Ancyra and Neo-Cesaræa in 314, at Nicæa in 325, at Antioch in 322, at Sardica in 347, at Gangra from 362 to 370, at Laodicæa between 337 and 381, at Constantinople in 381, at Ephesus in 431, and in the council of Chalcedon in 451 a collection of canons made up from these previous councils was read and partly authorized for the entire church. With the exception of those of Sardica, which are in Latin, the canons of all these early councils were formulated in Greek. The name of the compiler of this first collection is unknown and few of these early canons have reached our times, only their tenor being known through subsequent use in the western church, especially in Spain. After the emperors assumed the Christian religion, ecclesiastical legislation became important, and the laws of the church were therefore in the year 438 inserted in his collection by the emperor Theodosius II. Valentinian III. afterwards adopted this collection for the West. About this time — the latter half of the 5th century — a compilation was made of the so-called apostolic canons and constitutions together with decrees of some of the councils. Originally there were 50 canons called apostolic, but their number was afterwards increased to 85, some of which are certainly spurious. In the East these were received as having the stamp of authority, but not so in the West, where their origin was doubted. However, Dionysius adopted the smaller collection of 50,

considering them useful for discipline, and thereby without determining their origin procured for them in Rome the stamp of authority. John Scholasticus made a collection of canons for the Greek church in 564, to which he added 68 canons taken from Saint Basil. He divided the work into 50 titles. To this he later added the laws of the empire which had relation to the laws of the church, and the new compilation became known as Nomo-canon. The emperor Justinian II. in 692 assembled a council in his palace at Constantinople, called the Trullan Council from the room in which it was held, and 102 canons were enacted. When the acts and canons of this council were submitted to Pope Sergius at Rome for approval he refused even though the emperor ordered his armor-bearer to bring the Pope to Constantinople. The Trullan compilation consisted of the so-called Canons of the Apostles, those of the ten councils previously mentioned, the canons of the synod of Carthage, the decrees of a synod in 394 at Constantinople under Nectarius, the canonical decisions of the twelve Eastern patriarchs and of some bishops from the 3d to the 5th centuries, the canon of a council held at Carthage under Cyprian in 256, to all of which were added the 102 canons drawn up by the Trullan council itself. Afterwards 22 canons of the second council of Nicæa held in 787 were added. On this foundation the church law of the East was based up to the middle of the 9th century. By the Trullan synod, priests were allowed to marry, which up to that time was against the canon law of both the Eastern and the Western church. The Trullan synod also sanctioned the Canons of the Apostles, one of which teaches the doctrine of the re-baptisers, which had been previously repudiated by Pope Gelasius. Herein is noticed the first real divergence between Eastern and Western canon law. Photius, who was intruded into the see of Constantinople, called a council against the patriarch Ignatius in 861, and 17 canons made by this council were added to the codex of the Greek church. He also formulated a new collection, in which the second part, called the Nomo-canon remained unchanged. The emperor Leo the Philosopher, who deposed Photius, rescinded his collection of laws, but nevertheless the seeds of the separation of the Greek church from that of Rome had been implanted by the work, although a complete schism took place only later in 1054 under Michael Cerularius. From time to time new ecclesiastical constitutions issued from the emperors, as from Leo Philosophus in 911, from Constantine Porphyrogenitus in 961, from Alexius Commenus in 1118, from Isaac Alexius in 1185–90. The resolutions of synods summoned by the patriarchs of Constantinople, epistles of renowned bishops and their decisions, formed another addition to the canon law of the eastern church. The first commentary on the Greek codex was undertaken by Theodore Prodromos in the 8th century. The second, containing the text with a commentary, is the Nomo-canon of Doropater. The monk John Zonares composed a comprehensive verbal interpretation in 1120, using the collection of Photius as a basis. Fifty years later, Theodore Balsamon made a commentary with a view to practical questions, comparing the canons with the civil law and insisting that Justinian's maxims only applied when comformable to the Basilics. He added many matters not found in the collection of Photius. Epitomes of canon law were composed at a comparatively early period, the author of the first of which appears to have been Stephen of Ephesus in the 5th century. There is a synopsis by Aristenus augmented by Alexius Aristenus in 1160, and another by Arsenius, a monk of Mount Athos, in 1255. Constantine Harmenopoulos in 1350 composed an epitome of the spiritual law in six parts, using, with some omissions, the collection of Photius as altered by Zonares. In order to reduce canon law to a more practical form than it appeared in the collection of Photius and at the same time present a more comprehensive work than these epitomes, Matthæus Blastares drew up his syntagma in 1335, divided into chapters of different lengths and arranged according to the principal word of these rubrics, the numbers of the chapters commencing anew under each letter. Each chapter begins with the ecclesiastical law, followed by the civil law applicable to it, without, however, mentioning the source of the latter. This work came into very general use among the clergy. The collection of Photius and the syntagma of Blastares continued still in use under the Turkish rule and were alike termed Nomo-canon and, metaphorically, the 'Rudder.' The collection and interpretation of Zonares also obtained canonical authority. From these materials many extracts were translated into modern Greek up to the 18th century, and several text books composed for the use of the clergy, some of which were printed in Venice. Lastly a comprehensive collection was published in 1800 at the instance of the patriarch and synod. It contains the old Greek text of all the authentic canons of councils since Photius and Zonares, to which are added interpretations of the authentic commentators in modern Greek, especially those of Zonares and Balsamon. In the interpretation, the canons of those fathers are taken into account which had not been confirmed by any general synod, but had obtained a canonical authority. Nothing was inserted from the municipal law works which did not agree with the canons. Several appendices were added, including formulas for ecclesiastical business, and upon these and similar collections is founded the present law of the Greek separate church. The Russian followed the Greek church in adopting compilations of church law up to the end of the 15th century. In 1550 certain regulations respecting the jurisdiction of bishops were introduced. Some canonical epistles and rules drawn up at councils are used in addition to the Greek codex, and manuals adapted to the country have been compiled therefrom. Peter the Great in 1721 changed the chief executive authority in the church from a patriarch into the Holy Synod, by decrees of which the church to-day is ruled. By an arrangement lately made with the Roman pontiff the bishops and priests under Roman jurisdiction are ruled by the canon law of Rome, subject to the civil laws of the Russian Empire, and to prevent complications, Russia, besides a resident minister and two secretaries, has at the Vatican a representative agent for ecclesiastical affairs.

In the Western or Latin Church the canons of Nicæa and Sardica were the only code publicly received up to the end of the 5th century. About this time the Spanish translation of the Greek code was turned into barbarous Latin,

and became known as the Prisca. The decretals of the Roman pontiffs were added to the canons of the Greek code, as found in the Prisca, but it seems that Dionysius the Little, about the year 500, was the first to formulate a collection of the councils and the decretals. He had previously made a collection of the concilia for Stephen, the bishop of Dalmatia. The deacon Theodosius later made a new collection founded on the old Spanish and the Dionysian. A third collection termed the Avellanian, valuable for the historical documents it contains, appeared in the latter half of the 6th century. These, however, were superseded by a second edition of Dionysius, made probably in 731 under Pope Gregory II. In this edition some decrees overlooked previously were added, together with an appendix consisting of the statutes of the Roman pontiffs from Linus downwards, those up to Sericius, however, being given only in an historical form as no longer actually in existence. The German conquerors of Italy in 476 did not, although Arian, interfere with the laws by which the church was governed, but when Justinian reconquered Italy he introduced his Novellæ in the Julian translation in place of the codex of Theodosius II., and this order of things was later upheld by the Lombard kings in their edicts. In Africa the deacon Fulgentius Farrandus made the first collection in 547, termed Breviatio. This was an excerpt in 232 numbers of nearly all the Greek canons, including the Nicæan, to which was added the African concilia under Gratus in 348–9, under Genethlius in 390, and that of Carthage in 419 with its 33 canons, together with 304 taken from synods as well as an extract from the canons framed at Hippo in 393. The second African work was the Concordia of Bishop Cresconius in 690, founded upon Dionysius, but arranged in 300 titles instead of in chronological order. This work was incorporated with Dionysius and appeared under the name Breviarium. But the Arabs now put a sudden stop to all further development of canon law in this quarter. As early as the 5th century, as noted above, there was in Spain a translation of the Greek canons; in the 6th century Martin of Braga made a collection of canons, but in the 7th century Isadore of Seville held two councils, half church, half civil, the canons of which may be said almost to have formed the basis of the constitutional law of Spain in both church and state down to the 15th century. The collection of canons known as Collectio Isadoriana or Hispana was divided into two parts; the first containing the classified series of Greek, African, Frankist and Spanish canons, and the second the decretals from Pope Damasus in 366 to Gregory the Great in 604. In the 5th century an extensive but confused collection of councils and decretals was compiled in Gaul under Gelasius. It was founded upon the old Spanish version and some peculiar version of the canons of Nicæa and the Prisca. Out of it sprung several other collections; the first in the middle of the 6th century, containing the councils of Nicæa, and of Sardica, some Frankist concilia and papal decretals; the second of the same date containing Greek, African, and Gallic canons, and papal decretals in a confused order; the third in the 7th century, containing 103 numbers, many decretals, Frankist, Roman, and Italian concilia. A fourth and a fifth collection of the same century contained chiefly Frankist and Spanish conciliar decrees. After Charlemagne in 774 on his first visit to Rome had received from Pope Hadrian a copy of the Dionysian collection with some additions, he had it sanctioned in a synod at Aix-la-Chapelle as the *codex canonum* for the Frankist empire. In addition to these principal works many of the bishops composed capitularies for their own dioceses, as Boniface of Mayence, Theodulph of Orleans, Hincmar of Rheims. The 'Hispana' circulated among the Franks in a more or less corrupt form. One edition, which appeared between the years of 829 and 857, has caused great controversy, and is known as 'Collectio Pseudo-Isadoriana,' or False Decretals. The author called himself Isadore Mercator, and the name led many to believe the work that of Isadore of Seville. The best evidence shows that Levites Benedict of Mainz was the compiler, but no purpose for the forgeries in the work has been conclusively shown. After the preface and some minor apocryphal documents, the first part contains 50 of the apostolic canons taken from 'Hispana' and 60 supposed decretals of the popes from Clement in 92 to Melchiades in 314, arranged chronologically. The second part consists chiefly of canons taken from the 'Hispana.' In the third part, founded also on the 'Hispana,' the compiler has interpolated 35 decretals. A supplement contains some brief regulations regarding processes against bishops, said to be by Capitula Angilramni, a bishop of Metz. The collection was regarded as genuine by all canonists and theologians for 700 years from the 9th to the 15th century. Cardinal Nicholas of Cusa in the 15th century first expressed doubts of the genuineness of some of its contents. In the following century religious bitterness overshadowed scholarly inquiry, but it is now admitted by Protestant writers that the compilation was produced, not in the interest of the pope but of the Frankist bishops in order to protect themselves against oppression by temporal rulers on the one hand and church councils on the other. For this reason such insistence is found in the collection on the right of appeal to the pope in every major cause of a bishop and also that the pope's permission is necessary to the holding of a provincial synod. The sources from which the compiler chiefly borrowed his materials were the Bible, the fathers, genuine canons and decretals, Roman law, the works of Rufinus and Cassiodorus on church history and the lives of the popes in 'Liber Pontificalis.' Of the supposed decretals a large number are authentic although antedated and ascribed to earlier popes to give them the value of antiquity, while others embody the traditional contents of actual but lost decretals. The influence of the pseudo-Isadorian collection has been much exaggerated for it wrought no material change either in the faith or the discipline of the church, since it merely put into enactments the prevailing ideas and doctrines of that period on church government. Had it introduced a violent change the innovation would have caused a speedy inquiry into the genuineness of the work. However, it cannot be doubted that a written text often in controversy is a more forcible argument than traditional law, and hence the false decretals naturally exerted some influence.

To meet the necessity of rendering canon law more accessible from the 10th to the 12th

century at least 36 compilations were made, only the authors, titles and dates of which seem necessary for this article. The first was a manuscript under twelve heads, divided into 354 chapters, abstracted from Cresconius. The second was extracted from Dionysius and the pseudo-Isadore collection. The third is very voluminous, and taken from Hadrian's codex with numerous additions. The fourth, by an unknown author, contains portions of concilia, decretals, and extracts from the Fathers. The fifth, made by Regino, abbott of Prum, between 906 and 915, is founded on three Frankist collections, the Fathers and the West Gothic Breviary. The sixth is a Leipsic codex; the seventh a Darmstadt codex. The eighth is attributed to Rotger, Bishop of Treves in 922. The ninth is a Viennese manuscript. The tenth is also a manuscript of five books, composed in Italy in the middle of the 10th century, and is founded upon the Irish collection in 65 titles, on fragments of the Fathers, lives of the saints, decretals, Julian's 'Novellae,' with capitularies of the emperors added up to Henry I. The eleventh was addressed by Abbo, abbot of Fleury, to King Hugo and his son Robert, and consists of a treatise of 52 chapters on the church and clergy. The twelfth was composed by Burchard, bishop of Worms, in 1012–23, and contains the canons of the apostles, the transmarine, German, Gallic and Spanish councils, papal decrees, and other passages. The 13th is a manuscript in 12 books made in Germany or France. The 14th is a Terraconian manuscript belonging to the 11th century. The 15th is an introduction to discipline. The 16th is a collection taken chiefly from Halitgar, Rasbanu, Maurus and Burchard. The 17th is a rich collection in manuscript by Anselm, bishop of Lucca in 1086. The 18th is 74 titles taken from the above work, and the 19th and 20th appeared about the end of the 11th century, both taken from the works of Anselm and Burchard. The 21st is a work in 13 books. The 22d is the capitularies of Cardinal Atto in 1081 and excerpts from decretals. Cardinal Deusdedit composed the 23d in 4 books, at the end of the 11th century, from Dionysius, the Greek canons, the old Italian and Spanish-Saxon and Roman records. The 24th is by Bourgo, bishop of Satrim in 1089, and is in 10 books. The 25th is in two books and belongs to the 11th or the 12th century. The first chapter is inscribed from the Primate of the Roman church and is published with the Dionysian collection. The 26th is the decree attributed to Ivo, bishop of Chartres, and the 27th is the Pannormia in eight parts by the same author in 1090. The 28th is a large manuscript collection; first of decretals, second of councils, third of fathers, then Roman and Frank legal collections. The 29th was made under Pascal II. in 1102–18 in seven books. The 30th is attributed to Hildebert, bishop of Tours, in 1134, and may be the same as the ten books attributed to Ivo. The 31st is a manuscript in 15 books called the collection of Saragossa. The 32d is wholly extracted from the above. The 33d is taken from Burchard and Ivo. The 34th is a penitential book in nine titles belonging to the 12th century. The 35th belongs to the middle of the 12th century and is taken chiefly from Anselm of Lucca and the collection dedicated to Anselmus. Gregory, a Spanish priest, is the author. Lastly, Algerius of Liege in the beginning of the 12th century compiled a work on 'Justice and Mercy,' which contains a treatise on church discipline in three parts, taken from Anselm and Burchard for the most part. Gratian, a Benedictine monk, composed at Bologna in the middle of the 12th century a scientific and practical work on the canon law with references and proofs. The first part treated of ecclesiastical administration, the second contained 26 legal positions, with their answers, the third part concerned the liturgy of the church. The whole work is founded on previous collections and contains many mistakes. It was never approved by the church though it obtained great authority and superseded all other collections. Other collections are by Cardinal Laborans in 1182, that of Bernard of Pavia in 1190, that by Gilbert, an Englishman, in 1203. The universities of Bologna and Paris at an early period began to exercise great influence on canon law and their opinion in controverted questions was considered decisive, and was termed the authority of the schools. Gratian's collection was made the basis of lectures in Bologna and teachers of the canons were called *magistri* and *doctores decretorum*. Their teachings were soon gathered together in books of commentaries. Soon after the collection by Gratian, the Extravagantes, or decrees not yet collected, were gathered together, there being between the years 1179 and 1227 14 different compilations, only five of which received the stamp of authority. Pope Gregory IX. ordered a code to be published in which the entire body of law should be properly arranged. What was useless should be cut out, what was ambiguous should be corrected. Raymond of Pennafort was intrusted with this task, which he finished in the year 1233, and the collection was sent to the universities of Bologna and Paris with instructions that it was to be the sole authority. The whole work is divided into five books. The first treats of ecclesiastical judicature and of prelates; the second of civil suits; the third of civil causes before the episcopal forum; the fourth of betrothals and marriage; the fifth of judicial proceedings in criminal matters and of punishments. To these five books was added by Pope Boniface VIII., in 1298, a sixth book of decretals. This was followed in 1334 by the Clementinæ or collection of decretals by Pope Clement V. The Extravagantes of John XXII. in 1334 and the Extravagantes Communes (73 decretals from Boniface VIII. to Sixtus V.) were gathered by authority and made part of the code or 'Corpus Juris Canonici.' Commentaries on the 'Corpus' were made by the doctors, and systematic works for the use of courts were published. In the 15th century legal literature seems confined to these efforts. But in the 16th century Pope Paul IV. confided to a congregation of cardinals, with canonists as consultors, the work of revising and correcting the 'Corpus Juris.' Gregory XIII. approved the work of the committee and an authentic edition was published in 1580, in which the glosses are retained, and on which all subsequent editions have been based. The corrections made by the commission are marked «*cor. Rom.*» in the text. Two appendices were added, one the Institutiones Lancelotti, the other Septimus Decretalium, which contained the Extravagantes to Sixtus V. in 1590. Neither is of public authority, but both are very useful and recognized

by scholastic approval. Since then the Bullarium Benedicti XIV., which contains the constitutions of that pope, has been made of public authority. There is also a collection of papal bulls, called Bullarium Magnum Romanum, made up in 14 volumes, which was published in 1744 and continued in 1840; but it is very imperfect and only a private collection. Anyone who desires to know canon law must learn the 'Corpus Juris,' even though to-day many parts have been changed by the councils of Trent and the Vatican and by new papal decrees. In the 'Corpus' itself the different portions stand as *lex prior* and *lex posterior,* so that in cases of contradiction the latest is preferred. With certain modifications the 'Corpus' still has the force of law in matters relating to ecclesiastical judicature, to divine worship, to doctrine and discipline. It is the code still followed in the schools and used in church courts, not only as the source of argument but also as the method of procedure in many cases. The 'Jus Novissimum' in canon law consists of laws published from the time the 'Corpus Juris' was closed, that is, since the Extravagantes were inserted down to the present day, and includes the decrees of the councils of Trent and the Vatican. Except the Bullarium of Benedict XIV., mentioned above, no authentic collection has been made of the various constitutions and laws made by the Roman pontiffs since the close of the 'Corpus.' Still every genuine decretal is part of the canon law. The same may be said of the decisions of certain congregations of cardinals which have the force of law, especially that of the Council which authoritatively interprets the decrees of the Council of Trent. So evident was the need of a revision of canon law that at the ecumenic Vatican Council, held in 1870, proposals were made by a number of bishops to have a committee appointed, consisting of the most eminent canonists, to revise the 'Corpus Juris' or rather prepare a new one, omitting whatever owing to changed times was no longer applicable. Nothing was done before the adjournment of that council, but Pope Pius X. by a *motu proprio* in the year 1904 appointed a special committee of cardinals, with a number of consultors, and a canonist from each nation, to thoroughly revise not only the 'Corpus Juris' but all the canon law of the church, that general for the world and that special to the various nations. He himself is president of the committee to which he assigned the following cardinals: Seraphin Vanutelli, Agliardi, Vincent Vanutelli, Satolli, Rampolla, Gotti, Ferrata, Cassetta, Mathieu, Gennari, Cavicchioni, Merry del Val, Steinhuber, Segna, Vives y Tuto, and Cavagnis. Archbishop Gasparri was appointed secretary. At least five years will be consumed in the work, and the code thus established will hereafter be the only authorized canon law of the Latin church.

It will have been noticed that canon law is not traceable to any original code, but is a development founded on the general moral rules laid down in the Scriptures and especially in the New Testament. Neither is the Roman civil law traceable to any code, but is a gathering of principles suggested by good reasoning for promoting the civil interests of its subjects. Compared to the Jewish law, the principle upon which Roman jurisprudence was founded was very different — the former treats principally of criminal matters and is most severe in its penalties; the latter on the contrary, treats all questions as civil, and prefers restitution to punishment. When the Roman emperors had been converted to Christianity, in promoting its progress by special constitutions which then became part of the canon law, they necessarily gave to canon law much of the spirit of their civil law. Thus it happens that in the canon, as in the Roman civil law, there was little severity in criminal matters, and many cases which other peoples than the Romans treated as criminal were cognizable by a civil tribunal and an indemnification was effected by damages. Generally no crime was punished capitally, especially where no force or violence was employed. This spirit of leniency is manifest throughout canon law to the present day. During and after the 4th century wherever Roman power conquered the nations and wherever Christian missionaries converted the pagans canon law was introduced through the influence of the pope and the emperor. It permeated and modified the laws of the peoples of northern Europe, as well as those of England to a certain extent. With it necessarily came the principles of Roman civil law. The rules for the application of canon law were as follows: (1) In cases not contained in the civil law, or the rule for which was obscure, open to doubtful interpretation, or not expressly determined, if expressly and clearly resolved by the canon law, this latter formed the basis of the decision; and on the contrary, if the case was not provided for, or ambiguously resolved by canon law, when it was expressly met or its solution more clearly indicated by the civil law, this latter was to be preferred. (2) In cases of conflict, the civil law formed the rule for courts of civil, and the canon in those of ecclesiastical jurisdiction. Thus, when a matter of canon law cognizance arose in the civil courts the decision was given according to the rules of the canon law; and *vice versa,* when a question of civil cognizance occurred before an ecclesiastical tribunal. (3) Within the imperial states the civil law formed the basis, and the canon law in the papal states. (4) In matters of a feudal nature the civil was preferred to the canon law. (5) In forensic causes the canon is not presumed to differ from the civil law. When the Western empire passed under the rule of a barbarian race the Roman and the canon law were not only preserved, but to a great extent they influenced the legislation of the conquerors. Alaric, Attila, Ricimir did not disturb the outward form of Roman government. In the collection of west Gothic laws, gathered in 672 A.D., there are evident traces of the part which the Roman clergy took in the compilation. The Burgundian laws also show literal excerpts from the Roman law. Roman law is found also in the Bavarian code composed in the 7th century, as well as in the capitularies of the Franks, which commence in the year 560 and are introduced by a literal transcript of a novel of Valentinian. It is noteworthy that the German tribes did not force their laws upon their subjects in those portions of their conquests where the Roman law was acknowledged. It was natural, too, that the churches, as juristical persons, should follow the Roman law, not only on account of its connection with religion and the great degree of favor it manifested toward the Church, but

also of the accuracy of its provisions in this respect. Like the law of the Teutonic tribes, that of England is an accumulation of individual laws. While Britain was conquered by Julius Cæsar in 54 B.C., still it was only at the end of the 1st century of the Christian era that Roman manners, arts, architecture, language, and laws were introduced. The Roman law superseded the customary laws of the island and remained in force until the year 455, when Britain became derelict because of the removal of the seat of empire to Constantinople and the impossibility of the emperors defending it against the Picts and Scots. Christianity was introduced into Britain under the Roman dominion and was preached in Scotland and Ireland before the year 430. Roman literature, arts, and law, however, received a sudden check by the Saxons, who, when they invaded Britain, imposed their law upon the conquered people. The Danes subsequently did the same. Still we are informed by the Venerable Bede that Ethelbert, king of Kent, in 613, with the assistance of his wise men, made certain decrees and gave judgments between his subjects in conformity with the principles of Roman and canon law, at least so far as regarded sacrilege, bishops, and the like. Indeed, it is not surprising that the Saxons and Danes, whose codes contained a great admixture of Roman law, should carry the same principles with them into their new settlement in England. Traces of a Roman original may be seen in the laws of Ina, king of the West Saxons, Offa, king of the East Angles, and in the laws published by Canute which were translated into Latin. Thus it happened that, when Edward the Confessor compiled a code out of the materials then at hand, much of the Roman and canon law was inserted and thus became the basis of much of the common law of England and the United States. During the dominion of the Saxons and Danes, those Britons who had fled to Wales were governed by their own princes. Howel Dha, in 940, is said to have assembled his bishops and the more literate among the laity for the purpose of revising the law which was translated into Latin at his command. In the 85th article he approves the Roman rule of two witnesses being sufficient in cases where no specific number is stated, and for holding the testimony of one to be insufficient, except of a woman in cases of rape, of a lord between two tenants, an abbot between two monks, a father between two of his children, a priest in a matter attested in his presence, and a thief turning king's evidence in the place of execution. Most of the Roman laws of this age seem to have been taken from the Theodosian code. Although the foot of the Roman soldier never trod on the bosom of Ireland, nor did a Roman general have a chance to introduce the Roman law, still the principles of canon law were enforced throughout Ireland and Scotland by Saint Patrick in his canons. One of them, translated by the Anglican Bishop Usher, reads: "Wherever any cause that is very difficult and unknown to all the judges of the Scottish nation shall arise, it is rightly to be referred to the see of the archbishop of the Irish (that is, of Saint Patrick) and to the examination of the prelate thereof. But if there, by him and his wise men, a cause of this nature cannot easily be made up, we have decreed it shall be sent to the see Apostolic, that is, to the chair of the Apostle Peter, which hath authority of the city of Rome."

In 680, at the command of Ethelred, Egfrid, king of Northumberland, Aldwulf, king of the East Angles, and Lother, king of Kent, Theodore, at that time archbishop of Canterbury, summoned a synod at Hatfield, in which the canons of the five general councils of Nicæa, Constantinople, Ephesus, Chalcedon, the second of Constantinople, were enforced, together with the Concilia drawn up under Pope Martin at Rome in 648. He also collected in his capitularies the most important points of church discipline. Later he wrote his 'Book of Penances.' In the latter half of the 8th century, Egbert of York made an extensive collection of canon law from the sources then existing. He also wrote the book 'De Remediis Peccatorum.' In the 8th century a collection was made in Ireland in which the Dionysian collection and Roman, Gallic, and Irish councils are used. King Henry I., in 1100, endeavored to repudiate a number of church laws and ordered that Peter's Pence was to be paid to the king instead of the Pope. Henry II. entered into a controversy over the enforcement of canon law with Thomas à Becket. In 1215, by the Magna Charta, King John confirmed to the prelates and barons of his kingdom the freedom of election of the clergy, and this acted as a general acknowledgment of ecclesiastical rights and liberties. In 1230, Otho, the legate of Pope Gregory IX., held a national synod, and in 1268 Othobon, the legate of Pope Clement IV., held a second, both of which, as Blackstone says, had a great effect on the ecclesiastical jurisprudence of England. Under King Henry III., Boniface, archbishop of Canterbury, enacted several canons which seemed against the existing laws of the realm, and under Stephen an ecclesiastical and a secular party were formed, the latter adhering to the common law as tenaciously as the clergy and nobility did to the canon and civil law. In the parliament of Merton, however, the adherents of the canon and civil law were defeated on the proposition to make *legitimatio per subsequens matrimonium* legal also in England as it was under canon and civil law. Under Richard II., more than 100 years later, the feud still existed. Anglo-canon law was further augmented by the decrees of provincial councils held under the archbishops of Canterbury, from Stephen Langton to Henry Chichiley, which were glossed by William Lindwood, and later enforced also by the archbishops of York. The kings meantime had also enacted many statutes on the relations between secular and ecclesiastical jurisdiction. A statute of Henry VIII. rendered void all canons which were contrary to the law of the realm or hurtful to the royal prerogatives, and provided a commission to revise them. Edward VI. renewed the commission, but the code was not confirmed before his death. Mary repealed all these acts, but Elizabeth revived the first act of Henry VIII. In 1603 some canons were made in the convocation of the province of Canterbury and confirmed by the king but not by Parliament. It is held that, therefore, these bind the clergy in church matters, but not the laity, except in so far as not repugnant to the laws of the realm. By acts of Parliament (26 Henry VIII., 1; 35 Henry VIII., 3; 1 Elizabeth, 1) the king was declared the supreme head of

the Church, and it became treason (1 Ed. VI., 12; 5 Eliz., 1) to doubt it or to defend the supremacy of the Pope as head of the Church. These acts and subsequent ones reversed canon law in England, Ireland, and Scotland. Speaking of the courts of the archbishops and bishops of the English Church to-day, Blackstone says: "An appeal lies from all these courts to the sovereign in the last resort, which proves that the jurisdiction exercised in them is derived from the crown of England. . . . It appears beyond a doubt that the civil and canon laws, though admitted in some cases by custom in some courts, are only subordinate and *leges sub graviori lege*. They are by no means with us a distinct, independent species of law, but are inferior branches of the customary or unwritten laws of England." In Scotland many of the provisions of canon law became the law of the land. During the 16th and 17th centuries canon law was taught in the Scottish universities, and from very early times many of the youths of Scotland attended the schools of the Continent, whence not a few returned as doctors *in utroque jure*, that is, canon and civil law. The canons of provincial councils, held yearly, and at whose meetings representatives of the king were present, constituted a national canon law which was recognized by the Pope and by Parliament and enforced in the courts of law. Even to this day, though the ecclesiastical system of the country is Presbyterian, the old canon law still prevails to a certain extent. "So deep hath this canon law been rooted," says Lord Stair in his 'Institutes of the Law of Scotland,' "that even where the Pope's authority is rejected yet consideration must be had to these laws, not only as those by which the Church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws which, because of their weighty matter and their once being received, may more fitly be retained than rejected." In two old acts of the Scotch Parliament, made in 1540 and 1551, the canon and Roman law are mentioned as the common law of the country, the clause used being "the common law, baith canon, civil and statutes of the realme." Since the restoration of the Catholic hierarchy in England in 1850, and in Scotland in 1878, the churches under Roman jurisdiction have held various councils and enacted laws to fit the changed conditions. These laws, having been examined by the committee of cardinals in Rome appointed for such purpose, have become, as it were, a national canon law for the Catholics of those countries. In a similar way the Catholics of newly established nations, owing to various reasons, are ruled by a modified canon law which gives the bishops and superiors a very extensive authority. Such is the case at present in Canada, Australia, and the United States. These modifications pertain chiefly to the election of bishops, the appointment and removal of parish clergy, the tenure and administration of church property. The second and third plenary councils of Baltimore contain special modifications for the United States. For Canada a preparatory meeting for a plenary council was held in 1903 under the presidency of the apostolic delegate. For Mexico, West Indies, and South America a council was held in Rome of the bishops of those countries, and its decrees were published in 1901. Other national modifications of canon law in the course of time have been introduced by concordats made by the Pope with the rulers of Christian nations by which he grants them certain concessions. As a nation Spain enjoys the greatest concessions, France up to the present coming next. The councils held in Gaul in the 4th and following centuries show the beginning of a national canon law for France. The fourth canon of the Council of Arles, convoked by King Clovis in 511, prohibited certain laymen and teachers from receiving holy orders without the king's consent. The Council of Orleans, in 549, shows that at that time the king's consent was necessary for the election of bishops. Many points regarding a special liturgy, the administration of the sacraments, the matter and forms of ecclesiastical trials are to be found in these same early councils. The laws of Dagobert, in 620, show special protection given the Church but also lay the foundation for future subjection; for councils could not be held without consent of the king, and bishops were elected not unfrequently at the dictation of royalty. But the capitularies of Charlemagne and his successors, collected in 825 by the abbot Ansegiso, were very favorable to the Church. Under the third dynasty, especially because of the feudal law, bishops, abbots, and chapters exercised almost complete civil authority over the people in their charge; but the oath of fealty was imposed on the prelates as vassals of the king. On the other hand, the kings took upon themselves the defense and guardianship of the Church, and on the pretext that at the death of the prelate they were the guardians of the vacant see, they performed many acts of ecclesiastical jurisdiction, among which was the administration of the temporalities of the vacant church. This was not done, however, without the assent of the sovereign pontiffs. Herein is found the origin of *jus Regaliæ* which later caused such trouble. In the year 1268 a pragmatic sanction was issued by Saint Louis which gave liberty of election of bishops and ordered that the general canon law should be observed throughout France. However, the genuineness of this law has been seriously questioned. Under Philip the Fair the seeds of absolute independence of the secular from the spiritual authority were sown; and about the same time serious contests arose between clerical and lay judges concerning their jurisdiction. On appeal to the king the clergy won; but the jurisdiction of the Church was gradually lessened, and at this time the appeal "as from abuse" was introduced, that is, a clergyman might appeal to the king from an abuse of the power exercised by a bishop. This was diametrically opposed to general canon law. The great schism of the West brought out the question whether the Pope or an ecumenical council was superior, and the controversy became especially bitter in France. Charles VII. selected certain passages from the Conciliabule of Basle, and in 1438 issued a pragmatic sanction in which the superiority of the council over the pope was declared, and elections both to episcopal sees and in monasteries were to be held after the ancient law of France. Louis XI. suppressed this decree, but it was revived after his death until finally condemned by the Fifth Lateran Council, and changed by

the concordat made between Leo X. and Francis I. In this concordat many of the dispositions of the pragmatic were preserved; but the concordat differed from the pragmatic in this: that in place of the election of bishops and prelates in case of vacancy the king was given the right to present to the sovereign pontiff, within six months, a doctor or licentiate in theology who should be at least 27 years of age and otherwise competent. The pontiff would grant institution. The parliament, after a long contest, agreed to the execution of this concordat. Herein is seen the beginning of the system of government nomination of bishops, concerning which, in 1903–4, the Pope and the French government were at variance. In the 16th century the government long opposed the publication of the decrees of the Council of Trent, but finally, without mentioning the source, the chief decrees, word for word, were published in 1579 by royal order. In 1681 the Gallican clergy, at the instance of the government, met in extraordinary convention and adopted a declaration favoring the extension of the *Regalia* to all France. This was repudiated by Pope Innocent XI. The next year the Gallican clergy adopted four propositions in which they attacked the Holy See in administrating temporal matters, and declared that the judgment of the Pope on a matter of faith was not irreformable except when the consent of the Church had been added. The king ordered the observance of this declaration, but it was condemned by Alexander VIII. Later, King Louis XIV. wrote the Pope that he had ordered that the decree should not be observed. Nevertheless, the *Regalia* was observed up to 1789 throughout all France, and the government continued taking the revenues of all vacant bishoprics and appointing to benefices during the interregnum. In an edict of 1695 a code of ecclesiastical law as observed in France was enacted, and in it was the appeal "as from an abuse," that is, from the ecclesiastical to the civil authorities. The national convention in 1790 passed a civil constitution for the clergy by which dioceses and parishes were suppressed and the Church made subject to the state. In 1801 Napoleon, as first consul, and Pope Pius VII. made a concordat in which the Catholic Church was acknowledged as the state Church, and by which new limits were assigned to dioceses and parishes, and by which especially the right of nominating bishops was given to the ruler of France. To the nominees the Pope would grant institution. Various other regulations were made, and the French government took upon itself the support of the bishops and parish priests in place of restoring the immense church properties which had been confiscated. During the year 1904 a great agitation occurred for the suppression of this concordat because of controversies over some bishops held delinquent and suspended by the Pope. With the abrogation of the concordat the state will not longer support the clergy, nor can it nominate to bishoprics. During the 19th century the liturgical worship of the Church in France was made conformable to that of Rome, and other matters of discipline were brought under general canon law.

Undoubtedly canon law has exerted a wide and lasting influence on the nations of Europe and America. It made them Christian states and directly or indirectly modified their constitutions. State legislative assemblies based their proceedings on the methods of Church councils. The law of nations is simply the application to nations of the principles of Christian law taught to individuals. The ancient Romans as well as barbarous tribes considered all foreigners enemies; the Church taught the brotherhood of all men. The Pope, as the common father of all Christians, acted as arbitrator in the disputes between nations, and so noteworthy became the Roman Rota, to which the Pope referred international disputes, that at times much of its work was deciding important questions for rulers of nations. The system of Church administration served as a model for that of states, and the clergy, especially in the earlier and Middle Ages, being the educated class and following canon law, naturally introduced many of its rules into everyday life. The elevated condition of woman is due to the canon law prescriptions regarding marriage, which the Church enforced on all nations converted to Christianity. Questions relating to widows and orphans were within the jurisdiction of canon law and Church courts. The incorporation of Church bodies, from which other corporations took their origin, had its foundation in the law of Justinian and was imported into England with the civil and canon law. As in the Roman law, the charter of the sovereign is always expressed, or at least implied. From England the idea of corporation and corporation sole came into American law. The writ of habeas corpus had its origin in the Roman law "*interdictum de libero homine exhibendo.*" Inheritance by will and the rule for the descent of real property came from Roman law, while trial by jury, with challenges of the jurymen, was determined in the Roman Lex Servilia and Lex Cornelia. While in England "Christianity is part of the law of the land," in the United States this "is true only in a qualified sense" (33 Barber 548), and owing only to "the fact that it is a Christian country and that its constitution and laws are made by a Christian people" (23 Ohio St. 211). Nevertheless "the decision of ecclesiastical courts or officers having, by the rules or laws of the bodies to which they belong, jurisdiction of such questions, or the right to decide them, will be held conclusive in all courts of civil administration, and no question involved in such decisions will be revised or reviewed in the civil courts, except those pertaining to the jurisdiction of such courts or officers to determine such questions according to the laws or usage of the bodies which they represent." (Quoted with approval in 98 Penn. 213.) "Civil courts will not review the action of ecclesiastical tribunals except where rights of property are involved" (62 Iowa 567; 23 Ill. 456). Justice Strong, in 'Relations of Civil Law to Church Policy,' concludes: "I think it may be safely asserted, as a general proposition, that whenever questions of discipline, of faith, of church rule, of membership, or of office have been decided by the Church in its own modes of decision, civil law tribunals accept the decisions as final and apply them as made." See also LAW; CATHOLIC CHURCH, ROMAN.

P. A. BAART, S.T.L., LL.D.,
Author of 'Church and State in the United States of America,' 'The Roman Court,' 'Legal Formulary,' 'Tenure of Church Property in the United States,' etc.

Canon of the Mass, that part of the mass following the sanctus. The rule of the Roman Catholic Church for celebrating the Eucharist is contained in this canon.

Canon of Scripture. See CANON; BIBLE.

Can'oness. At the close of the 8th century the title of canoness was given to a class of women who took the vows of chastity and obedience, but not that of poverty, and were not cloistered, though they had a common table and dormitory, and were bound to the recitation of the breviary, as were nuns. They derived their name from their being enrolled in the canon or official list of the church. Their occupations were chiefly education of girls, transcription and embellishment of church office-books, and embroidery of vestments. The advantages of such institutions as asylums in a rough age were soon visible, and they multiplied in consequence, but as in many houses the religious motive had little to do with entrance, a distinction was drawn ere long between canonesses regular and secular. The secular canonesses were for the most part members of princely or noble families, practised much state and luxury, and retained none of the rule save the common dormitory and the recitation of the Hours in choir. In Germany, several abbesses of canonesses were princesses of the empire, kept up feudal state, and furnished contingents to the imperial army from their vassals; and at the Reformation some chapters adopted the new opinions, and subsist to the present day as Protestant foundations, enjoying the revenues, and admitting to membership only ladies of noble birth or daughters of distinguished members of the military and civil services, whose sole obligation is celibacy during membership. The institute never spread beyond the limits of the empire, and the non-German houses were chiefly in Hainault, Flanders, and Lorraine.

Can'ongate, The, the principal street in the Old Town of Edinburgh. It is upward of one mile in length, rising gradually with a regular and steep incline from a small plain at the east end of the town, on which stands the palace of Holyrood, and terminating at the castle. The appearance of this street, the scene of many interesting historical incidents, is rendered remarkable by the loftiness and antique aspect of the houses with which it is lined, most of them ranging from five to seven stories in front, and often more behind. At different points it is known by other names, High Street, Lawnmarket, etc.

Canon'ical Books, the books of Scripture belonging to the canon. See CANON; BIBLE.

Canonical Hours, certain times of the day set apart by ecclesiastical law in the Roman Catholic Church to the offices of prayer and devotion, namely, matins with lauds, prime, tierce, sext, nones, even-song or vespers, and compline. The day was divided into seven parts and the observance of the canonical hours was as follows: prime, tierce, sext and nones at the first, third, sixth and ninth hours of the day, counting from six in the morning; vespers at the eleventh hour, compline at midnight and matins shortly after midnight. These times are no longer strictly adhered to. In England the canonical hours are from eight to twelve in the forenoon, before or after which the marriage service cannot be legally performed in any parish church.

Canonicals, the prescribed dress or vestments worn by the clergy of the Roman Catholic, Protestant Episcopal, and other churches when officiating at religious services. The wearing of vestments is of ancient origin. In all the pagan religions the priests wear symbolic garments, and in the Jewish system the priestly robes were very elaborate and significant. The modern Jewish system retains these ecclesiastical vestments and the ministers of many Protestant denominations wear such attire. See CHASUBLE; STOLE, etc.

Canon'icus, Indian chief: b. about 1565; d. 4 June 1647. When the Pilgrims landed, he and his nephew Miantonomo (q.v.) were associate sachems of the fierce Narragansetts, mustering some 3,000 warriors. In the winter of 1621–2 he sent to the little colony, with about 50 fighting men, a bundle of arrows bound with a snakeskin, either as a preliminary of war or a demand of gifts to avert it. They returned the skin stuffed with powder and ball, and the frightened savages did not dare keep it, but saw that it got back to the colony. A lasting treaty was negotiated, and it was partly owing to the influence of Canonicus that the tribe never made war against the English, even many years after his death, till "King Philip's War" of 1675. In 1636 the septuagenarian chief was succeeded as head sachem by Miantonomo, but still retained the prestige of age and experience. In that year Roger Williams and his company, who had first sought refuge from the Massachusetts authorities among the Pokanokets, thought it best to go farther, and applied to the Narragansetts. They were kindly received, and to them was granted the peninsula where Providence stands. According to Williams, Canonicus was always most friendly and helpful till his death. In 1637 the Pequots of Connecticut were attempting to form a general Indian league to exterminate the English settlements, and the Massachusetts government sent an embassy to prevent the Narragansetts from joining it. Canonicus received them with great Indian pomp in his wigwam of poles and mats, surrounded by his "mugwumps" and leading warriors, gave them a feast with boiled chestnuts and huckleberry Indian pudding for dessert; and probably more from kind regard for Williams than through the embassy's persuasions — kept the peace, and even furnished a couple of hundred warriors to help the English. These allies, however, played the usual ambiguous Indian part, ready to massacre the beaten side. In 1644 the Gorton (q.v.) party succeeded in persuading the chiefs that it was under the protection of irresistible powers in England; and on 9 April Canonicus, his son Mixan, and his nephew Pessacus, brother and successor of Miantonimo, signed two astonishing documents, of whose purport it is very unlikely that they had been correctly informed. One of them ceded the land and people of the Narragansetts to his Majesty of Great Britain, placing the Indians themselves under his protection, and appointing Gorton and three others their attorneys to carry the instrument to him. The other, addressed to the Massachusetts authorities, was

the refusal of their invitation to visit Boston. It also menaced the authorities on account of Miantonimo's death, and threatened to revenge it on Uncas. Finally, however, a truce was signed, and three years later Canonicus died.

Canoniza'tion, a ceremony in the Roman Catholic Church, by which deceased persons are declared saints. Alexander III., in 1170, pronounced it an exclusive privilege of the papal chair. This ceremony is one of great solemnity. The Pope institutes a formal investigation of the qualifications of the deceased person recommended for canonization, in which his manner of life and the genuineness of the miracles ascribed to him are strictly examined; and a promoter of the faith, commonly called the devil's advocate, is appointed to assail the candidate's memory. If the examination is satisfactory, the Pope pronounces the beatification of the candidate. (See BEATIFICATION.) In order to collect new proofs of his merits (for example, of miracles performed by his relics), the actual canonization generally takes place many years afterward; and then a day, usually the anniversary of the death of the new saint, is dedicated to his honor, his name is inserted in the canon, that is the list or register, of the Saints (thence canonization), churches and altars are consecrated to him, and his remains are preserved as holy relics.

Canons, Book of, a system of canons or rules prepared for the Church of Scotland by its bishops, in accordance with the direction of Charles I. It was published in 1636, having undergone revision at the hands of Archbishop Laud. In Scotland its promulgation was felt to be arbitrary, and the strongest objections were made against it.

Canons of the Church of England, the «constitutions and canons ecclesiastical» drawn up in convocation in 1604 by the synod in London. These canons, still in force as revised, number 141, and were designed to confirm the established system of the Church of England, particularly through the test oath, aimed at the Puritan party, in which the clergy were sworn to subscribe willingly to the supremacy of the sovereign, to the Articles, and to the Prayer-book.

Canon's Yeoman's Tale, The, one of Chaucer's 'Canterbury Tales.' The narrator, the ill-treated guard and servant of a worthless canon, describes the manner in which alchemists, such as his master, contrive to dupe their victims.

Cano'pic Vases, or **Cano'pi,** certain large-bellied vessels found in tombs in Egypt, containing the embalmed intestines of bodies that had been converted into mummies. Four of these were placed in a tomb, each appropriated to a particular deity, and surmounted by the effigy of the head of such deity, as of a man, an ape, a jackal, or a hawk. It is to those with the human head that the term canopi has been more particularly applied. They were frequently made of basalt, and decorated with figures in relievo or paintings; or of costly white alabaster, with spiral flutings; or they were formed from black burned clay. The name is derived from the town Canopus.

Canoppi, Antonio, än-tō'nē-ō kä-nō'pē, Italian scene-painter: b. 1773; d. St. Petersburg, 1832. He received his first education from his father, who was employed as civil engineer by the Duke of Modena, and after occupying himself for some time with fresco-painting, was subsequently employed as scene-painter in Venice and Mantua. Compelled to resort to flight at the time of the French invasion, he first betook himself to Vienna and afterward to Moscow, where he was engaged in the decoration of many palaces, which, however, were burnt in the great fire of 1812. From that time until his death he was engaged as scene-painter of the imperial theatre of St. Petersburg. His most admired efforts in that branch of art were his architectural scenes for Mozart's 'Magic Flute,' and for 'Semiramis.'

Cano'pus, or **Cano'bus,** a bright star of the first magnitude, belonging to the southern constellation Argo, and invisible in the north or middle parts of the United States, on account of its nearness to the South Pole.

Cano'pus. 1. In Egyptian mythology, a water-god, represented on vessels of a spherical shape. These vessels were used by the ancient Egyptians to keep the water of the Nile in good drinking condition. The worship of Canopus was superseded under the first Ptolemy by that of Serapis — a Greek inscription in honor of Serapis at Canopus having been discovered by Mr. Hamilton amid the ruins of Alexandria. 2. In ancient geography, one of the most remarkable towns of lower Egypt, near the most western mouth of the Nile. The name of the town is variously ascribed to the divinity of the same name and to Canopus, or Canobus, the helmsman of Menelaus, who died in Egypt of the bite of a serpent, after his return from Troy, and who was buried on the site of the town. It was the seat of a temple of Serapis, whose oracle was celebrated, especially among the sick seeking for restoration to health. 3. In astronomy, the name of the brightest star except Sirius. It is in the constellation Argo.

Can'opy, a net of very ancient use, as in Greece and Egypt, for protection against mosquitoes, gnats, etc.; hence any net or hanging placed over a bed for like purpose; also such a hanging or a projection over a bed, a door, a window, an altar, a pulpit, throne, niche, tomb, or other architectural structure. Canopies are also borne over the heads of kings or other personages and over sacred objects in ceremonial processions.

Canosa (kä-nōs'sä) **Di Puglia,** Italy, a city in the province of Bari, 14 miles to the southwest of Barletta on the Adriatic. It was the ancient Canusium, and various relics of Roman times, including an amphitheatre, have been found. Between Barletta and Canosa was the ancient Cannæ (q.v.), where in 216 B.C. Hannibal defeated the Romans. Tombs cut in rock on a hill have been found in the neighborhood, and in 1813 a beautiful burial-chamber was opened, which contained the corpse of a warrior in armor. A copper lamp and a number of beautiful vases were also found here. The paintings upon the vases were the most important part of this discovery. They refer to the Greek-Italian mysteries. Pop. about 25,000.

Canossa, a ruined mountain castle of northern Italy, 12 miles southwest of Reggio. In the 11th century it belonged to Countess Matilda of Tuscany, with whom Pope Gregory VII. resided in 1077, when he imposed a severe

penance upon the excommunicated Emperor Henry IV. (q.v.). The phrase "to go to Canossa" has come to be proverbial for some humiliating surrender, withdrawal, or the like.

Canot, kä-nō', **Theodore,** Italian adventurer and slave trader: b. Florence, 1807; d. 1850. His father was a captain and paymaster in the French army; his mother a native of Piedmont. He made his first voyage in 1819, in the American ship Galatea, of Boston, from Leghorn to Calcutta. He visited Boston, sailed to various parts of the world, was shipwrecked near Ostend, and again on the coast of Cuba, where he fell into the hands of a gang of pirates, one of whom claimed to be his uncle, befriended him for some time, and finally sent him to an Italian grocer at Regla, near Havana, who was secretly concerned in the African slave trade. Canot made his first voyage to Africa in 1826, landing at the slave factory of Bangalang, on the Rio Pongo, Senegambia. After quelling a mutiny on board and helping to stow away 108 slaves under 15 years of age, in a hole 22 inches high, the young adventurer entered the service of the owner of the factory. He soon became a favorite with the native chiefs, whose proposals of matrimonial alliance were exceedingly embarrassing. He visited various parts of the neighboring country, improving every opportunity to study the workings of the trade in which he had determined to engage, and collecting by the aid of the African princes a stock of slaves for his newly established depot at Kambia near Bangalang. In May 1828 his factory and goods were destroyed by fire. He afterward purchased a vessel at Sierra Leone, in which with a cargo of slaves wrested from a trader in the Rio Nunez, he sailed to Cuba. Three more expeditions soon followed; in the first he lost 300 slaves by smallpox; in the last he was taken by the French and condemned to 10 years' confinement in the prison of Brest, in France, but after a year's durance was pardoned by Louis Philippe. Resolved still to pursue his dangerous occupation, he returned to Africa, and was the pioneer of the slave traffic at New Sestros. After meeting with various adventures here in his expeditions among the surrounding tribes, we hear of him in 1839 on a pleasure trip to England. He returned to New Sestros and in 1840 shipped to Cuba 749 slaves. He now resolved to abandon his illicit course, and obtaining from an African chief a valuable grant of land at Cape Mount, established there in 1841 a trading and farming settlement under the name of New Florence. In March 1847 New Florence was destroyed by the British, who suspected it to be a slave station, and Canot subsequently removed to South America, where he engaged in legitimate commerce. He resided for some time in Baltimore, Md., and finally received from Napoleon III. an office in one of the French colonies in Oceanica. Consult Mayer, 'Captain Canot, or Twenty Years of an African Slaver' (1854).

Canova, Antonio, än-tō'nē-ō kä-nō'vä, Italian sculptor: b. Possagno, Venetia, 1 Nov. 1757; d. Venice, 13 Oct. 1822. Canova may be considered as the restorer of the graceful and lovely style, and the founder of a new school, as far as it respects softness and delicacy of execution, and excellent handling of the marble. He was sent as an apprentice to Bassano, where he acquired skill in the mechanical part of the art. His first work, executed in his 17th year, was an Eurydice in soft marble, of half the natural size. He was now sent to the Academy of Venice, where his proper study commenced. He gained several prizes, and excited expectations which he more than equalled in the sequel. The first work which he was commissioned to execute was the statue of the Marchese Poleni, of the natural size, for the city of Padua. In his 25th year he finished the group of Dædalus and Icarus, of the natural size, in Carrara marble, a remarkable juvenile work. The senate of Venice sent him, in 1779, to Rome, with a salary of 300 ducats. A group as large as life — 'Theseus Sitting upon the Slain Minotaur' — was the first large work by which Canova made himself known in Rome (1783). In 1783 he undertook the execution of the tomb of Pope Clement XIV., in the church Degli Apostoli. He retained the usual style of composition, and only improved on the depraved taste of the school of Bernini. He next executed the group of 'Cupid and Psyche,' where he first displayed his own peculiar style, of which loveliness is a striking characteristic. The figures are exceedingly delicate and graceful. He was employed on a second public monument, the tomb of Pope Clement XIII., in St. Peter's. It was finished in 1792, and is distinguished by its colossal size and simple style. Meanwhile the fame of the artist continually increased. He established in the palace of the Venetian ambassador a school for the benefit of young Venetians. His next works were a winged Cupid, standing; another group of 'Cupid and Psyche'; a group of 'Venus and Adonis' for the Marchese Verio, in Naples; the tomb of the Venetian Admiral Emo, for the Republic of Venice. This is a combination of bas-reliefs with figures in full relief. Canova also produced a very lovely 'Psyche,' standing, half-dressed, with a butterfly in her left hand, which she holds by the wings with her right, and contemplates, with a calm, smiling mien. A 'Repentant Magdalene,' of the natural size, belongs to the works in marble in which he has carried the expression of the melting and the soft to the highest degree. His 'Hebe' is a delightful figure. In an easy and animated attitude the smiling goddess of youth hovers upon a cloud, pouring nectar with her right hand into a bowl which she holds in her left. Both vessels, as well as the coronet of Hebe and the edges of her garment, are gilt. Canova is fond of a variety of material, and often endeavors to give to his statues the effect of pictures. He next displayed his talent for the tragical in the raging 'Hercules Hurling Lichas into the Sea.' The group is colossal, and Hercules somewhat larger than the Farnesian; but it makes a disagreeable impression, which proves that the genius of Canova was not adapted to such subjects. His representation of the two pugilists, 'Kreugas and Demoxenos,' is much more successful. A standing group of 'Cupid and Psyche' was the triumph of his art. Psyche here appears again holding the butterfly. In 1796 and 1797 Canova finished the model of the celebrated tomb of the Archduchess Christina of Austria, wife of Duke Albert of Saxe-Teschen, which in 1805 was placed in the church of the Augustines at Vienna. In 1797 he made the colossal model of a statue of the king of

Naples, one of his finest works. This statue, 15 palms high, was executed in marble in 1803. During the revolution of 1798 and 1799 Canova accompanied the senator prince, Rezzonico, on a journey through Germany. After his return he remained for some time in the Venetian territory, and painted for the church of his native village an altar-piece, in which are represented the dead Christ, the Maries, Nicodemus, and Joseph, and, on high, God the Father. He afterward executed in Rome his 'Perseus with the Head of Medusa,' which, when the Apollo of Belvidere was carried to France, occupied its place and pedestal. This statue increased the fame of Canova more than any of the preceding works. But Perseus is only an imitation of the Apollo. The separate parts are of exquisite beauty in form as well as in masterly, delicate finishing. In 1802 he was invited by Bonaparte to Paris to make the model of his colossal statue. In the beginning of 1803 the model of the emperor's bust, and afterward that of his statue, was to be seen in the workshop of the artist. There is not a more successful work of the kind than this bust: the figure of the statue is not so good. Among the later works of the artist are a Washington, of colossal size, in a sitting attitude; the tombs of the Cardinal of York and of Pius VII.; an imitation of the Medicean Venus; a 'Venus Rising from the Bath'; the colossal group of 'Theseus killing the Minotaur,' far surpassing his earlier works in the heroic style; the tomb of Alfieri, for the Countess of Stolberg, in Florence, and erected in that place (the 'Weeping Italia,' a colossal statue in marble, is particularly admired); the 'Graces Rising from the Bath'; the monument of the Marchioness of S. Croce; a 'Venus'; a 'Dancing Girl,' with almost transparent garments; a colossal 'Hector'; a 'Paris'; a 'Muse,' larger than the natural size; a model of a colossal 'Ajax'; and the model of a sitting statue, in rich robes, of the Archduchess Maria Louisa of Austria. After the second fall of Napoleon, in 1815, Canova was commissioned by the Pope to demand the restoration of the works of art carried from Rome; went from Paris to London, and returned to Rome in 1816, where Pius VII. inscribed his name in the golden book of the capitol, declared him "to have deserved well of the city of Rome," and made him Marquis of Ischia, with a pension of 3,000 scudi.

As a man Canova was active, open, mild, obliging, and kind toward everybody. His opinion of himself was very modest, notwithstanding his fame was spread through all Europe. He assisted promising young artists, and established prizes for the encouragement of the arts. When the Pope conferred upon him the title of Marquis of Ischia, with a pension, he dedicated the whole of the latter to the support and encouragement of poor and deserving artists. Canova was also an agreeable painter, but, strangely enough, more of a colorist than a correct designer. See lives of Canova by Ciognara (1823); Missirini, (1824); the biographies of Rosini (1825); D'Este (1864). Engraved representations of all his works have appeared in Italy and at Paris.

Canovaï, Stanislao, stän-īs-lä'ō kä-nō-vä'ē, Italian ecclesiastic and historian: b. Florence, 27 March 1740; d. there, 17 Nov. 1811. Having taken holy orders, he officiated afterward as professor of mathematics at Parma. In 1788, as a member of the academy of antiquities, he contended for the prize which was offered for an essay on Americus Vespucius. He opposed the common opinion that Columbus was the first discoverer of the new world, claiming that Vespucius one year before him had touched upon the northern part of the continent and had landed in Brazil. His paper gained the prize, but produced much discussion.

Canovas del Castillo, Antonio, än-tō'nē-ō kä'nō väs děl käs tēl'yō, Spanish statesman and man of letters: b. Malaga, 8 Feb. 1828; d. Santa Aquedo, 8 Aug. 1897. He was editor of the Conservative journal, 'Patria,' and in 1854 entered the public service as member of the Cortes; thereafter he held various posts in the government. At his death he had been for two years prime minister, and had held the same position three times previously. He is author of 'Literary Studies' (1868); 'History of the Austrian Dominion in Spain' (1869); 'Problems of the Time' (2 vols. 1884); 'Studies on the Reign of Philip IV.' (3 vols. 1888–90). He was editor-in-chief of a 'General History of Spain,' consisting of monographs by sundry writers (1890–7). He was assassinated at the baths of Santa Aqueda. See Pons y Humbert, 'Canovas del Castillo' (1901).

Canrobert, François Certain, fräṅ swä sĕr-tăṅ käṅ-rō-bār, marshal of France: b. St. Cere in Lot, 27 June 1809; d. Paris, 28 Jan. 1895. He was educated in the military academy of St. Cyr, and in 1828 entered the army. He had seen nearly 20 years' brilliant service in Algeria, and had actively supported the future emperor at the *coup d'état* of 1851, when he received the rank of a general of division in 1853. As such he commanded the first division of the French army under Marshal St. Arnaud, sent to the Crimea in 1854; and at the battle of the Alma was wounded in the breast and hand by the splinter of a shell. On St. Arnaud's death, nine days later, Canrobert assumed the chief command of the French army. According to the historian Kinglake, he deliberately retarded the progress of operations, let slip many opportunities, and hampered the English — his object being to forward Napoleon's design of coming out to head a final and victorious campaign. In the war in Italy against the Austrians (1859) Canrobert had the command of the third division of the French army, and at the battles of Magenta and Solferino his *corps d'armée* was engaged. In the Franco-German war of 1870 he was shut up in Metz with Bazaine, and became a prisoner in Germany. He was an ardent Imperialist till the death of the Prince Imperial (1879). In 1876 he became a member of the Senate. See Martin, 'Le Maréchal Canrobert.'

Can'so, Gut or **Strait of,** a narrow strait or channel, about 17 miles long and 2½ miles in width, separating Nova Scotia from Cape Breton island. It is navigable by the largest ships, and its scenery is very beautiful.

Canstadt, kän'stät, the name given, from Cannstatt or Canstadt, Germany, to the dolichocephalic or long-headed man of the Quaternary age, whose existence was inferred from a piece of skull found near there in 1700.

Canstein, Karl Hildebrand von, kärl hĭl'dē-brănt fŏn kän'stīn, German founder of a famous establishment for printing Bibles: b. Lindenberg, 1667; d. 1719. He studied at Frankfort-on-the-Oder, traveled much in Europe, went in 1688 to Berlin, where he was appointed page of the Elector of Brandenburg, and served as a volunteer in the Netherlands. A dangerous sickness obliged him to leave the military service. He went to Halle, where he became familiarly acquainted with Spener and Francke, and became eager to spread a knowledge of religion among the common people. He was especially anxious that the poor should have Bibles at as low rate as possible, and thus originated the famous institution, called the Canstein Bible Institution, which after the death of Canstein in 1719 became associated with the institutions founded by Francke, and still continues its benevolent operations.

Cant-timbers, in ship-building, those timbers which are situated at the ends of a ship. They derive their name from being *canted,* or raised obliquely from the keel, in contradistinction from those the planes of which are perpendicular to it.

Cantabile, kän-tä'bĭ-lā, in music, a term applied to movements intended to be performed in a graceful, elegant, and melodious style.

Cantabri, kän-tā'brē, the rudest and most valiant of all the Iberian tribes, who dwelt in the ancient Hispania Tarraconensis, and inhabited the greater part of what is now La Montana and the northwest part of the present province Burgos. In ancient history Cantabri is generally used to denote all the inhabitants of the northern mountains of Spain. Cantabria is the name which was given to the country they inhabited. Oceanus Cantabricus is the ancient name of the Bay of Biscay. Cantabrian Mountains is the general name of the various mountain ranges extending from the western Pyrenees along the north coast of Spain to Cape Finisterre. The highest of the ranges, the Sierra d'Aralar, attains an altitude of 7,032 feet. These mountains are imperfectly known, but in parts they are covered with magnificent forests, and from those of Santander the snow never entirely disappears.

Canta'bria. See CANTABRI.

Canta'brian Mountains, the general name of the various mountain ranges extending from the western Pyrenees along the north coast of Spain to Cape Finisterre. They attain in some parts a height of about 9,000 feet, and are rich in minerals, especially copper, lead, iron, and gold. Large forests of oak, chestnuts, and other trees are also found on their slopes.

Cantacuzenus, kän-tā-koo-zā'noos, **John,** Byzantine emperor and historian: b. about 1300; d. about 1383. While minister of Andronicus III. he negotiated a favorable peace with the Genoese in 1336, and repelled the encroachments of the Turks in 1337. On the death of Andronicus in 1341 Cantacuzenus became regent during the minority of the young emperor, John Palæologus. He defeated the Bulgarians and Turks, assumed the diadem, and entered Constantinople, victorious over his rivals, in 1346. He used his power with moderation, and endeavored to heal the wounds which five years of civil war had inflicted on the state; but religious disputes, civil dissensions, and foreign enemies soon disturbed his government; and the jealousy of Palæologus, the rebellion of his own son, war, plague, the frightful disorders which prevailed in the empire, and his own loss of popular favor, induced him to renounce the crown. He retired to a monastery (1355), where he employed himself in literary labors. He is considered one of the greatest among the successors of Constantine. His 'Four Books of Byzantine History' were printed in 1645, and belong to the collection of the Byzantine historians. His other works, principally theological, are partly printed and partly in manuscript.

Cantal, käñ tăl, France, a central department, area, 2,217 square miles; capital, Aurillac. It is named from its highest mountain, the Plomb du Cantal, Mons Celtorum of the ancients, which rises to the height of 6,094 feet. The department is one of the poorest and least productive districts of France. The climate is rather severe near the mountains. Agriculture is in a backward state. The principal crops are rye, buckwheat, potatoes, and chestnuts, and some hemp and flax. Of wheat and oats the product is insufficient for the consumption. Cattle, sheep, horses, and mules are raised in large numbers; and on the refuse of the dairies numerous pigs are fed. The fat cattle from this department are much esteemed, and are sent to all parts of the country. Large quantities of cheese are made, and sold principally in the south of France under the name of Auvergne cheeses. The minerals, as a whole, are unimportant. Hot mineral springs are abundant, those of Chaudes-Aigues being the most frequented. The manufactures are of trifling importance. Cantal is divided into four arrondissements, containing 23 cantons and 267 communes. Pop. (1901) 218,941.

Can'taloupe, a small round variety of musk-melon, globular, ribbed, of pale-green or yellow color and of delicate flavor; first grown in Europe at Cantalupo, in Italy. See MUSK-MELON.

Cantalupo, kän-tä-loo'pō, Italy, a town of Naples, province of Sannio or Molise, memorable for a French victory over the Neapolitans in 1798, and for a destructive earthquake, in which many lives were lost, in 1805.

Cantani, Arnoldo, Italian physician: b. Hainsbach, Bohemia, 15 Feb. 1837; d. Naples, 7 May 1893. He was educated at Prague, and was physician in the general hospital there. In 1864 he became professor of pharmacology and toxicology at Pavia; in 1867 he was director of the clinical institute at Milan, and in 1868 of that at Naples. In 1889 he became a senator of Italy. He investigated chiefly malaria, typhus, and tuberculosis; and was influential in introducing the methods of German medicine into Italy. He wrote 'Manuale di Materia Medica e Terapeutica' (1865); 'Manuale di Farmacologia Clinica' (1885–90).

Cantarini, Simone, sē mō nā kän-tä-rē'nē, also known as IL PESARESE, Italian painter: b. Pesaro, 1612; d. Verona, 1648. He studied under Guido Reni at Bologna, where he afterward painted a large number of pictures, all much in the style, but without the grace and delicacy, of his master's work. His 37 etchings

more closely resemble those of Guido. Throughout his life Cantarini's intolerable arrogance made him numerous enemies; and after a quarrel with his chief patron, the Duke of Mantua, he died in Verona. Among his best-known paintings are an 'Assumption'; 'A Holy Family'; and 'Joseph and Potiphar's Wife.'

Canta'ro, kăn-tä'rō, a measure of weight and capacity. As a measure of weight it equals in Turkey 124.7 pounds, in Egypt 98 pounds, in Malta 175 pounds, etc. The Turkish cantar as a measure of capacity equals about 31.5 gallons. The Spanish wine-measure cantaro is about three and a half gallons.

Cantata, kăn-tä'ta, in music, a species of vocal composition, consisting of an intermixture of air, recitative, duet, trio, quartette, and chorus. According to some, it was invented by Carissimi about the middle of the 17th century. By others its invention has been ascribed to Barbara Strozzi, a Venetian lady, in the 18th century. The subject may be sacred, pastoral, or amatory, and in the hands of some composers it takes the dimensions of a short oratorio or opera, but without acting. Mozart, Beethoven, Mendelssohn, and other great musicians have composed cantatas, and among English composers we may mention Purcell, Sterndale Bennett, Macfarren, and Henry Smart.

Canteen, in the United States army, (1) a soldier's tin flask, containing two to three pints, and covered with a woven fabric; (2) a co-operative store, at a camp or garrison, where spirituous liquors are on sale under certain regulations. In British use thē canteen is not a refreshment-bottle, but a sort of combination pan, dish, and plate, for use at mess. The departments of the British garrison store are usually divided into a dry canteen and wet canteen, the former being for general groceries and provisions, and the latter for liquid refreshment, excluding spirituous liquors.

Previous to 1901, beer and wine were allowed to be sold at the canteens in the United States army, though spirits were prohibited. In that year an anti-canteen law went into effect, as the result of temperance agitation. There has been wide discussion as to the merits and demerits of this law. The National Anti-Saloon League, at its annual session in Washington, in December 1902, adopted an address containing an argument favoring the law, as follows:

"The official reports of courts-martial show that the trials per 1,000 men more than doubled during the last three years of the canteen liquor-selling law, increasing from 52 per 1,000 men in 1898 to 100 in 1900, and that since the year 1900 (in which is included six months of the canteen liquor-selling and eighteen months of non-selling), the courts-martial have decreased to 61—that is, have decreased 39 per 1,000 men. The reports of the surgeon-general of the army show a marked decrease of disease . . . about 25 per cent. The same reports show a startling decrease in insanity of about 33 per cent."

During the time of the League's agitation the 'Army and Navy Journal' gave editorial utterance to the following, voicing another view of the situation:

"The adjutant-general of the army, in his annual report, states that since the canteen was abolished intoxication and offenses due to intoxication have greatly increased, and he declares it as his serious opinion that the increase of desertions and of trials for infractions of discipline is due in large degree 'to the abolition of the former privileges of the exchange.' The belief, which appears to be seriously entertained in some quarters, that the closing of the canteens has lead to a decreased consumption of liquor by the soldiers is ludicrous to the last degree. It is flatly refuted by a few simple facts. Immediately adjacent to the various posts of the army there are nearly 1,500 saloons, most of them dens of vice, where the liquor dispensed is of the vilest quality. The number of these places was increased by nearly 300 during the last fiscal year. . . . The nearly universal opinion appears to be that the abolition of the canteen was a mistake, and that its restoration would be a step in the direction of temperance and good order."

The United States Congress in 1902 appropriated $500,000 to build and maintain suitable buildings at army posts, for the recreation and sociability of the men, and also increased the rations five cents per day, to enable them to procure more delicacies without depending upon the profits of a liquor-selling canteen. When these buildings come into general use, and statistics can be had for a longer period, it will be possible to form a more accurate opinion as to the wisdom of abolishing the canteen.

Canterbury, England, cathedral city, and parliamentary, municipal, and county borough in Kent, 55 miles southeast of London, on the river Stour. It is supposed to have been a place of importance before the Roman invasion, the Roman name *Durovernum* showing apparently the British prefix *Dwr,* water, although antiquaries differ as to the remainder of the compound. Druidical remains have been found here, together with the British weapons termed celts. Its importance under the Roman dominion is proved by many circumstances; and especially by the discovery of a great variety of remains of that people; added to which, Roman bricks have been found in certain portions of the remaining walls. It derives its present name from the Saxon *Cant-wara-byrig,* the Kentishmen's city. During the residence of Ethelbert, king of Kent, the memorable arrival of St. Augustin took place in 596; an event rapidly followed by the conversion of this king and his people to Christianity; and the foundation of the archiepiscopal see of Canterbury. In the 8th and the three following centuries, the city was dreadfully ravaged by the Danes, and on one occasion, in 1011, nearly the whole of the inhabitants, including women, children, and the archbishop himself, were barbarously massacred, and the cathedral burned to its bared walls. It gradually, however, recovered, and at the Conquest its buildings exceeded in extent those of London. The ecclesiastical importance of the place, in particular, advanced with great rapidity, which was consummated by the murder of Thomas à Becket, whose canonization by the Pope rendered Canterbury the resort of pilgrims from every part of Europe. Not only were the priory and see benefited by the offerings of the rich devotees, but the prosperity of the town itself was greatly advanced by the money spent in it by so many wealthy strangers. Erasmus describes the church, and especially the chapel in which he was interred, as glittering with the gold and jewels offered up by the princes, nobles, and wealthy visitors of his shrine; all of which Henry VIII. appropriated to himself on the dissolution of the priory in 1539, when he ordered the bones of Becket to be burned to ashes. Several of the English monarchs have made a temporary residence at Canterbury, which was also occupied by Oliver Cromwell in the civil wars, whose troopers made a stable of the cathedral.

Canterbury is beautifully situated in a fertile vale, surrounded by gentle eminences, which supply numerous streams of excellent water. The principal thoroughfare is wide, the houses well built, and the streets in general well paved and lighted. It extends about half a mile east to west, and rather more north to south, with four suburbs at the four cardinal points. From all points Canterbury presents a picturesque appearance, its antique features contrasting finely with the sylvan scenery around. The most remarkable object in the city is the cathedral, one of the finest ecclesiastical structures in England. The original building, of which no part now remains, was of great antiquity, the distinction having been claimed for it of being the first Christian church in the kingdom. The present edifice, 530 feet in length, east to west, and 154 in breadth, has been built in different ages (the oldest part dating from the 11th century), and presents in consequence various styles of architecture (including the Norman and Early English), but retains altogether an imposing appearance. The great tower, 235 feet in height, is one of the most beautiful specimens of the Perpendicular style of Gothic; and the choir is also very fine. St. Augustine's monastery, restored and enlarged, is now a church missionary college. St. Margaret's Church has been restored in excellent taste; and the church dedicated to St. Martin, on a hill in the eastern quarter of the city, is believed to be one of the oldest existing Christian churches, and has also been restored. Other public buildings are the guild-hall, the corn-exchange, and a theatre. In addition to the royal grammar-school, founded by Henry VIII., there are numerous other schools, a mechanics' institution, museum and free library, an hospital, dispensary, and numerous other charitable institutions. In 1882 Sidney Cooper, R.A., presented an art gallery to the city. Canterbury was formerly noted for its silk manufactures, afterward supplanted by a superior kind of damask linen, which in turn has become extinct. There are several extensive breweries and malting establishments in the town, and leather, bricks, lime, ropes, etc., are manufactured. The principal articles of trade are corn and hops, in the cultivation of the last of which a number of the laboring class are employed. There are extensive barracks for cavalry and infantry. Canterbury sent two members to the House of Commons from Edward I.'s reign till 1885, when it lost one.

The Archbishop of Canterbury is primate and metropolitan of all England, and first peer in the realm after the royal family. He places the crown on the sovereign's head at the coronation, and wherever the court may be the king and queen are deemed his parishioners. The four prelates of London, Winchester, Lincoln, and Rochester, are respectively his provincial dean, sub-dean, chancellor, and chaplain. His province comprehends the sees of 24 suffragan bishops, and he has the nomination of the several officers belonging to the ecclesiastical courts over which he presides, and the privilege of conferring degrees in the faculties of law and divinity; formerly (till 1858) also of medicine. Pop. (1901) 24,868. See Willis, 'Architectural History of Canterbury Cathedral' (1845–69); 'Historical Memorials of Canterbury Cathedral' (1855); Gleeson White (1896); Evans and Goldney, 'Canterbury' (1899).

Can'terbury, New Zealand, a provincial district occupying the centre of South Island; capital, Christchurch. The famous Canterbury Plain, of 2,500,000 acres, slopes gradually down over a descent of 40 miles toward the sea. A rich loamy tract, admirably adapted for agriculture and cattle grazing, extends along the east coast, while the interior is a true pastoral country, well watered by numerous streams, and covered with a perpetual herbage of various grasses. A vast coal-field seems to underlie the whole country, and coal is worked in the districts of Timaru and Malvern. Good fire-clays, quartz, sand for glassmaking, marble, limestone, etc., are also found. The productions include wool, grain, frozen meat, skins and hides, butter, cheese, and some silk. The colony of Canterbury was established in the year 1850 mainly by members of the Church of England. Area, 14,040 square miles. Pop. (1901) 143,040.

Canterbury-bell, a name given to species of *Campanula* (q.v.), especially *C. medium* and *C. trachelium.*

Canterbury Tales. See CHAUCER.

Cantharel'lus. See FUNGI, EDIBLE.

Cantha'rides, kăn-thă'rĭ-dēs, blister-beetles (q.v.) when prepared for medical use. Our native American blister-beetles (especially *Epicauta villata* and *cinerea*) are not inferior to the Spanish-fly in vesicant qualities. By a strange misconception the presence of the brilliant green particles of the wing-cases in the powdered imported insect has been associated with their activity, and any sample of powdered cantharides or of prepared emplastrum where these brilliant particles are wanting would be condemned by many physicians. The recent introduction of the Chinese beetle (*Mylabris cickorii*) has done much to remove this misconception, for it has been shown that the *Mylabris* is much stronger than *Lytta vesicatoria,* yielding, according to analysis, fully double the quantity of cantharidin. Our native blister-beetles, when powdered, nearly resemble the *Mylabris* in color. (Saunders, 'Notes on Cantharides,' 'Canadian Entomologist,' Vol. VIII., December 1876.)

Cantha'ridin ($C_{10}H_{12}O_4$), the vesicating principle of cantharides. The methods of obtaining it consist in treating the powdered insects with a solvent, such as alcohol, ether, or chloroform, the last being preferable. The solution is evaporated, and the residue is purified from a green oil which adheres to it obstinately, by digesting with bisulphide of carbon or by redissolving in alcohol. Purification is further effected by animal charcoal, and the cantharidin is crystallized from hot alcohol or chloroform. It forms white crystalline scales, which fuse when heated and sublime, evolving an extremely irritating vapor. It is insoluble in water, but when mixed with the oils from the insect it is soluble. Chloroform is its best solvent, but it is taken up more or less freely by alcohol, ether, mineral acids and alkalies, and a variety of organic fluids. From most of these it is reprecipitated unchanged by diluting with water, or by neutralizing with the necessary reagent.

Can'thoplasty (Gr. *kanthos,* "the angle of the eye," and *plastikos,* "formative"), the formation by plastic operation of the angle of the

CANTERBURY CATHEDRAL.

CANTERBURY BELLS (CAMPANULA)

Μαθ

eye, an operation proposed by Ammon when the eyelids are not sufficiently cleft, or when the eyelids produce tension on the eyeball, as in inflammatory processes.

Can'ticles, or **Song of Songs** (*Shirhashirim* in Hebrew, the *Canticum Canticorum* of the Vulgate), the fourth book of the Hagiographa, and the first of the so-called Megilloth, has its name of Song of Songs, from the superior beauty of its language and poetry. In a number of dialogues and soliloquies, written in most harmonious verses, it gives a glowing description of the tender, chaste, and faithful love, as well as of the beauty of two lovers betrothed, or bride and bridegroom; of rural scenes among the mountains of Lebanon and Hermon, among the hills and vineyards of Engedi, and in the environs of Jerusalem and Thirza; and of love itself, sweeter than wine, more fragrant than ointments, which cannot be bought, nor quenched by waters, nor drowned by floods. It is ascribed to Solomon, whose palaces, gardens, chariots, horses, guards, and wives are mentioned, enhancing by the contrast, the charms of calm rural life, full of song, innocence, and love. In regard to its form, its plot, and the order of its parts, as well as to its subject, it has been variously classified by ancient and modern writers; by Origen, in the preface to his comments, as an epithalamium in the form of a drama, which is also the opinion of Lowth and Michaelis; by Bossuet as a regular pastoral drama of seven acts, giving the scenes of seven days, of which the last is the Sabbath; by others as a collection of songs or idyls. Dr. Adam Clarke regards it as a poem *sui generis*, composed for the entertainment of marriage guests. Its canonicity has also been a matter of controversy; it seems to have been in question with the Jews at the time of the Mishna. Theodore of Mopsuestiæ, the friend of St. Chrysostom, attacked it most vehemently with arguments derived from the erotic character of the book, and was severely condemned for his attacks. Origen, who is said to have written 10 books of comments on the Canticles, containing no less than 20,000 verses, and his admirer Jerome, are among its most prominent defenders, supported by the circumstance that the book is contained in all the Hebrew copies of the Scriptures, in the translations of the Septuagint, of Symmachus the Jew, and of Aquila, and is mentioned in the most ancient catalogues of the Church, commencing with that of Melito, bishop of Sardis, who lived in the 2d century, though not expressly by Josephus. Modern criticism has also questioned the authorship of King Solomon, and several Aramaic words, the *yod* in the word David, and the abbreviation of the relative *asher*, etc., have been quoted as evidences against the generally accepted antiquity of the book, though none of these is conclusive. But no subject has excited more and livelier controversies, or has been a source of more learned and contradictory disquisition and scrutiny, than the question of the literal or allegoric and mystic sense of the book. Many modern critics both among Jews and Christians, not unsupported by the opinions of ancient and grave authorities, contend for the literal sense. They also widely differ in the interpretation of the meaning and object of the book. These writers account for its reception into the canon on the ground of its praise of faithful love, of conjugal affection, and the chastity of monogamy, or of a misunderstanding of the collectors. The more ancient opinion, on the other hand, which is alone regarded as orthodox in both Church and synagogue, defends the allegorical, religious, and sacred character of the songs. Thus, on the one side the subject is the love of a shepherd, of a youthful king, etc., and the beloved is a shepherdess, an Ethiopian princess, or, according to Grotius and others, the daughter of Pharaoh, wife of Solomon; while, on the other side, love appears as a spiritual affection, as the love of the God of Israel for his chosen but abandoned people, according to the Chaldee paraphrast, the rabbis, and even Luther; of Christ for the Church, between the soul of the believer and Christ, or as the connection between the divine and human nature, according to views current in the Church. Aben Ezra, a Jewish philosopher of the 12th century, finds in the book the hopes of redemption for oppressed Israel; Keiser, the restoration of the Mosaic law by Zerubbabel and Ezra; Hug, an attempt made in the time of Hezekiah to reunite the remnant of the 10 tribes to Judah; others, the love of wisdom; the alchemists, even the search for the philosopher's stone. Dr. Kirschbaum, of Cracow, brings the book down to the time of Hadrian, finds in it the last outbreak of Jewish patriotism and love of liberty, and in the *harai bather* the mountains of Bethar, so heroically defended by Bar-Cokeba. Besides the authors above mentioned who have written upon the Canticles, the names of Erasmus, Le Clerc, Rosenmüller, Eichhorn, Jahn, De Wette, Ewald, Robinson, Stuart, Delitzsch, Renan, Siegfried, Cheyne, and Black, must be mentioned. Mendelssohn and Dr. J. Mason Good have published admirable translations. Of those of Jerome only one is extant.

The name of canticles is also given to certain detached psalms and hymns used in the service of the Anglican Church, such as the Venite exultemus, Te Deum laudamus, Benedicite omnia opera, Benedictus, Jubilate Deo, Magnificat, Cantate Domino, Nunc dimittis, Deus misereatur, and the verses used instead of the Venite on Easter Day.

Can'tilever, a wooden or iron block framed into the wall of a house, and projecting from it to carry moldings, eaves, balconies, etc. The name is given also to a large projecting framework forming part of an iron bridge. See BRIDGE; BRIDGE CONSTRUCTION.

Cantium, căn'tĭ-ŭm, England, an ancient territory in South Britain, whence the English word Kent is derived, supposed to have been the first district which received a colony from the Continent. The situation of Cantium occasioned its being much frequented by the Romans, who generally took their way through it in their marches to and from the Continent. Few places in Britain are more frequently mentioned by the Roman writers than Rutupiæ (now Richborough). Portus Dubris (now Dover), Durobrivæ, and Durovernum (now Rochester and Canterbury) were also Roman towns and stations. Cantium made a part of the province called Flavia Cæsariensis. See KENT.

Canto Figurato, fē-gū-rā'tō, a term applied by the old Christian ecclesiastics to the chant in its more florid forms, or in which more than one note was sung to a syllable.

Canton, John, English electrician: b. Stroud, 31 July 1718; d. 22 March 1772. He settled as a schoolmaster in London, and was elected a Fellow of the Royal Society in 1749. He invented an electroscope and an electrometer; originated experiments in induction; was the first to make powerful artificial magnets; and in 1762 demonstrated the compressibility of water.

Can'ton, William, English writer: b. Isle of Chusan, China, 27 Oct. 1845. He was educated in France for the Roman Catholic priesthood, but decided upon a secular career and was for many years on the staff of the Glasgow *Herald*. Since 1890 he has been sub-editor of the 'Contemporary Review' and manager of the London publishing house of Isbister & Company. He is author of 'A Lost Epic and Other Poems' (1887); 'The Invisible Playmate,' a strikingly original piece of work (1894); 'W. V., Her Book, and Various Verses' (1896); 'The Invisible Playmate, and W. V., Her Book' (with final chapter) (1897); 'A Child's Book of Saints,' republished in the United States as 'W. V.'s Golden Legend' (1898); 'Children's Sayings' (1900).

Canton', China (more correctly *Quang-chow-foo*), a large and important city, situated on the Pearl River, at a distance of 80 miles from the sea. It is situated in the province of Quang-tung (of which name Canton is a corruption), and consists of the city proper and of many suburbs, and its total population is estimated at from 500,000 to 2,500,000. The city proper is enclosed by walls, forming a circuit of six miles, and is divided into two parts by a partition wall running east and west; the portion north of this wall, which is much the larger, being called the old, that on the south of it the new city. The walls, mainly of brick, rise to the height of 25 feet, with a thickness of about 20. There are 12 gates, all of which are shut at night. The streets are long and straight and in general paved with flat stones, but they are very narrow, the average breadth not exceeding eight feet. The houses of the poorer classes are mere mud hovels; those of the shop-keeping class are commonly of two stories, the lower of which serves as the shop. The streets are to a great extent lined with these shops, in which are to be found the productions of all parts of the globe. Neat and gaudily painted signs and names give a gay appearance to the narrow streets; in most cases there are no windows in front, but the whole is thrown open by day and closed at night. Temples and other religious edifices are very numerous, but few of them are in any way remarkable. There are two lofty pagodas, forming a notable feature in any general view of the city. One of these, 170 feet high, is about 1,300 years old, the other, 160 feet high, about 1,000. Among the chief temples, which are far from attractive buildings, may be mentioned those of the Ocean Banner, of the Five Hundred Gods, of Longevity, of the Five Genii. Among other buildings may be mentioned the residences of the governor-general, the commander-in-chief, the treasurer, the prefect, etc. There are four large prisons, one of them capable of holding 1,000 prisoners. In the European quarter are churches, schools, and other buildings in the European style. Wheeled carriages are not in use in Canton; goods are transported on bamboo poles laid across the shoulders of men, while people who can afford it have themselves carried about in sedan-chairs. The river opposite the city for the space of four or five miles presents a most interesting scene. The prodigious number of boats with which it is crowded is the first thing that strikes the eye. A large number of these — as many, it is said, as 40,000, containing a population of 200,000 — are fixed residences, and most of them moored stem and stern in rows. The inhabitants are called tankia or boat-people, and form a class with many customs peculiar to themselves. Millions are born and live and die in these floating dwellings without ever having put foot on dry land; while their ancestors for generations were all amphibious like themselves. The family boats are of various sizes, the better sort being from 60 to 80 feet long, and about 15 feet wide. A superstructure of considerable height, and covered with an arched roof, occupies nearly the whole of the interior of the boat. This structure is divided within into several apartments, devoted to different domestic purposes, all of them being kept very clean. The smaller boats of this description are not above 25 feet long, and contain only one room. By far the handsomest boats are the hwa-ting or flower-boats, which are graceful in form and have their raised cabins and awnings fancifully carved and painted. These are let to pleasure-parties for excursions on the river. The foreign mercantile houses, and the American, British, and French consulates have as their special quarter an area in the suburbs in the southwest of the city, with water on two sides of it. The river banks are faced with a granite wall; handsome hongs or factories have been built, and much money has been spent on improvements. The manufactures and other industries of Canton are varied and important, embracing silk, cotton, porcelain, glass, paper, sugar, lacquered ware, ivory carving, metal goods, etc. The direct trade between the United States and Canton is constantly growing, the exports and imports for 1902 being upward of $15,000,000 and $10,000,000 respectively. Its foreign trade has been known for three centuries throughout the world, and it was the chief foreign emporium in China until 1850, when Shanghai began to surpass it. Since then the opening of other ports and different causes have interfered with its prosperity, but it still carries on a large traffic, its exports and imports together often amounting to about $40,000,000. Business transactions between natives and foreigners are transacted in a jargon known as "pidgin-English." Since the establishment of the colony of Hong Kong there has sprung up quite a flotilla of river steamers, which ply daily between Canton, Hong Kong, and Macao, and convey the greater part of the produce and merchandise for native and foreign consumption. These steamers equal the best river boats of Europe, and carry large numbers of passengers. The climate of Canton is healthy; in July and August the thermometer may rise to 100° F. in the shade, and during winter it is at times below the freezing-point. Canton was first visited by English vessels in 1634. From 1689 to 1834 the East India Company had a monopoly of the English trade. In 1839 war was declared by Great Britain against China, and Canton would have been occupied but for being ransomed by the Chinese. In the war of 1856 the foreign factories were pillaged

and destroyed, and about a year after this Canton was taken by an English force. From this time to 1861 it was occupied by an English and French garrison. Since then it has been open to foreign trade.

Can'ton, Ill., city of Fulton County, situated on the Chicago, B. & Q. and the Toledo, P. & W. R.R.'s. It is the centre of trade of a fertile agricultural region; and has numerous industrial interests, including a large manufactory of agricultural implements, cigar factories, etc.; a public library and a high school. There are coal mines within the city limits. Pop. (1900) 6,564.

Canton, N. Y., a village and county-seat of Saint Lawrence County, on Grass River, and the Rome, W. & O. R.R., 59 miles northeast of Watertown. It is the seat of St. Lawrence University, and has large flour and lumber interests, a national bank, weekly newspapers, several churches, and an assessed property valuation of over $3,000,000. Pop. (1900) 2,757.

Canton, Ohio, city and county-seat of Stark County, on Nimisilla Creek and the Pennsylvania, the Baltimore & O., and the Cleveland, C. & S. R.R.'s; 60 miles south of Cleveland. It is in a fine fruit and wheat-growing district, with coal, limestone, and pottery clay in the vicinity, and was for many years the residence of President McKinley whose tomb is here. It is a manufacturing city of considerable importance. The principal industries are the manufacture of agricultural implements, brick and tile, foundry and machine-ship products, iron bridges, steel goods, and stoves. There are three national banks, besides several State and savings banks. The city has an electric light and street railway system, and well-paved streets. Among the notable buildings are the post-office, high school, public library, the United States signal service station, and several churches. Pop. (1900) 30,667.

Canton, S. D., the capital of Lincoln County, on the Sioux River, 20 miles from Sioux Falls. It is on the Chicago, M. & St. P. R.R., and is the seat of Augustana College. The town contains eight churches, public schools, and important manufactories, and is lighted by electric light. Pop. (1900) 1,943.

Canton, a small division of territory, constituting a distinct state or government, as in Switzerland, where each of the 22 states is so designated. In France judicial districts are called cantons.

Canton River. See CHUKIANG.

Cantoni, kän tō'nē, **Carlo,** Italian philosopher: b. Gropello, 1840. He studied law and philosophy at Turin, and philosophy at Berlin and Göttingen (under Lotze). He was professor at the lyceum at Turin, and in Milan; since 1878 he has been professor of philosophy at the University of Pavia. In his philosophical theory he agrees in general with Kant. He wrote: 'G. Battista Vico, studii Virtu e Comparazione' (1867); 'Corso Elementare di Philosofia' (1870); 'Guiseppe Ferrari' (1878); 'Emanuele Kant' (1879-84).

Canton'ment, the district in which troops are quartered when they are not collected into a camp, but detached and distributed over the neighboring towns and villages. The object of sending troops into cantonments is to be able to concentrate them as quickly as possible on one spot, when circumstances do not admit of a camp being formed, or do not render it advisable to form one. In India the permanent military stations erected in the neighborhood of the principal cities are so called.

Cantu, Cesare, chā-zā-rē kän'too, Italian historian, poet, and philosopher: b. Brisio, 5 Sept. 1805; d. 11 March 1895. He was educated at Sondrio in the Valtellina, where he taught belles-lettres at a youthful age, resided afterward in Como, and next at Milan until 1848. One of his earliest works, entitled 'Ragionamenti sulla Storia Lombarda nel Secolo XVII.' ('Lectures on the History of Lombardy in the 17th Century'), appeared in a second edition in 1842-4, and contained liberal ideas that brought upon the author the animadversion of the Austrian government, which condemned him to a year's imprisonment. During his confinement he composed a historical romance, entitled 'Margherita Pusterla' (1845), which became very popular. His great work, on which his reputation will chiefly rest, 'Storia Universale' ('Universal History'), appeared first in 1837, at Turin. It has been since revised and reprinted at Palermo and Naples, and translated into German. A French translation by Aroux and Leopardi, was published in Paris in 1843. Other works of his are: 'Storia degli Italiani' (1854); 'The Last One Hundred Years' (1864); 'The Italian Heretics' (1866-8). See Bertolini, 'Cesare Cantu e le sue opere' (1895).

Cantus Firmus, an ancient chant of the Roman Catholic Church. These chants were adopted as standing melodies, and until counterpoint was discovered, were unaccompanied, or only harmonized with octaves.

Canuck', a term sometimes used in the United States to denote a Canadian.

Canute IV., Saint, king of Denmark 1080-6. He suppressed the ancient heathen customs of his people, and thus aroused opposition; in 1085 he started on an expedition against William the Conqueror, but was murdered by rebels in his own army. He was canonized in 1101 and in the Middle Ages was considered the patron saint of Denmark.

Canute (kā-nūt') **the Great, Knud,** or **Knut,** the second king of Denmark of that name, and first Danish king of England: b. in the former country, about 995; d. Shaftesbury, England, 1035. He was the son of Sweyn, king of Denmark, and accompanied his father in his victorious campaigns in England. Sweyn, having proclaimed himself king of England, died in 1014, before his power was established, and appointed Canute his successor there. The latter was immediately driven out by Ethelred, the representative of the Saxon line, and fled with 60 ships to the court of his brother, Harold, king of Denmark. Harold enabled him to collect a large fleet in the north to prosecute his cause in England. He invaded that country anew in 1015. He fought many battles with Edmund Ironside, who had succeeded his father, Ethelred, in 1016, and was finally victorious at the battle of Assington. After this battle, Edmund and Canute agreed upon a division of the kingdom. To Canute were assigned

Mercia and Northumbria, while the Saxon prince preserved West and East Anglia. By the death of his brother, Harold, he obtained the crown of Denmark (1016). In the same year, and but one month after the ratification of the treaty of partition, Edmund died, and Canute became sole king of England without further resistance. He refrained from murdering the children of his late rival, and sent them to his half brother, Olave, king of Sweden. He put away his wife, Alfgive, the daughter of the Earl of Northampton, and espoused Emma, the widow of Ethelred, the Saxon monarch (1017), on the condition that their children should succeed to the throne of England. He made the greatest exertions to gain the affections of his English subjects, to whom his Danish origin was no recommendation. He accordingly disbanded his Danish army, retaining only a body-guard. He endeavored to blend the two races as far as possible, and to induce them to live in harmony with each other. He erected churches, and made donations to abbeys and monasteries on the scenes of former conflicts and massacres. In a witenagemote at Winchester, he compiled a code of laws which is still extant. In this code he denounced those who kept up the practice of pagan rites and superstitions, and forbade the sending of Christian slaves out of the country for sale. Although Canute generally resided in England, he made frequent visits to Denmark. He carried with him on these occasions an English fleet, English missionaries, and English artisans. He promoted three Englishmen to the newly erected bishoprics of Scania, Zealand, and Fionia. In 1025 he was attacked by the king of Sweden and defeated; but in the night, Earl Godwin, at the head of the English contingent, surprised the Swedish camp and dispersed the enemy. His absence from Denmark, and the bestowal of so many dignities in Denmark upon his English subjects, made him unpopular in that kingdom. To appease this discontent, he left behind in Denmark his son, Hardicanute, then aged 10 years, under the guardianship of his brother-in-law, Ulf (1026). In this year he made a pilgrimage to Rome. He was well received there by the Pope John, and by the Emperor Conrad II., who gave up to the Danish king all the country north of the river Eider. From the Pope he obtained privileges for the English school established in Rome, and an abatement of the sums demanded from his archbishops for the pallium; and from the various princes, relief for all English and Danish pilgrims and merchants from all illegal tolls and detentions which they had endured on their route to Rome. He returned from Rome to Denmark. In 1028 he made an expedition into Norway, expelled Olave, and restored Haco, who swore allegiance to him. In 1029 he returned to England, and his Danish subjects proclaimed Hardicanute king of Denmark. Canute immediately returned to Denmark, put down the revolt, and executed the traitor, Ulf. In 1031 Canute was acknowledged king of Norway, and laid claims to the crown of Sweden. On returning again to England, he allowed his son, Hardicanute, to share with him the Danish crown. His reign is very important in the constitutional history of Denmark. Canute issued the first national coinage of Denmark, and published the first written code of Danish law, wherein the custom of private vengeance was prohibited. He raised the clergy in their corporate capacity to a separate estate of the realm, and instituted the Thinglith or royal guard of 3,000 men. The members of this body were all men of good family, and rich enough to equip themselves at their own expense. From them sprang the Danish order of nobility; they were tried only by their peers, and formed with the king the highest court of justice. Canute's last campaign was against Duncan, king of Scotland, respecting the possession of Cumberland, but before the armies could engage the two kings were reconciled, and ancient stipulations concerning the tenure of Cumberland were renewed (1033). Canute was buried at Winchester. By Emma he had two children, namely, Hardicanute or Canute the Hardy, and a daughter, Gunhilda, married to Henry, the son of Conrad II., of Germany, emperor. By Alfgive he left two sons, Sweyn and Harold. To Sweyn was given the crown of Norway; Hardicanute retained that of Denmark, and Harold, surnamed Harefoot, took possession of that of England. Canute is most popularly known, not by his extended rule and legislative enactments, but by the familiar story of the monarch, the courtiers, and the disobedient sea.

Can'vas, a textile fabric made of the fibres of hemp; or any strong, firm cloth, whether of hemp or flax. It is chiefly used for tents, and for the sails of sailing vessels, for which its strength makes it well adapted. Varieties of it are also used as the ground of tapestry work and of oil paintings. A finer description is used for many common domestic purposes, as for towels, table-cloths, etc. Canvas for sails is made from 18 to 24 inches wide, and numbered 0 to 8, No. 0 being the thickest. A bolt is 39 to 40 yards long, and weighs 25 to 48 pounds.

Canvas-back, a widely distributed fresh-water duck (*Aythya vallisneria*), much sought as a table luxury, as its flesh is considered superior to that of all other ducks. It is about 22 inches in length and its reddish-chestnut head and neck are much shaded with dusky hues; the lower neck, breast, and forepart of the back, with the rump and tail-coverts, are black; and the back and sides gray, covered with fine lines and dots, so that the plumage resembles canvas. By reason of its similarity, this duck is frequently confounded with the red-head (q.v.). "The canvas-back is larger, its head darker, and its bill a deep black, while that of the red-head is deep blue, or a slatish color. The shape of the bill of the canvas-back is wedged and long; of the red-head moderately long and concave. . . . They are very tenacious of life, their bump of stubbornness being fully developed, and they will dive long distances, and prefer death by any other means than human agency. When one is crippled it will usually look around for an instant, to see where the danger lies, then down it goes, and if rushes or cover are near, it is good-bye to that duck,—it will not be seen again. When one is crippled it should be shot again, and at once." The food of the canvas-back consists chiefly of the roots of wild celery (*Zostera vallisneria*), which resembles the cultivated celery in appearance. It grows densely in the shallow parts of the Chesapeake Bay and Susquehanna River, about the Great Lakes, and in the Mississippi valley. Few canvas-backs are

found east of the Hudson and Delaware rivers. It is almost safe to say that where the plant grows in abundance, the canvas-back is almost sure likewise to be found; consequently the peculiarly delicate flavor of its flesh, and the market value of this duck, increase with the amount of celery it consumes, as otherwise it is hardly distinguishable from the red-head in flavor. The canvas-back breeds north of Dakota, building its nest on the ground, in a marsh, and laying from 6 to 10 greenish-buff eggs. Consult: Elliot, 'Wild Fowl of North America'; Job, 'Among the Wild Fowl.'

Canzone, kän-tsō'nā, a lyric poem, of Provençal origin. It is found in the Italian poetry of the 13th century. At first it was quite irregular, but was confined by Petrarch to more fixed and regular forms. Hence it is called canzone Petrarchesca; it is also called canzone Toscana, because it originated in Tuscany. It is divided into several stanzas, in which the nature and disposition of the verses, which are of 11 and 7 syllables, and the place of the rhymes, are uniform. The canzone usually concludes with a stanza which is shorter than the others, and is called ripresa, comgedo, comiato, signifying dismission or taking leave. There are different kinds of canzoni, and different names are given to the different parts. The canzone Anacreontica is divided into small stanzas, consisting of short verses, with a regular disposition of the rhymes through all the stanzas. Not only light, pleasing songs of love, gaiety, and mirth, but poems on solemn and lofty subjects, and of an elevated dithyrambic strain, are included under this name. The latter subjects, however, are better adapted to the canzone Pindarica, which was first introduced in the 16th century, by Luigi Alamanni, and owes its perfection chiefly to Chiabrera. It is distinguished from that of Petrarch by a bolder flight, loftier ideas, greater freedom in the choice and disposition of the verses, and by the form of the stanzas, which is borrowed from the Greek chorus. The Pindaric canzoni are divided into strophe, antistrophe, and epode, and are called canzoni alla Greca. Those divisions are sometimes called ballata, contraballata, and stanza; or volta, rivolta, and stanza; the Greek names are the most common. There is also the canzone a ballo, an old Italian poem, originally intended to be sung at a dance (ballo). It is called also ballata. It is not employed by the Italian poets later than the 16th century.

Canzonet, kän-tsō-nĕt', **Canzonetta,** in Italian poetry a canzone (q.v.), consisting of short verses, much in use with the poets of the 15th century. Rinuccini, and after him Chiabrera, have used it in modern times, and given it more grace. Canzonets are generally expressive of tender feelings. In music, canzonet signifies a song, shorter and less elaborate than the aria of the oratorio or opera.

Caonabo', kä-o-nä-bō', Indian chief of Hispaniola (Haiti) at the time of its discovery by Columbus. The latter built a fort which he called La Navedad, and in which he left, when sailing for Spain early in 1493, a garrison of 40 men — among them one Irishman and one Englishman, as shown by Navarrete's list. Returning before the end of the year, he found that Caonabó had burned the fort and killed the garrison. According to the account of a friendly native, the Spaniards had drawn this fate upon themselves by their evil conduct. It has been suggested, as a reason for special regret, that we might otherwise have had from the Englishman or the Irishman an eye-witness's description of the first voyage of Columbus, in our own language. In 1494 the Indians in great numbers attacked the Spaniards, having been provoked by the misconduct of one of the lieutenants of Columbus, Pedro Margarite. Columbus overthrew them, first at Magdalena, and later (1495) on the plains of the Vega Real — where, tradition has it, 100,000 hostiles were assembled. Caonabó meanwhile threatened the garrison of St. Thomas. Alonso de Ojeda was sent by Columbus to cajole Caonabó into coming to a conference. Ojeda went alone among the hostiles. As presents he took gyoes and manacles of shining metal; treacherously persuaded the prince to show himself to his subjects wearing these novel ornaments, and even, while thus adorned, to ride Ojeda's horse; then, mounting also, he dashed through the crowd of savages and carried his victim into the presence of Columbus. Sent to Spain for trial, Caonabó died in 1496.

Caoutchouc, koo'chook, an elastic, gum-like substance, obtained from the juice of certain tropical trees and shrubs, and commonly known as India-rubber or «rubber.» The best caoutchouc comes from the Para region, in Brazil; but supplies are also obtained from Central America and the West Indies, from Africa, and from tropical Asia. The details of collecting the juice and preparing it for market vary somewhat according to the locality, and with the nature of the trees or shrubs from which the juice is obtained. In the Amazon region, when the source is a tree, incisions are made in the bark each morning, and the milky sap that exudes is collected in little tin or clay cups that are secured to the tree for the purpose. At the end of about 10 hours these are emptied into larger collecting vessels, and on the morning of the following day new incisions are made in each tree, some eight inches below the first ones. This process is continued until incisions have been made in the bark from a height of about six feet down to the ground. The poorest quality of sap is obtained from the highest wounds, and the best from the lowest ones. To evaporate the juice, a fire is first built of materials that yield dense volumes of smoke. A workman then dips a wooden paddle into the collected sap, after which he holds it in the smoke until the sap solidifies and acquires a slight tinge of yellow. He then dips the paddle into the sap supply again, repeats the smoking process, and so proceeds until the paddle is covered with a layer of the dried gum that is perhaps an inch and a half thick. He then slits this layer, removes it from the paddle, hangs it up to dry, and starts a fresh evaporation.

Pure caoutchouc from Para is light-colored below the surface, but superficially it is dark brown from oxidation. It has a specific gravity of about 0.92, and consists chiefly of carbon and hydrogen in the proportion of about 87 per cent of carbon to 13 of hydrogen. Small quantities of oxygen are always present, however, as the best of the Para product contains as much as one half of 1 per cent of a sort of resin that

contains oxygen, and is undoubtedly produced by the oxidation of the gum. In fact, it is known that caoutchouc will oxidize slowly in damp air, even after it is vulcanized, and particularly when exposed to the action of light. Caoutchouc consists, apparently, of two different kinds of gum, one of which is fibrous, while the other is viscous, though the two are chemically identical. It is slightly soluble in ether, turpentine, chloroform, petroleum, naphtha, benzene, and carbon disulphide, the viscous portion being more soluble than the fibrous part. At 250° F. caoutchouc begins to melt, and becomes permanently transformed into a sticky substance which retains its peculiar consistency almost indefinitely. At 400° F. the transformation is more complete, and the black, adhesive mass that results makes an excellent lute for sealing glass bottles and jars if it is thoroughly incorporated with 50 per cent of its own weight of dry slaked lime. By careful destructive distillation caoutchouc is resolved into a number of hydrocarbon oils that are of interest to the chemist.

As early as 1615 the Spaniards used the crude gum "for waxing their cloaks, which were made of canvas, so as to make them resist water." But it was not until about 200 years later that caoutchouc began to attract general attention in such ways. At first it was applied to cloth by the aid of heat; but improved methods followed the discovery of solvents for the gum, and the invention, by an Englishman named Thomas Hancock (about 1820), of the "masticator," a machine by which the caoutchouc is thoroughly worked over and brought to a uniform consistency. But the greatest step in the development of the rubber industry was the discovery of the process of vulcanization,—a discovery that appears to have been made independently and at about the same time (1843) by Charles Goodyear, of New Haven, Conn., and Thomas Hancock, to whom reference has previously been made. The credit of priority belongs to Goodyear, but Hancock did a great deal to make the discovery a commercial success. Unvulcanized caoutchouc is softened by heat, and is made hard and inelastic by cold; but upon being vulcanized the gum becomes comparatively insensible to ordinary extremes of temperature, and also has its elasticity materially increased. The process of vulcanization depends upon the fact that the crude rubber will absorb sulphur, and combine with it at a temperature that is easily attainable without injury to the product. The details of the vulcanization differ somewhat, according to the nature of the article that is being manufactured. If sheet rubber is submerged for a few moments in melted sulphur at a temperature of 250° F., it absorbs about one tenth of its weight of that element; but although its color changes somewhat it is otherwise apparently unaltered. Upon exposure for a somewhat longer time to a temperature of 285° F., however, true combination of the sulphur and caoutchouc ensues, and the gum is said to become "vulcanized." It is not necessary that the sulphur should be actually melted in order that the sheet rubber may absorb it, for sheets that are laid in powdered sulphur that is heated nearly to its melting-point will absorb the proper amount for good vulcanization in the course of a few hours. Vulcanization of rubber sheets can even be brought about without the action of heat, by dipping the sheets for a few seconds in a solution of chloride of sulphur in carbon disulphide. It is more common, however, to knead the requisite amount of sulphur directly into the caoutchouc by mechanical means. The article to be manufactured is then brought into shape by the action of pressure and moderate heat (or in any other manner), and the final operation consists in heating it to the vulcanizing temperature by the aid of a steam bath. Chemically considered, the process of vulcanization appears to consist in the substitution of one or more sulphur atoms for a portion of the hydrogen of the hydrocarbons of which the caoutchouc is composed. See INDIA RUBBER; RUBBER MANUFACTURE.

Cap, the cover of the end or head of anything. Caps were not worn by the Romans for many ages. When either the rain or sun was troublesome the lappet of the gown was thrown over the head; and hence all the ancient statues appear bareheaded, excepting sometimes for a wreath or the like. The same usage prevailed among the Greeks, to whom, at least during the heroic age, caps were unknown. The sort of caps or covers of the head in use among the Romans on divers occasions were the *pitra, pileus, cucullus, galerus,* and *palliolum,* which are often confounded by ancient as well as modern writers. The general use of caps and hats is referred to the year 1449. The first seen in Europe were used at the entry of Charles VII. into Rouen. From that time they began to take the place of *chaperons* or hoods. When the cap was of velvet they called it *mortier;* when of wool simply *bonnet.* None but kings, princes, and knights were allowed to use the *mortier.* The cap was the head-dress of the clergy and graduates. Pasquin says that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off, as an incumbrance, left the round cap an easy commodious cover for the head; which cap, being afterward assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman called Patrouillet. He adds, that the giving of the cap to the students in the university was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors, in imitation of the ancient Romans, who gave a *pileus* to their slaves in the ceremony of making them free: whence the proverb *vocare servos ad pileum:* hence, also, on medals, the cap is the symbol of Liberty, who is represented holding a cap in the right hand by the point.

Cap of Maintenance, one of the ornaments of state carried before the sovereigns of England on the occasion of their coronation. It is also applied to an ornament borne before the mayors of certain cities on state occasions, and to a device in heraldry.

In ship-building a cap is a square piece of timber having two holes cut through it,—one square to fit on the squared or tenon head of the lower mast; the other round, to take the heel of the upper mast. Also a similar contrivance affixed to the end of the bowsprit, through a round hole in which the jib-boom is rigged.

In mining, a mass of unproductive rock overlying valuable ore; and in physical geography,

a similar mass, as of ice overlying the surface of a country; as, the ice-cap of Greenland.

For the term as used in military parlance, see PERCUSSION CAP.

Capacity, Specific Inductive, a term introduced by Faraday, the discoverer of the property, to denote the relative powers or capacities of insulating media, called by him dielectrics, for transmitting electrostatic inductive influence. When an electrified body is brought near to a non-electrified conductor, an electric disturbance takes place at the surface of the latter, electricity of the kind opposite to that which the charged body possesses being attracted and the opposite kind being repelled. This disturbance is said to be due to *induction*. (See INDUCTION, ELECTROSTATIC.) Faraday discovered that it depends for intensity on the nature of the insulating medium between the two bodies, showing that, other things remaining the same, the disturbance is greater with some media than with others. The view that Faraday took of induction was altogether opposed to that which was held previous to the time of his investigations, and which was expressed by speaking of induction as action of electricity at a distance: and by experiments on liquid insulators, and in other ways, he proved that what was looked on as influence at a distance is really an influence transmitted by means of the intermediate particles of the insulating substance. The medium he termed the *dielectric*. He showed that the particles of the dielectric are in a polarized condition when it is exposed to electric force. (For a full exposition of Faraday's theory of induction see INDUCTION, ELECTROSTATIC.)

In order to compare the inductive capacities of various substances, Faraday made use of the fact that the capacity for electricity of a Leyden jar depends on the inductive capacity of the insulator which separates the interior and exterior coatings. He constructed two spherical Leyden jars precisely similar, so far as the conductors were concerned, but arranged so that the insulating medium might be varied. Having charged one of the jars he connected the other to it, the inside coatings together and likewise the outside coatings. Part of the electricity in the charged jar under these circumstances passes into the uncharged jar; and the jars being identical in form, it is divided between the two jars in proportion to the inductive capacities of their respective insulators. By determining the quantity in each jar the inductive capacities of the insulators are compared.

Faraday found that all the gases he experiment d on have the same inductive capacity. He took common air as the standard of reference, and found the following numbers to represent the specific inductive capacities of the various substances compared with it:

Air	1.00	Wax	1.86
Spermaceti	1.45	Glass	1.90
Resin	1.76	Shell-lac	2.00
Pitch	1.80	Sulphur	2.24

Later investigations on specific inductive capacity have been made with a "platimeter," devised by Sir William Thomson (Lord Kelvin), and are far more accurate than any that could be made with Faraday's apparatus.

Capa'neus, one of seven legendary heroes who warred against Thebes, killed by Jupiter.

Cap-à-pie, kăp-ą-pē (O. Fr. *de cap à pie;* Mod. Fr. *de pied en cap*), a term signifying from head to foot, and used with reference to a complete suit of armor covering the body of a knight at all points; as, "He was armed cap-à-pie for the encounter."

Cape Ann, Mass., the southeast point of the town of Gloucester, Mass., the northern limit of Massachusetts Bay; in lat. 42° 38′ N., and lon. 70° 34′ W. The whole of the rocky peninsula forming this part of Gloucester is also called Cape Ann, including the village of Squam in its northeastern part. This peninsula is a headland of sienite, which forms low hills, over the surface of which the rock is very generally exposed to view. Valuable quarries of sienite for building purposes are worked most conveniently for shipment. The place is much exposed to the prevalent northeast storms; but it offers a small, well-sheltered harbor among the rocks, where coasting vessels often take refuge. There are on the shores of this harbor two fixed lights.

Cape Ann Settlement, the first within the limits of the Massachusetts Bay territory. In 1622, the New England Company, to push the settlement of its grant and give it some value, divided the land in severalty among its members. The region about Cape Ann fell to Edmund, Lord Sheffield, who sold a patent for it in 1624 to Robert Cushman and Edward Winslow of the Plymouth colony. They found some English hunters and fishers who had been there since the year before; these acknowledged the rights of the Plymouth people, and the two parties planted and fished amicably; but shortly after a London vessel which had taken up the quarrel of the firebrand, Rev. John Lyford, seized the Plymouth men's fishing stage. Miles Standish came up from Plymouth to settle the trouble by force, but against his wish, the settlement compromised the matter by the crew agreeing to build them another stage. In 1624 Winslow's company sold the site of Gloucester to the "Dorchester Adventurers," an unincorporated English joint-stock company recently formed. These had anticipated the bargain by sending out a band of settlers the fall before, with live stock, implements, etc., and they made Thomas Gardner overseer. The attempt was unsuccessful, and in 1625 the Dorchester company engaged Roger Conant, then at Nantasket with Lyford, to be governor, Lyford to be minister. But the next year the "Adventurers" dissolved, and most of the settlers went home; the few remaining ones removed to "Nahumkeike" (Naumkeag), and founded Salem.

Cape Ar'ago, a cape on the western coast of Oregon, on the south of Coos Bay. Its lighthouse, which is on a small island, is in lat. 43° 20′ 38″ N., and lon. 124° 22′ 11″ W., and shows a white, flashing light.

Cape Bab-el-Mandeb. See BAB-EL-MANDEB.

Cape or Point Barrow. See BARROW, CAPE OR POINT.

Cape Blanco, Africa. See BLANCO, CAPE.

Cape Blanco, Oregon, a cape forming the most western point of the State, situated in lat. 42° 50′ N., and lon. 124° 32′ W. It has a lighthouse with a white fixed light, 256 feet above sea-level.

Cape Boeo, bō-ā'ō, the ancient *Lilybæum Promontorium,* a cape, on the western coast of Sicily, one mile from Marsala. It is the point of Sicily nearest to ancient Carthage, and at an early period became an important naval station. The naval victory of the Romans over the Carthaginians, which put an end to the first Punic war, was gained near this point.

Cape Bojador, bŏj-ą-dōr'. See BOJADOR, CAPE.

Cape Bon, or **Ras Adder,** a headland of Tunis, on the Mediterranean, forming the northernmost point of Africa, in lat. 37° 6′ N., and lon. 11° 3′ E.

Cape Breton, bret'ŭn, Canada, an island of the Dominion of Canada, separated from Nova Scotia, to which province it belongs, by the narrow Gut or Strait of Canso; area 3,120 square miles; length about 110 miles. It is of very irregular shape, the Bras d'Or, an almost landlocked arm of the sea (with most picturesque scenery), penetrating its interior in various directions, and dividing it into two peninsulas connected by an isthmus, across which a canal has been cut. The surface is rather rugged, and only small portions are suited for agriculture; but it possesses much timber, valuable minerals (several coal mines being worked), and the coast abounds in fish. Timber, fish, and coal are exported. The island belonged to France from 1632 to 1763, and Louisburg, its capital, was long an important military post. It was separate from Nova Scotia between 1784 and 1820. The chief towns are Sydney and Arichat. Pop. (1901) 97,190.

Cape Canav'eral, a cape on the eastern coast of Florida, in lat. 28° 27′ N., and lon. 80° 33′ W. There are dangerous shoals at this point, and navigation is protected by a revolving light.

Cape Canso, the eastern extremity of Nova Scotia, at the entrance of Chedabucto Bay, in lat. 45° 19.5′ N., and lon. 60° 55′ W.

Cape Car'thage, a headland on the northeast coast of Tunis, jutting out into the Mediterranean. Traces of the ancient city of Carthage are found on it to the north of the Tunis lagoon.

Cape Catoche, kā-tō'chā, a headland at the northeastern extremity of the peninsula of Yucatan, Central America, in lat. 21° 34′ N., and lon. 86° 57′ W. It was on this spot that the Spaniards first landed on the American continent.

Cape Charles, a cape at the northern entrance of Chesapeake Bay, forming the southern extremity of Northampton County, Va., in lat. 37° 07′ N., and lon. 75° 53′ W. Northeast of it, on Smith's Island, is a lighthouse with a revolving light.

Cape Clarence, a headland at the northern extremity of Jones' Sound, Baffin Bay. It is surrounded by inaccessible mountains whose summits are covered with perpetual snow.

Cape Clear, a headland forming the southernmost extremity of Ireland, in lat. 51° 26′ N., and lon. 9° 29′ W. It is on an island of 1,506 acres, with a lighthouse on an abrupt cliff 455 feet high.

Cape Coast Castle, a town and fort of western Africa on the Gulf of Guinea, in the British colony of the Gold Coast, in lat. 5° 5′ N., and lon. 1° 13′ W. The place lies in a chasm, and is defended by the great castle near the water's edge, and by three small forts on the hills behind, one of which serves as a lighthouse and signal station. With the exception of a few houses for Europeans, the town consists of straggling lines of mud huts, with clusters of palm-trees and an occasional tamarind attached. It is a principal mart for native trade. It is connected by telegraph with Accra (the capital), and by road with Prahsue. The climate is unhealthy; mean temperature, 78°. The principal exports are gold-dust, ivory, and palm-oil. Cape Coast Castle was ceded by the Dutch to the English in 1665, and from 1672 was possessed by several British African companies till 1843, when it was taken over by the British government. Pop. about 12,000.

Cape Cod, a cape and peninsula on the coast of Massachusetts, on the south side of Massachusetts Bay, forming the county of Barnstable; lat. of the cape, 42° 3′ N., lon. 70° 15′ W. The peninsula is 65 miles in length and from 1 to 20 in breadth, and is in the form of a man's arm, bent inward both at the elbow and the wrist. Though mostly sandy and barren, it is nevertheless populous; and the inhabitants derive their subsistence chiefly from the sea. The best harbor on the peninsula is at Provincetown. There is a lighthouse known as the Highland Light, on the northeast shore and one at Race Point almost directly west of the former. The navigation around the cape is peculiarly baffling, and hazardous, and the saving to commerce and human life which would result from a short-cut waterway would be great. A proposition to cut a canal from Buzzard's Bay to Barnstable Bay dates from the early part of the 17th century, but nothing was actually done until 1878, when a charter was granted by the legislature of Massachusetts, a company was formed, and work begun. The cape was discovered 15 May 1602 by Bartholomew Gosnold, who gave it its name from having taken a great quantity of codfish near it. In 1620 the Pilgrims of the Mayflower made a temporary landing at the site now occupied by Provincetown.

Cape Cod, a book of travel and description by Henry D. Thoreau, published in 1865. Until Thoreau arrived to make acquaintance with its hard yet fascinating personality, Cape Cod remained unknown and almost unseen, though often visited and written about by tourists and students of nature. Something in the asceticism, or the directness, or the amazing keenness of Thoreau's mind brought him into sympathetic understanding of the thing he saw, and he interpreted the level stretches of shore with absolute fidelity. In this, as in his other books, Thoreau rises from the observation of the most familiar and commonplace facts, the comparison of the driest bones of observed data, to the loftiest spiritual speculation, the most poetic interpretation of nature.

Cape Colon'na. See SUNIUM.

Cape Colony, a British colony at the southern extremity of Africa, washed on the west, south, and east by the ocean, and having on the north and northeast the German terri-

tory of Great Namaqualand, the British territory of Bechuanaland, the Orange River Colony, Basutoland (British), and the colony of Natal. A considerable portion of the boundary on the north is formed by the Orange River. The colony extends about 450 miles from north to south, and 600 from east to west; the coast line is about 1,300 miles. The area is 276,000 square miles. The principal indentations of the coast are St. Helena, Saldanha, Table, False, Walker, Mossel, Plettenberg, St. Francis, and Algoa bays.

In the interior almost every variety of soil and surface is found, but a great part of the colony is arid and uninviting in appearance. Several ranges of mountains, running nearly parallel to the southern coast, divide the country into successive terraces, rising as they recede into the interior, between which lie belts of fertile land, or vast treeless and barren-looking plains. One of these, called the Great Karoo, is 300 miles long and 100 broad, and presents a desolate appearance, having a dry and often baked soil, with small shrubby plants scattered over it. Yet these plains make valuable sheep-walks, the flocks thriving exceedingly well upon the scanty vegetation; and the soil, where water can be obtained by collecting the rain, is generally very fertile. Large reservoirs have been constructed in many places, and permanent homesteads established where formerly flocks could only be maintained for a month or six weeks at a time. The principal and farthest inland mountain terrace averages 6,000 or 7,000 feet in height, and, commencing in Namaqualand, runs eastward under the names of Roggeveld, Nieuwveld, Sneeuwbergen, Stormbergen, etc., to the northeast frontier. The culminating point is the Compass Berg, over 8,000 feet high. The Table Mountain at Cape Town is a stupendous mass of naked rock, rising almost perpendicularly, about 3,585 feet in height. The colony is deficient in rivers, though in this respect the eastern half is more favored than the western. The Orange River is the largest in this part of Africa, but is of little or no use for navigation. Others are the Elephants or Olifants River, flowing into the Atlantic; the Gauritz, Gamtoos, Great Fish, Sunday, and Great Kei, emptying themselves into the sea on the south and southeast.

The most valuable mineral product is diamonds; copper ore is largely exported; coal is mined, and iron ore, gold, amethysts, agates, etc., are found. The bulk of the diamonds that come into the markets of the world in the rough state are now obtained from Cape Colony. The great mining centre is Kimberley, in the far north of the colony, about 10 miles from the Vaal River, and near the frontier of the Orange River Colony. So far as is known, the first of the South African diamonds was casually picked up in 1867, and soon after several others were found, including a fine large stone known as the "Star of South Africa." By the early part of 1870 so many diamonds had been found that a rush of people to the diamond district began to take place, and the banks of the Vaal were soon covered with thousands of diggers. At first the precious stones were found on or near the surface, but subsequently it was discovered that they were to be found deeper down, and latterly they have been obtained many hundreds of feet below the surface, great open excavations having been made at the localities where they are plentiful. The richest mine has been the Kimberley mine, situated in the centre of the town of the same name, which sprang up around it. For the first hundred feet in depth the diamonds were found embedded in a soft, friable, yellowish earth; below that the soil changed to a slaty-blue color, and was of a firmer consistency, and the diggers then thought that the bottom of the mine had been reached. It was soon discovered, however, that the blue ground yielded as many diamonds as the yellow, if not more, and this productivity has still continued. Another famous mine is the De Beers mine. Both these mines have yielded a remarkable number of large stones, but a great many of the diamonds have been "off-color," that is, yellow, spotted, or otherwise defective in water or lustre. One of the finest yet found in South Africa is the "Porter Rhodes," a beautiful stone weighing 150 carats, and valued at $300,000 One much larger, a yellow stone, weighing 302 carats, was found in 1884, and a still larger, weighing 428½ carats, was found in the De Beers mine in 1888. The largest in the world, weighing 971 carats, but with a large flaw, was found in the Orange Free State in 1893. Although mining operations have been carried on at great expense, owing to the depths to which the workings have been sunk (some 600 feet or more), the profits of the companies which latterly have owned the mines have been enormous. The rough work has been done almost entirely by the native Africans, of whom 10,000 or 11,000 have been in employment in the mines at one time. Very stringent regulations have had to be enforced to prevent theft of the precious stones, and also illicit dealing in stones unlawfully acquired.

The climate is very healthy and generally pleasant, though in summer the heat is great in some parts. The mean temperature for the year at Cape Town is about 62°. The climate of the dry and elevated inland districts is considered remarkably suitable for persons of consumptive tendency, and many have been attracted to the colony on this account.

Except along the coast line, especially the southeast coast district, where there are extensive forests, timber is scarce. There are upward of a hundred different kinds of woods, however; many of them extensively employed for such purposes as house-building, wagon-making, and furniture- and cabinet-work. With irrigation, trees can be grown anywhere. The aloe and the myrtle attain a great size.

The quadrupeds of the colony comprise the African elephant, still found in the forests of the south coast region; the buffalo, equally restricted in locality; the leopard, jackal, hyæna, numerous antelopes, baboon, aardvark, etc. Lions, at one time numerous, are not now to be met with in the colony, nor is the giraffe. The birds include vultures, eagles, and other *Raptores* (the most remarkable of which is the serpent-eater), pelicans, flamingoes, and most important of all, the ostrich, now bred as a domestic animal for the sake of its feathers, those plucked from an adult bird in a season being sometimes worth from $50 to $90. Other native animals are large snakes, the venomous cobra di capello, and the scorpion. Along the

coast whales and seals abound, and salt- and fresh-water fish are plentiful.

The colony is better adapted for pasturage than for agriculture, but wheat, maize, and other cereals can be grown almost everywhere, the only drawback to their cultivation being the want of moisture in certain localities and in certain seasons. In some years a surplus of grain is left for exportation; in others grain has to be imported. All kinds of European vegetables and pot-herbs, and all the fruits of temperate climates, such as apples, pears, plums, peaches, melons, apricots, walnuts, almonds, oranges, limes, etc., thrive excellently, and fruits, dried and preserved, are exported. The vine is cultivated, and some excellent wines (notably those of Constantia) are made. The colony is said to be particularly well suited for grape-culture, and the vines produce heavier crops than are known almost anywhere else. Viticulture, it is believed, is yet only in its infancy, though there are already over 90,000,000 vine-stocks. The colonial government has up to 1899 disposed of 128,000,000 acres of land, the quantity remaining undisposed of being 49,564,000 acres.

Sheep-raising is the most important industry, and wool the chief export (although surpassed in value by diamonds). The amount of this article exported to the United Kingdom in 1899 was 84,032,536 pounds. Most attention is now devoted to the breeding of pure merinoes, the consequence being a great improvement in the wool. Goats are also bred, both the native and the Angora, and the export of goats' wool or hair to Great Britain has increased from 102,570 pounds in 1868 to 12,948,574 pounds in 1899. Cattle-breeding is carried on to some extent, especially along the coasts and in the eastern and northern districts.

There are no manufactures of any importance, and consequently the imports of the colony consist largely of manufactured goods, chiefly from Great Britain. The total imports in 1898–9 were of the value of $83,652,000; in 1871 their value was $15,173,014; exports in 1898–9 amounted to $131,265,250, in 1871 to $16,422,083. The value of the gold exported in the year 1898–9 was $83,735,250; of diamonds, including those sent through the postoffice, $22,145,100. The total value of the diamonds exported from 1867 to 1898 was $226,800,000. The other exports of importance, besides wool, are ostrich feathers, copper ore, skins, and hides. The exports of merchandise to Great Britain in 1899 amounted to $45,274,887, the imports of British produce to $40,645,654. To facilitate the inland traffic numerous roads have been made (the lotal length within the colony proper amounting to 8,000 miles), while 2,700 miles of railway and 7,500 miles of telegraph have been opened. Lighthouses have been built round the coast, and harbor works constructed.

The coinage is that of Great Britain, as are also the weights and measures, except that for land the *morgen* = 2.116 acres is employed.

The constitution formed under the acts of 1853, 1865, and 1872 vests the executive in the governor (who is also commander-in-chief of the forces) and an executive council or ministry composed of certain office-holders appointed by the Crown. The legislative power is in the hands of a legislative council of 23 members, elected for seven years, over which the chief justice presides *ex officio*, and a House of Assembly of 95 members, elected for five years, representing the country districts and towns of the colony. The public revenue for 1897–8 was $34,979,292; the expenditure, $40,891,280; the public debt amounts to about $145,500,000. The revenue is chiefly derived from railways, customs duties, and taxes. Much the greater portion of the debt represents money spent on the construction of railways.

The European population consists in part of English, Scottish, and Irish settlers and their descendants, but the majority is of Dutch origin (see BOERS), with a considerable number of German origin. The colored people are chiefly Hottentots, Kaffirs, Bechuanas, Basutos, Griquas, Malays, and a mixed race, the offspring of black women and white fathers. The laborers are chiefly Hottentots and Kaffirs. The prejudices and ill feeling once subsisting between the different nationalities of which the population is made up are now fast disappearing. Education is advancing, though it is not compulsory. The returns show a steady increase in the numbers of children of all classes receiving instruction. For the higher education there are seven colleges, besides a university (at Cape Town) incorporated in 1873. The colleges have each a staff of instructors in classics, mathematics, science, etc., but the university is merely an examining and degree-conferring institution. The religious bodies in the colony with the greatest number of adherents are the Dutch Reformed Church, the Church of England, the Methodists, Independents, and Presbyterians, in the order here given. There is no Established Church.

The chief towns of the colony ranking after Cape Town are Port Elizabeth, Kimberley, and Graham's Town (qq.v.).

The Dutch, who had early fixed upon the Cape as a watering-place for their ships, first colonized it under Van Riebeek in 1652. Reducing the Hottentot inhabitants to slavery, or driving them beyond the mountains, they extended the Cape settlement over a pretty large area. But the colony was under the rule of the Dutch East India Company, and owing to their regulations, made very slow progress. It was captured by the British in 1795, restored at the Peace of Amiens (1802), and again taken in 1806, Sir David Baird being sent at the head of an expedition to take possession of it, and so prevent it from falling into the hands of the French. From this time it has remained in the possession of the British, to which it was formally assigned in 1815, along with Dutch Guiana, Holland receiving in return £6,000,000. It now began to advance in prosperity, but the progress of the colony was greatly retarded by the Kaffir wars of 1834, 1846, and 1851–3, the result of the depredations of this warlike race. Subsequently the area of the colony was gradually enlarged by the annexation of surrounding districts. The most important of these annexations were British Kaffraria (annexed 1866); Griqualand West (1876); Kaffraria proper, or the Transkeian districts (Transkei proper, Griqualand East, and Tembuland), including nearly the whole of the region between the Kei and the Natal border (1875–80); Pondoland (1894); and part of Bechuanaland (1895). Its most recent history has been connected with the war between Great Britain and the Boer republics. See BOERS; SOUTH AFRICAN WAR.

Cape Comorin, kŏm'ō-rĭn, the most southern extremity of the peninsula of Deccan, British India, in lat. 8° 5′ N., and lon. 77° 30′ E., forming a circular, low, sandy point, which is not discernible above the distance of 12 to 16 miles from the deck of a large ship. Eighteen miles north from the cape is a bold summit called Comorin Peak, the southern termination of the western Ghauts, which has, from a distance, been often taken for the cape itself. Within a short distance of the cape lies a rocky islet, high above water; and about three miles from this islet are a fort and a village, a few fishermen's houses, a church, and some ancient temples, being the remains of the once famous town of Cape Comorin.

Cape Diamond, the extremity of an abrupt promontory in the province of Quebec, Canada, at the junction of the St. Charles and St. Lawrence rivers. On the promontory stands the citadel of Quebec, and on the west and nearly on a level with the ramparts lie the Plains of Abraham. Here was gained in 1755 the memorable victory by the English under Wolfe, over the French under Montcalm.

Cape Disappointment, or **Cape Hancock,** a cape at the mouth of the Columbia River, forming the southwest point of the State of Washington, in lat. 46° 16′ N., and lon. 124° 2′ W. There is a lighthouse at this point with a fixed light.

Cape Ducato, doo-kä'tō, the southern extremity of Santa Maura, one of the Ionian islands. It is identical with the ancient promontory of Leucadia, commonly called the Lover's Leap, or Sappho's Leap. The famous Greek poetess, according to an ancient tradition, threw herself from the top of this promontory.

Cape Elizabeth, a headland projecting into Casco Bay, between Portland harbor in Maine and the Atlantic Ocean, in lat. 43° 33′ N., and lon. 70° 11′ W. The coast is rocky, made up of ledges of talcose slate, traversed by dikes of trap. There are two lighthouses on the outer point, which stand 300 yards apart, the lights being 140 feet above the sea.

Cape Espichel (probably the ancient *Barbarium Promontorium*), a cape on the western coast of Portugal, 121 miles southwest of Lisbon. It rises abruptly from the sea, and is crowned by a small chapel and a lighthouse.

Cape Farewell, the southern extremity of Greenland, at the eastern entrance to Davis Strait. A strong current sets around this cape, and continues north along the eastern coast of the strait.

Cape Faro, fä'rō, the northeast extremity of the island of Sicily, known to the ancients as *Pelorus*. It is at the narrowest part of the strait of Messina, opposite the rock of Scylla on the coast of Italy.

Cape Fear, the south point of Smith's Island, near the mouth of Cape Fear River, N. C. About one mile from the shore stands Bald Head lighthouse.

Cape Fear River, a river of North Carolina; navigable for steamboats for 120 miles from its mouth. Its length, including one of the head branches, is about 300 miles. Formed by the junction of the Deep and Haw rivers, its course is generally southeast till it reaches the Atlantic Ocean. This is the largest and most important river which lies wholly within the State.

Cape Finistere, fĭn-ĭs-tār', the westernmost point of Spain, in the province of Corunna, extending southwest into the Atlantic, in lat. 42° 54′ N., and lon. 90° 21′ W. Several naval battles were fought off this cape.

Cape Flattery, the most westerly point of the State of Washington, at the entrance to the Strait of Juan de Fuca, in lat. 48° 23′ N., and lon. 124° 44′ W. On the island of Tatoosh, opposite the cape, there is a lighthouse.

Cape Florida, the southern extremity of Biscayne Key off the southeast coast of Florida, at the north entrance to Biscayne Bay, in lat. 25° 39′ N., and lon. 80° 9′ W. There is a lighthouse on the shoals opposite this point.

Cape Foulweather, a cape projecting into the Pacific Ocean from the coast of Oregon, in lat. 44° 50′ N., and lon. 124° 5′ W.

Cape Fox, or **Lalande's Dog,** a peculiar canine animal (*Otocyon lalandii*), differing from other dogs principally in the possession of an additional molar in each jaw. Other characters in the structure of the jaw and dentition suggest that *Otocyon* is a persistent creodont-like form, which has developed from a primitive arctoid stock in a direction curiously parallel to that of the true dogs. No other mammal outside the marsupial order ever has four molar teeth in both jaws, and this may indicate a still more remote marsupial ancestry. This wild dog is generally found in open country, dwelling among small bushes in pairs, exceedingly shy, and not gathering into packs. It is rather smaller than a fox and resembles a fennec in having enormous ears and a thick, bushy tail. In general color it is brownish or iron gray, mottled with yellow and with the limbs nearly black.

Cape Frio, frē'ō (Port. *Cabo Frio,* "cool cape"), a promontory on the coast of Brazil, in the State of Rio de Janeiro. It forms the terminus of a range of mountains running parallel to the coast, and consists of a huge oval mass of granite. There is a lighthouse at this point.

Cape Froward, the southern extremity of the continent of South America, lying northwest of Cape Horn, in lat. 53° 53′ S., and lon. 71° 18′ W. It is a bold promontory of dark slaty rock.

Cape Gaspé. See GASPÉ.

Cape Gata, gä'ṭa, or **Cape de Gatte,** a promontory of Spain, on the coast of Granada, 24 miles in circuit and 13 miles broad. It was formerly a resort of Moorish pirates.

Cape Girardeau, jē-rär-do', Mo., a city of Cape Girardeau County; on the Mississippi River, the Illinois Cent., and the St. Louis, C. G. & F. S. R.R.'s; 150 miles southeast of St. Louis. It is the seat of St. Vincent's College and the Southeastern Missouri State Normal School, and has a national bank and several newspapers. Pop. (1900) 4,815.

Cape of Good Hope, a promontory near the south extremity of Africa, in lat. 34° 21′ S., and lon. 18° 3′ E., at the termination of a small peninsula extending south from Table Mountain, which overlooks Cape Town. This penin-

sula forms the western side of False Bay, and on its inner coast is Simon's Bay and Simon's Town, where there is a safe anchorage and a British naval station. Bartholomew Diaz, who discovered the Cape in 1487, called it Cape of Storms; but John II. of Portugal changed this to its present designation. It was first doubled by Vasco de Gama in 1497. Here is one of the principal astronomical institutions of the world. About the middle of the 16th century the French astronomer, Lacaille, made an exceedingly valuable series of observations at the Cape. Ever since the English have had a colony there they have kept up astronomical work, the Cape having been the scene of the labors of several celebrated English astronomers, among them Sir John Herschel.

Cape Grisnez, grē-nā, a headland of France in the department of Pas-de-Calais, the nearest point of the French coast to Great Britain. It has a revolving light 195 feet high.

Cape Guardafui, gwär-dä-foo-ē', or **Gardafui,** a cape on the east coast of Africa in Somaliland, situated in lat. 11° 50′ N., and lon. 51° 16′ E.

Cape Haitien, ä-ē-tē-ăń, or **Cape Haytien,** Haiti, a town on the north coast of the island. It was formerly known as Cap Français, Le Cap, or Guarico, the latter being the native name. It has an excellent harbor, but has declined in importance in recent years. Pop. about 29,000.

Cape Hat'teras, the easternmost point of North Carolina, a sandy insular spit, or narrow beach, separated from the mainland by the broad bay called Pamlico Sound. South of the capes of the Delaware, no land stretches so far out into the Atlantic as Cape Hatteras. The Gulf Stream, in its eastern and western vibrations, often flows within 20 miles of the cape, crowding toward the shore coasting vessels bound south. The difference of temperature between the hot airs of the Gulf and the breezes along shore and from the land engender frequent commotions in the atmosphere at this place; and no point on the coast is more noted for its frequent and dangerous storms. A lighthouse is kept a little over a mile north of the outermost point.

Cape Henlo'pen, a cape on the eastern coast of Delaware at the south side of the entrance to Delaware Bay, in lat. 38° 47′ N., and lon. 75° 5′ W.

Cape Henry, a cape on the coast of Virginia at the southern entrance of Chesapeake Bay. It has a fixed light 120 feet above the level of the sea.

Cape Horn, the southern extremity of an island of the same name, forming the most southerly point of South America. It is a precipitous headland, 500 to 600 feet high, and running far into the sea. Sailing vessels often encounter dangerous tempests in passing round the Horn; steamers generally pass through the Straits of Magellan. The cape was first doubled in 1616 by the navigator Schouten, a native of Hoorn, Holland, whence its name.

Cape Hunting-dog, a wild dog of Africa (*Lycaon pictus*), which is placed in a separate genus because it differs from all other dogs in having only four toes on each limb, in lacking one pair of molars in the upper jaw, and in certain other features. It resembles a hyæna in form, and is yellowish-gray, with irregular, black markings. It hunts in packs, and is one of the enemies most dreaded by all the African antelopes. Since the decrease of this, its natural game, it has played havoc with domestic cattle and sheep, and is killed off by the settlers wherever found.

Cape Island. See CAPE MAY, N. J.

Cape de la Hague, hāg (written also, but less correctly La Hogue), a headland of Normandy, France, opposite the island of Alderney, and forming the northwestern extremity of the peninsula of Cotentin, in the English channel. It is often confounded with Fort La Hogue or La Hougue, on the opposite side of Cotentin. Near this latter promontory the united English and Dutch fleets defeated the French, 19–24 May 1692.

Cape Linguetta, lĭn-gwĕt'ta, a headland of European Turkey, 2,290 feet high. It forms the termination of the Chimara, or Acroceraunian Mountains, and bounds the east entrance into the Adriatic.

Cape Lookout, a cape situated on an island off the southeast coast of North Carolina, in lat. 34° 37′ N., and lon. 76° 31′ W. There is a lighthouse at a considerable height above the sea.

Cape Lopa'tha, the southern extremity of Kamchatka. At the northern part of the headland is a mountain, bearing the same name, whence the land gradually slopes and narrows until it terminates in a low and barren tongue.

Cape Lopez, lō'pāth, the southern extremity of the Bight of Biafra, on the west coast of Africa. It is situated in lat. 0° 36′ S., and lon. 8° 44′ E.

Cape Matapan, mä-ta-pän', a promontory of Greece, forming the southern extremity of the Peloponnesus, in lat. 36° 23′ N., and lon. 22° 29′ E. The name *Tænarum,* or *Promontorium Tænarium,* was applied by the Greeks to the headland, and to the small peninsula north of it, connected with the great Taygetic peninsula by a narrow isthmus.

Cape May, N. J., a city and watering place in the southern part of Cape May County, having good railroad and water communication. It has a fine beach and is very popular as a seaside resort, providing accommodations in hotels and boarding-houses for guests 10 times exceeding in number the permanent inhabitants. The place is sometimes called Cape City or Cape Island City. Pop. (1900) 2,257.

Cape May, the southern extremity of New Jersey, at the entrance to Delaware Bay, situated in Cape May County, in lat. 38° 56′ N., and lon. 74° 57′ W. It has a revolving light about 150 feet above sea-level.

Cape Mendocino, měn-dō-sē'no, the westernmost point of the coast of California, projecting into the Pacific Ocean in lat. 40° 26′ N., and lon. 124° 25′ W. It has a very high lighthouse with a flashing light.

Cape Ned'dock, Maine, a promontory 35 miles southwest of Portland, with a lighthouse on Goat Island near it, containing a fixed light, 33 feet above the sea.

Cape Nome, nōm, a cape on the south coast of the peninsular projection of Alaska, which separates Kotzebue Sound on the north

from Bering Sea on the south, and terminates on the west in Cape Prince of Wales. In the vicinity of the cape is a remarkably rich gold mining region. In a direct line of navigation, it lies about 2,500 miles northwest of Seattle, and 175 miles southeast of Siberia. The nearest settlement of consequence, prior to 1899, was St. Michael, 100 miles to the southeast, the starting point of the steamers for the Yukon River; but during the year various aggregations of mining population had built themselves up in closer range and reduced the isolation from the civilized world by some 60 miles. The Nome district as settled centres about the lower course of the Snake River, an exceedingly tortuous stream in its tundra course, which emerges from a badly degraded line of limestone, slaty, and schistose mountain spurs, generally not over 700 to 1,200 feet elevation, but backed by loftier granitic heights, and discharges into the sea at a position 13 miles west of Cape Nome proper.

The first discovery of gold was made in September 1898, when a party of Swedes found it on the creeks and the gulches. It was not until July 1899 that the beach gold was discovered. In the middle of October following, Nome City had 5,000 inhabitants all living in tents on the hitherto barren shore. The rapidity of the growth of this town has probably never been equaled. The region is wholly within American territory, and early prospecting indicated that it would rival in richness the famous Klondike district. During the season of 1901 $7,000,000 in gold was taken from the Cape Nome region.

Cape North, the northeast point of Cape Breton, projecting into the Gulf of St. Lawrence.

Cape North, or **Otoo, Otou,** a peninsula at the northern extremity of New Zealand, about two miles long, and terminating in a bluff head flat at the top.

Cape North, northernmost promontory of Europe. See NORTH CAPE.

Cape Nun, noon, a headland on the west coast of Morocco, extending into the sea at the southwestern extremity of the Atlas range, in lat. 28° 45′ N., and lon. 11° 5′ W.

Cape Ortegal, ôr-tā-gäl′, a rugged promontory forming the northern extremity of Spain, extending into the Bay of Biscay, in lat. 43° 45′ N., and lon. 7° 56′ W.

Cape Pal'mas, a cape on the western coast of Africa, situated in the southern part of Liberia, in lat. 4° 22′ N., and lon. 7° 44′ W.

Cape Petrel, or **Cape Pigeon,** a large petrel (*Daption capensis*), about the size of a pigeon, exceedingly numerous about the Cape of Good Hope, and widely distributed throughout the Southern Ocean.

Cape Pillar, a high mass of rocks terminating in two tower-shaped cliffs on the northwest coast of Tierra del Fuego, at the southwest entrance from the Pacific Ocean into the Straits of Magellan.

Cape Poge, a cape on the coast of Massachusetts, in lat. 41° 25′ N., and lon. 70° 26′ W. It has a lighthouse with a fixed light.

Cape Prince of Wales, a promontory on Bering Sea, the most northwest point of North America. It terminates in a peaked mountain, presenting a bold face to the sea, and is a dangerous point on account of a shoal which stretches to the northeast.

Cape Race, a promontory at the southeastern extremity of Newfoundland, in lat. 46° 39′ N., and 53° 4′ W. The fogs of this part of the coast make navigation hazardous. The British government maintains a light here.

Cape River, or **Rio de Segovia,** known also as Coco or Wanx, a river of Nicaragua, Central America, which after a generally northeast course of nearly 300 miles enters the Caribbean Sea at Cape Gracias a Dios. It is navigable for a considerable distance from the sea, but the upper part of its course is obstructed by cataracts and shallows. It forms part of the boundary between Honduras and Nicaragua.

Cape Romain′, a low and barren point of land, with a lighthouse, 37 miles northeast of Charleston, S. C.

Cape Sable, the name of two capes in North America: (1) The southernmost point of the mainland of the United States at the extremity of Florida, in lat. 25° 8′ N., and lon. 81° 9′ W. (2) A point at the southwest extremity of Nova Scotia, in lat. 43° 23′ N. and lon. 65° 37′ W.

Cape San Antonio, sän än-tō′nē-ō, the name of two capes: (1) A high, barren, and precipitous headland, on the coast of Valencia, Spain. On its summit are a convent, a watch tower, and several windmills. (2) A lofty and nearly perpendicular promontory, at the mouth of the Rio de la Plata, in the territory of Buenos Ayres.

Cape San Blas, sän blä, a low point of land, about two miles long, on the south coast of Florida, 123 miles east-southeast of Pensacola. It has a revolving light 65 feet high.

Cape San Lucas, loo′kăs, the southern extremity of the peninsula of Old California, in lat. 22° 44′ N., and lon. 109° 54′ W.

Cape St. Roque, rō′kā, **San Roque,** or **São Roque,** a cape on the east coast of Brazil, in lat. 5° 29′ S., and lon. 35° 14′ W. See BRAZIL.

Cape St. Vincent, a headland at the southwestern extremity of Portugal, in lat. 37° 3′ N., and lon. 8° 58′ W. Off this cape, 14 Feb. 1797, an English naval force, consisting of 15 ships of the line, under Admiral Jarvis, defeated a superior Spanish fleet. This point was known to the ancients as *Promontorium Sacrum.*

Cape Spartiven'to, the ancient *Herculis Promontorium,* a promontory of southern Italy, forming the southeastern extremity of Calabria, in lat. 37° 57′ N., and lon. 16° 5′ E.

Cape of Storms. See CAPE OF GOOD HOPE.

Cape Tindaro, tĭn-dä′rō, a headland of Sicily, extending into the Gulf of Patti. The remains of the ancient Tyndaris are in its neighborhood.

Cape Town, Africa, capital of the Cape Colony, situated in the midst of striking scenery, rather more than 30 miles from the Cape of Good Hope, at the head of Table Bay, which opens into the Atlantic on the northwest, and at the foot of Table Mountain. It is regularly laid out and has some good streets, with well-

built business premises and other buildings, and is furnished with most of the institutions and conveniences of a European town (including tramways). The finest edifice is that which accommodates the legislature, a handsome structure of modern erection; another good edifice is that containing the public library (40,000 volumes) and museum, in the Roman-Corinthian style. The Standard Bank of South Africa also occupies handsome premises. Other buildings are the government house, the courts and government offices, the town house, the gallery of fine arts, the railway station, the post-office, the exchange, etc. The best ecclesiastical building is the Roman Catholic Cathedral; there is also an English Episcopal Cathedral, and Dutch, Presbyterian, Lutheran, Independent, and Methodist churches. There is a well-equipped college, the South African College, which trains students for the degrees of the Cape University, which is merely an examining body. There are beautiful botanic or government gardens in the town, occupying 14 acres, and forming a fine promenade. The Cape Observatory is a celebrated institution supported by imperial funds. A railway runs from Cape Town into the interior of the colony, connecting the town with the Orange Free State and Transvaal. The port has been provided with a breakwater 3,554 feet long, inside of which ships can safely ride at anchor protected from the northwest gales; and there are two docks 16 acres in area, an outer harbor of 62 acres, a large graving dock, etc. The population is very mixed, a large number consisting of colored people of negro or other African descent. About 14,000 are Malays, descendants of those who were brought from the Dutch East Indies; they constitute the chief fishing and working population of the town and environs. They number altogether about 86,000, more than half of the whites being of Dutch descent.

Cape Trafalgar, trăf ăl gär, or trā-făl'gär, a headland on the coast of Cadiz, Spain. It is memorable for the naval battle fought near it, 21 Oct. 1805, between the English under Nelson, and the combined fleets of France and Spain. The English gained a complete victory, though with the loss of their commander. It was known to the Romans as *Promontorium Junonis.*

Cape Verde, the most westerly headland of Africa in Senegal, jutting out into the Atlantic Ocean, between the rivers Gambia and Senegal, in lat. 14° 43′ N., and lon. 17° 30′ W. It was discovered by the Portuguese navigator, Fernandez, in 1445, and is said to have derived its name from a group of gigantic baobab trees adorning its summit.

Cape Verde Islands, a group of islands west of Africa, in the Atlantic Ocean, so called from Cape Verde, opposite to which they are situated; 320 miles west of Cape Verde, and between lat. 15° and 18° N. They belong to Portugal. As to their number, some reckon 10, others 14 or more, by giving the name of islands to masses which are only rocks. They are, in general, mountainous. The island of Fogo, one of the group, consists of one single mountain, a volcano, sometimes active, about 10,000 feet above the level of the sea. Some of the islands are very bare; in others the lower hills are covered with a beautiful verdure, as well as the valleys between; but there is little water, except what is found in ponds and wells. Long droughts have occurred, sometimes causing great loss of life. The climate is hot and unhealthy in most of the islands. The soil is, for the most part, not very fertile; nevertheless, some parts produce sugar, coffee, rice, maize, etc., with bananas, lemons, oranges, citrons, grapes, and other fruits. The total population amounts to about 148,000, of whom about 4,000 are white, the rest being chiefly negroes. The chief town is Porto Praya on São Thiago (Santiago), and Porto Grande on São Vicente is a coaling station for steamers. Salt is an export of importance. Coffee, hides, and physic-nuts are also exported.

Cape Wrath, a pyramidal promontory of unrivaled wildness and grandeur, forming the northwest extremity of Scotland and running out into the Atlantic; in lat. 58° 38′ N., and lon. 4° 58′ 5″ W. It presents deep fissures and tall pinnacles. From it a reef of rocks, perforated with arches and caverns, juts out into the sea. Off the cape is Stag Rock, a pillar 200 feet high. Cape Wrath is 600 feet high, and there is a lighthouse near it, 400 feet above the sea, visible 25 miles off.

Capecelatro, Alphonse, äl-fôńs kā-pā-chĕ-lätrō, CARDINAL, Italian pietist biographer and controversialist: b. Marseilles, 5 Feb. 1824. He has won distinction as Italy's leading contemporary Church writer, with a 'History of St. Catherine of Siena and of the Papacy of Her Day' (1856); 'The Errors of Renan'; a 'Life of Jesus'; and a 'Life of St. Philip of Neri' (1882).

Capefigue, Baptiste Honoré Raymond, bäp-tēst ō-nō-rā rā-mōń käp-fēg, French historian and journalist: b. Marseilles, 1802; d. Paris, 23 Dec. 1872. His contributions to historical science are the 'History of Philip Augustus' (1829); and 'History of the Restoration and of the Causes that Led to the Fall of the Elder Branch of the House of Bourbon' (1831–3).

Cap'el, Arthur, LORD, English soldier: b. about 1610; d. 9 March 1649. He was son of Sir Henry Capel; was raised to the peerage as Lord Capel, of Hadham, by Charles I. in 1641. During the revolutionary war he fought bravely as one of the royalist generals in the west in the engagements at Bristol, Exeter, and Taunton. Having been at length forced to surrender at Colchester to Gen. Fairfax, he was imprisoned, and after some vicissitudes, executed. His 'Daily Observations or Meditations' was published posthumously with a memoir.

Capel, Arthur, VISCOUNT MALDEN and EARL OF ESSEX, English statesman, son of the preceding: b. January 1631; d. July 1683. In 1661 he was created Viscount Malden and Earl of Essex and appointed ambassador to Denmark in 1670. He served as lord-lieutenant of Ireland, 1672–7, and was for a few months in 1679 head of the treasury commission. Arrested for his connection with the Rye House Plot, was sent to the Tower, and is supposed to have committed suicide there.

Capel, Thomas John, MONSIGNOR, English Roman Catholic ecclesiastic: b: London, 28 Oct. 1835. He was educated at the Roman

Catholic College at Layston and was ordained to the priesthood in 1860. He devoted himself to education, establishing a Roman Catholic public school at Kensington in 1873, and was given the title of Monsignore by Pope Pius IX. He came to the United States in 1883, and after a lecture tour settled to private life in California. He is the author of 'The Holy Catholic Church'; 'Confession'; 'The Name Catholic'; 'The Pope the Head of the Church.' As Catesby he is supposed to be portrayed in Disraeli's 'Lothair.'

Ca'pel, or **Ca'ple,** a term used by miners to indicate the wall of a lode, especially in a tin or copper mine. It is generally of quartz, black tourmalin, and hornblende. The capels sometimes contain sufficient metallic particles to make it worth while to work them. In these cases they may be considered as forming part of the lode. The word "cab" is an equivalent used by Cornish miners. In the United States, "casing" is nearly synonymous.

Capeline, or **Capelline,** a small piece of armor, consisting of a skull cap of iron, worn in the Middle Ages by light armed men such as archers.

Cap'ell, Edward, English Shakespearean scholar: b. Throston, Suffolk, 1713; d. London, 24 Feb. 1781. He was deputy inspector of plays, and published 'Mr. William Shakespeare, His Comedies, Histories, and Tragedies'; 'Notes and Various Readings of Shakespeare'; and 'The School of Shakespeare.'

Capel'la, Martianus Mineus Felix, Latin writer of the 4th century: b. probably in Africa. His extant work, 'Satiricon,' consists of nine books, the first two under the title, 'De Nuptiis Philologiæ et Mercurii,' being an introductory allegory, while the others treat of grammar, logic, metaphysics, geometry, arithmetic, astronomy, and music. His statement of the heliocentric system of astronomy in the eighth book may possibly have given hints to Copernicus, who quotes him occasionally.

Capella, a star situated in the constellation Auriga, on the "Charioteer's" left shoulder. It is of remarkable brilliancy, only four stars exceeding it in that respect. Its color is nearly that of solar light.

Capellini, Giovanni, jō-vän'nē kä-pĕl-lē'nē, Italian geologist and paleontologist: b. Spezia, 13 Aug. 1833. He studied at Pisa, and traveled widely. In 1860 he became professor at Genoa, and later at Bologna. He has emphasized the importance of prehistoric discoveries which related archæology to paleontology and defended the Darwinian theory. He was influential in calling the International Congress of Anthropology and Prehistoric Archæology in 1865.

Capello, Bianca, bē-änk'ä kä-pĕl'lō, Italian adventuress: b. Venice, 1542; d. in the Castle Paggio di Capano, 11 Oct. 1587. In 1563 she eloped with a banker's clerk named Pietro Buonaventuri, who put himself under the protection of Francesco de Medici at Florence. The latter made Bianca his mistress and her husband his steward, but had him put to death in 1570, and after the death of his wife, Joanna of Austria, married Bianca in 1578. She and Francesco are supposed to have been poisoned by his brother and successor, Cardinal Fernando.

Capello, Hermengil'de, Augus'to de Brito, brē'tō, Portuguese African explorer: b. Lisbon, 1839. He entered the navy in 1858, and rose to the rank of captain. In 1877–9 he, with Robert Ivens, conducted an expedition which explored the sources of the Kuanga. In 1885 he set out on a second expedition with Ivens, traveling through the southern part of Africa from Mossamedes to Mozambique, thus exploring the sources of the Congo and the Zambesi, a country almost entirely unknown before. He wrote with Ivens 'De Benguella a sterras de Jacca' (1881); and 'De Angola a Contra-Costa' (1886).

Capen, Elmer Hewitt, American educator: b. Stoughton, Mass., 5 April 1838. He graduated at Tufts College in 1860, and was elected to the Massachusetts legislature while still an undergraduate, 1859. After studying at the Harvard Law School, he was admitted to the bar, and practised at Stoughton for a short time; began the study of theology, became a Universalist clergyman, held pastorates at Gloucester, Mass., and Providence, R. I., 1865–75, when he was elected president of Tufts College, a position he still holds. His administration has been most successful in every way, and under him the institution has grown to be one of the most progressive of American colleges. A limited edition of his addresses has appeared, entitled 'Occasional Addresses' (1902).

Ca'pen, Nahum, American historical writer: b. Canton, Mass., 1804; d. 4 Jan. 1886. He was postmaster of Boston, Mass. (1857–61); introduced street letter-box collections; wrote 'The Republic of the United States'; 'History of Democracy' (1874); etc. He also wrote and edited works on phrenology.

Capen, Samuel Billings, American missionary commissioner: b. Boston, Mass., 12 Dec. 1842. He was educated in the public schools, and after leaving the English High School in 1858 entered the carpet store in which he became a partner in 1864. He is best known to the public through his close association with the missionary work of the Congregational Church. He was president of the Boston Municipal League, 1894–9; of the Congregational Sunday School and Publishing Society; and served most effectively as president of the American Board of Commissioners for Foreign Missions.

Capercailzie, kăp-ĕr-kā'lĭ, **Capercaillie,** or **Cailzie,** kā'lĭ, a readily domesticated, polygamous grouse (*Tetrao urogallus*), about the size of a turkey, widely distributed throughout the pine-covered mountains of Europe. Formerly it inhabited Ireland and Scotland, where it was known as "blackcock," but it was entirely extirpated toward the end of the 18th century. It has since, however, in small numbers, been restored to Scotland by stock imported from Scandinavia. The ground color of the cock is muddy black, spotted with gray and brown; quill feathers dark brown; tail feathers nearly black; a glossy dark green chest; whitish bill and a small patch of naked skin above the eye, which is scarlet. The feet are feathered to the toes. The hen and young are dark brown, covered with freckles of a lighter shade; neck and chest yellowish chestnut, and the feathers of the under part usually edged with white. It

feeds chiefly upon berries, seeds, insects, and the young shoots of the pine and other trees, which give its flesh a delicate turpentine flavor. They are hunted with the aid of dogs, which "tree" them, when they are easily shot. In the early spring, at the approach of the breeding season, the cocks meet at an accustomed place to give the hens the benefit of their annual "dances," at which assemblies the hens seem to choose their mates by the amount of plumage, color, daring, and extraordinary gestures which each displays. On such occasions the cock is oblivious to all else save the winning of his mate, and may easily be approached and killed. The female bird builds her nest on the ground among the pines, generally laying from 6 to 12 eggs, few of which reach maturity, owing to the carelessness of the mother. They are spotted red or yellowish brown, and are over two inches long. Consult: Lloyd, 'Game Birds of Sweden and Norway'; Morris, 'British Game Birds'; and Darwin, 'Descent of Man.'

Ca'pern, Edward, English minor poet: b. Tiverton, Devonshire, 29 Jan. 1819; d. 1894. He was long in the mail service in his native county, and was often styled "The Postman Poet." The poet Landor, attracted by the verse of Capern, procured him a pension from the civil list. His published works include: 'Poems by the Biddeford Rural Postman'; 'Ballads and Songs'; 'Wayside Warbles'; 'Sun-gleams and Shadow Pearls.' His verse is mainly descriptive of Devon life and character and several of his lyrics were set to music by the poet himself.

Caper'naum, a city of ancient Palestine, on the west or northwest side of the Sea of Tiberias. This place is famous in Christian history, because Jesus often visited it during the time of his ministry, and in its vicinity he delivered the Sermon on the Mount. Nothing of the city now remains.

Ca'pers, Ellison, American Protestant Episcopal bishop: b. Charleston, S. C., 14 Oct. 1837. He graduated at the South Carolina Military Academy 1857, and was a professor there, 1858–60. He entered the Confederate army, was successively major, lieutenant-colonel, and brigadier-general, and received severe wounds at Jackson, Miss., Chickamauga, and Franklin, Tenn. He was secretary of State of South Carolina in 1867–8, then entered the Protestant Episcopal ministry, and was rector of Christ Church, Greenville, S. C., for 20 years, and at Columbia, S. C., for six years. In 1893 he was consecrated seventh bishop of South Carolina.

Capers, the unopened flower-buds of a low shrub (*Capparis spinosa*), which grows from the crevices of rocks and walls, and among rubbish, in the southern parts of France, in Italy, and the Levant. The stems of the caper-bush are trailing, and two or three feet long. In the south of France the caper-bush is very common. It grows wild upon the walls of Rome, Sienna, and Florence, and, when trained against a wall, flourishes even in the neighborhood of Paris. It was introduced into Great Britain as an exotic as early as 1596. Modern horticulturists are of opinion that with care it might be raised in the open air in England, but this has never been accomplished to any practical extent. It is cultivated on a large scale between Marseilles and Toulon and in many parts of Italy. In the early part of summer it begins to flower, and the flowers continue successively to appear until the commencement of winter. The buds are picked every morning before the petals are expanded; and as they are gathered they are put into vinegar and salt. When a sufficient quantity is collected they are distributed, according to their size, into different vessels, again put into vinegar, and then packed up for sale and exportation. The smallest capers are the dearest, simply from the reason that they are more troublesome to gather. This pickle is much used in sauce for boiled mutton. To persons unaccustomed to it the taste of capers is unpleasantly sharp and bitter, but after a little while the palate becomes reconciled to it. The flower-buds of the marsh-marigold (*Calthapalustris*) and the seeds of nasturtiums are frequently pickled and eaten as a substitute for capers. The bark of the root of the caper, cut into slices and dried in small rolls or quills, is sometimes used in medicine as a diuretic and in cases of obstruction of the liver.

Capes, Bernard, English novelist. His works include: 'The Lake of Wine' (1898); 'The Adventures of the Comte de la Muette' (1898); 'Our Lady of Darkness'; 'At a Winter's Fire' (1899); 'From Door to Door' (1900); 'Joan Brotherhood' (1900); 'Love Like a Gipsey' (1901); 'Plots' (1901). The majority of these have been republished in the United States.

Capes, William Wolfe, English historical writer. He has published: 'The Early Roman Empire'; 'Roman Empire in the 2d Century' (1876); 'University Life in Ancient Athens' (1877); 'Livy' (1879); 'Stoicism' (1880); 'History of the Achæan League,' a translation from Polybius (1888); 'The English Church in the 14th and 15th Centuries'; 'Rural Life in Hampshire.'

Capet, kā-pā, or kăp'ā, the name of the French race of kings, which has given 118 sovereigns to Europe, namely, 36 kings of France, 22 kings of Portugal, 11 of Naples and Sicily, 5 of Spain, 3 of Hungary, 3 emperors of Constantinople, 3 kings of Navarre, 17 dukes of Burgundy, 12 dukes of Brittany, 2 dukes of Lorraine, and 4 dukes of Parma. The history of this royal race is, at the same time, the history of the rise and progress of the French monarchy. The fate of one of the most interesting countries and nations in Europe is connected with the name of Capet. After having been deprived of four thrones, and again restored to them, this family stood forth as the first and most ancient support of the European principle of political legitimacy, that divine right, which in this house commenced with treason. Its origin is remarkable. Pepin the Short, the father of Charlemagne and mayor of the palace under the Merovingian dynasty, had displaced that royal house, and usurped the throne of the ancient kings of the Franks. After a space of 235 years his own descendants, the Carlovingian monarchs, experienced a similar fate. Under the last Carlovingians, destitute alike of energy and wisdom, Hugh the Great, Duke of France (by which was then understood the Isle of France), Orleans, and Burgundy, exercised a power as unlimited as that of the mayor of the palace under the Merovingians. On the death of Louis V., without children, in 987 his uncle,

Charles, Duke of Lower Lorraine, laid claim to the throne, which the Franks had sworn to preserve to the family of Charlemagne. The French nobility, disgusted at the German leanings of the Carlovingians, whose domains and influence lay in the eastern provinces, preferred that a member of their own class, whose possessions were situated in the centre of the country, and whose power was so great as to outrival that of the old dynasty, should rule over them, and accordingly chose as their king Hugh, son of Hugh the Great, Duke of France and Count of Paris, and had the support of the Church in their favor. The valiant Charles of Lorraine was surprised in Laon by the treachery of a bishop, and made prisoner. He died soon afterward in prison, and his son, Otho, Duke of Lower Lorraine, died in 1006. Both his younger brothers died childless in Germany. Thus the race of Capet was left in possession of the throne of France. According to some historians, Hugh Capet was descended from a Saxon family. He was married to a German princess, Adelaide, daughter of King Henry I. of Germany (Duke of Saxony). Hugh was crowned at Rheims, and swore to preserve to the nation, and particularly to the powerful feudal nobility and clergy, all their existing privileges. By his wise measures he gave permanence to his dynasty, which, next to the family of Guelph, is the oldest royal line at present existing. Hugh and the succeeding monarchs, till Louis VII., took the precaution to have their successors invested with the royal title during their own lifetime. Thus Hugh had his son, Robert, crowned and anointed as his colleague as early as 1 Jan. 988. He abolished by law the partition of the hereditary estates among the sons of the kings and forbade the alienation of the family domains. The daughters of the kings were endowed from that time with money, and the appanage which was given to the princes of the blood returned to the crown in default of male heirs. Both these principles were more fully confirmed by later laws. Thus Hugh Capet, by uniting his hereditary duchy, consisting of Paris, Isle de France, and Burgundy, inalienably with the crown, may be regarded as the founder of the French monarchy. What he had begun was completed by his successors, particularly in the times of the Crusades, and by the establishment of standing armies. On the failure of the direct line at the death of Charles IV., the French throne was kept in the family by the accession of the indirect line of Valois, and in 1589 by that of Bourbon. Capet being thus regarded as the family name of the kings of France, Louis XVI. was arraigned before the National Convention under the name of Louis Capet.

Cap'grave, John, English historian: b. Lynn, Norfolk, 1393; d. there, 1464. The most of his life was passed in the Augustinian friary of his native place. He was provincial of the order of Austin Friars in England, and was one of the most learned men of his day. He wrote in Latin numerous commentaries, sermons, and lives of the saints. His most important work was his 'Chronicle of England,' in English, extending from the creation to the year 1417. Other works were a 'Liber de Illustribus Henricis' and a 'Life of St. Katherine.' Many of his works are lost, others have never yet been printed. His 'Chronicle' and his 'Liber de Illustribus Henricis' have been printed in the Rolls series.

Caphtor, kăf'tŏr, the country in which the Philistines originated; mentioned in Deut. ii. 23; Jer. xlvii. 4; and Amos ix. 7. The location of Caphtor is not certain; it has been variously identified with Cappadocia, Cyprus, Crete, and Cilicia. It is most generally supposed to have been Crete, on account of the frequent connection of the Philistines with the Cherethites (or Cretans).

Capias, kāp'ē-ăs («that you take»), a writ or process whereby the sheriff is ordered to arrest the body of the defendant. The writ so framed as to call for the arrest of the defendant before judgment, in order to compel him to answer to a suit, is called a *capias ad respondendum;* if after the judgment, to compel him to satisfy the judgment, it is called a *capias ad satisfaciendum,* commonly abbreviated *ca. sa.* In case of injuries without force, the civil law, and originally the common law, did not authorize the arrest of the defendant before judgment, that is, the arrest to answer; and upon feudal principles, says Sir William Blackstone (3 Com. 281), «the person of a feudatory was not liable to be attached for injuries merely civil, lest thereby the lord should be deprived of his services.» The first writ of *capias ad respondendum* was given by act of Parliament in 1267, 52 Hen. III, c. 23, § 1, which provided that «if bailiffs, which ought to make account to their lords, do withdraw themselves, and have no lands nor tenements whereby they may be distrained, they shall be attached by their bodies, so that the sheriff shall cause them to come to make their account.» This act applied to a particular description of receivers, and supposed them not only to be debtors, but also to have in their own hands the evidence of the amount of the debt, the production of which was one object of the process. The statute of 13 Edw. I., c. 11, passed in 1285, 18 years after the former, extends this process to «all manner of receivers bound to yield account,» and provides «if they be found in arrearages upon this account, their bodies shall be arrested, and, by the testimony of the auditors, shall be sent into the next jail, and be imprisoned in irons under safe custody, and remain in prison at their own cost until they have satisfied their master (the creditor) fully of their arrearages.» It would appear that the practice of arresting on mesne process, that is before judgment, to answer in civil suits, grew out of these statutes; for the subsequent statutes of 25 Edw. III., c. 17 (1350), providing that «such process shall be made in writ of debt, detinue of chattels, and taking of beasts, by writ of *capias,* as is used in writ of account»; and of 21 Hen. VII., c. 9 (1503); evidently have reference to an arrest to answer. Formerly, a writ upon which a suit was commenced was either a *capias,* distress, or summons; either the person of the defendant was seized, and (unless he was bailed) imprisoned until the trial, or his goods or lands were seized as a guarantee of his appearance to answer; and more often, in modern times, to obtain a lien to secure satisfaction of the judgment; or he was only summoned, that is, merely had notice that a suit had been commenced before such a court, by such a plaintiff,

and was to be heard at such a time. The commencement of an action by summons is now the usual course of procedure; recent legislation, and especially the practical abolition of imprisonment for debt, having greatly restricted the use of writs of *capias* of any kind. By the Debtors' Act, 1869 (32 & 33 Vict. c. 62), the writ of *capias ad satisfaciendum* is abolished, except in cases in which the defendant can pay, but will not. The same act provides that when a plaintiff has good cause of action against a defendant to the amount of £50 or upward, and the defendant is about to quit England, and the absence of the defendant from England will materially prejudice the plaintiff in the prosecution of his action, a judge may order the defendant to be arrested unless or until security be found.

Capillaries, kăp'ĭ-lā-rĭz, or kạ-pĭl'ạ-rĭz, the extremely minute blood vessels that make the connection between the arteries and the veins. They are extremely abundant, being present in practically all parts of the body and in enormous numbers. It is by means of the capillaries that most of the interchange of nutrition takes place in the various tissues of the body. The arteries bring the fresh oxygenated blood to the parts, to which it is distributed by the rich network of capillaries, through the walls of which the waste products pass and are carried on by the blood pressure into the veins, to be eliminated by some one of the large excretory organs, the liver, etc., or carried to the lungs to be thus modified or cast off. The arrangement, width, and capacity of the capillaries varies in every tissue of the human body. In general they are arranged as a close network about the parts to which they are distributed, and in width they vary from one two thousandths to one two hundredths of an inch in diameter. See ARTERY; CIRCULATION.

Capillarity, in physics, the rise of a liquid in tubes of very fine diameter to a greater height than the surface of the fluid in which such tubes are immersed; together with certain kindred phenomena. If one end of a tube of this sort, open at both ends, be immersed in a fluid which adheres to glass, as water, the liquor within the tube will rise to a sensible height above the surface of that without. This phenomenon is explained by the attraction which exists between the glass and the fluid. Such liquids as do not adhere to glass (for example, quicksilver) do not rise in the tube; on the contrary, they stand lower within than without it. The mutual action of the elementary particles of matter, of which capillarity is a noted instance, gives rise to phenomena as interesting, and in certain cases as susceptible of being attached to theory by rigorous mathematical reasoning, as the phenomena of universal gravitation. The ascent of liquids in capillary tubes engaged much of the attention of experimental philosophers in the 18th century. Hauksbee found that the ascent of the liquid does not depend in any way on the thickness of the tube, and that when two plates, forming any small angle with each other, are plunged vertically into a fluid, the fluid which rises between them takes the form of an equilateral hyperbola; from which it followed that, in tubes of the same matter, the ascent of the liquid follows the inverse ratio of their interior diameters. In order to explain these facts succeeding physicists seem to have agreed in assuming the existence of a cohesive force among the particles of the liquid, and an adhesive force between the particles of the liquid and those of the tube. But these attractive forces can only be defined by their relative intensities at an equal distance, and the law according to which they diminish as the distance is increased. Now there are no data from which either their relative intensities or the law of their variation can be determined; we are, therefore, reduced to choose among a number of hypothetical laws, all equally possible; and the explanation, of course, depends on the particular hypothesis we adopt; hence the theories of Clairaut, Young, Laplace, and Poisson.

Clairaut was the first who attempted to reduce the phenomena of capillarity to the laws of the equilibrium of fluids, and exactly analyzed all the forces that concur to elevate the liquid in a glass tube. He showed that the portion of the liquid which is elevated in the tube above the exterior level is kept in equilibrium by the action of two forces, one of which is due to the attraction of the meniscus terminating the column, and the other to the direct attraction of the tube on the molecules of the liquid. Clairaut, however, regarded this last force as the principal one, and even supposed the attraction of the tube to extend as far as its axis; but this supposition is contrary to the nature of molecular forces, which extend only to insensible distances. The action of the tube has, in fact, no influence on the elevation or depression of the contained liquid, excepting in so far as it determines the angle under which the upper surface of the fluid intersects the sides of the tube. Neglecting, therefore, this force as insensible, there remains only the action of the meniscus to support the weight of the elevated column. But though Clairaut made an erroneous supposition respecting the nature of molecular action, and failed in the attempt to demonstrate from theory that the ascent of the liquid is inversely proportional to the diameter of the tube, he showed that a number of hypotheses regarding the law of attraction may be laid down, from any one of which that law of ascent may be deduced; and he demonstrated a very remarkable result, namely, that if the attraction of the matter of the tube on the fluid differs only by its intensity, or coefficient, from the attraction of the fluid on itself, the fluid will rise above the surrounding level when the first of these intensities exceeds half the second.

Young referred the phenomena of cohesion to the joint operation of attractive and repulsive forces, which in the interior of fluids exactly balance each other, and assumed the repulsive force to increase in a higher ratio than the attractive when the mutual distances of the molecules are diminished. From these considerations he was led to discover a very important fact in the theory of capillary action, namely, the invariability of the angle which the surface of the fluid makes with the sides of the tube.

Laplace published his theory of capillary attraction in 1806 and 1807, in two supplements to the Mécanique Céleste. Assuming the force of molecular action to extend only to imperceptible distances, he demonstrated that the form of the surface of the liquid is a principal

cause of the capillary phenomena, and not a secondary effect, and determined the part of the phenomena which is due to the cohesive attraction of the molecules of the fluid to each other, as well as that which results from their adhesion to the molecules of the tube. The separate consideration of the cohesive and adhesive forces leads to two equations, which comprehend the whole theory of capillarity — a general equation, common to all those points of the capillary surface of which the distance from the sides of the tube is greater than the radius of the sphere of molecular action; and a particular equation belonging to those points which are situated only at insensible distances from the surface of the tube, or are within the sphere of its action. This last equation will obviously express the angle which the surface of the meniscus makes with the sides of the tube; an angle which, as it depends only on the nature of the tube and that of the liquid, is constant and given in every case, the liquid and tube being supposed homogeneous. Laplace further supposes, in the case of elevation, that an infinitely thin film of the liquid first attaches itself to the sides of the tube, and thus forms an interior tube, which acts by its attraction alone to raise the column, and maintain it at a determinate height. The height of the column, consequently, depends on the cohesion and density of the liquid.

Poisson reinvestigated the whole theory of capillary attraction. Taking the most general case of the problem, he considers not merely the surface of a single liquid, but the surface formed by the contact of two liquids of different specific gravities, placed, the one above the other, in the same tube, and deduces the two equations which determine the form of the separating surface, and the angle under which it intersects the sides of the tube. These equations are in form the same as those of Laplace; but the definite integrals, which express the two constant quantities they include, are very different; and their numerical values would be so likewise, if these, instead of being determined experimentally, could be calculated *à priori* from the analytical expression. This, however, cannot be done without a knowledge of the law according to which the molecules of the liquid attract each other, as well as of that which regulates the action of the tube on the liquid. In applying his general solution to the explanation of the principal phenomena of capillarity, he took occasion to correct some inaccuracies of Laplace. The demonstration which Laplace had given of the invariability of the angle which the surface of the liquid makes with the sides of the tube was not altogether satisfactory; and he had even supposed that it changes its value when the liquid reaches the summit of the tube. Poisson demonstrated that the invariability of this angle will always be preserved, unless the curvature of the interior of the tube is infinitely great; or, in other words, unless its radius is infinitely small and of the same order of magnitude as the radius of the sphere of molecular action. Hence the angle cannot vary when the liquid reaches the summit of the tube; for, however small the radius of the tube may be, it is always incomparably greater than the radius of the sphere of molecular action.

The molecular forces which cause the elevation or depression of a fluid in fine tubes give rise also to numerous other interesting capillary phenomena. These are displayed at the surface of separation of two liquids, or of a liquid and a gas; sometimes even three fluids may be brought into simultaneous contact, and the phenomena then presented are very remarkable. In the midst of a liquid, the molecular attractions at any point being similar in all directions, and thus counterbalancing each other, may easily remain unnoticed. It is when an abrupt change produces want of symmetry in some direction that they become observable. They give rise, at the surface of separation of two fluids, to resultant forces that act just as would a stretched film containing the fluid; and the variations in these resultant forces causing a corresponding apparent variation in the contractile force of this imaginary film, occasion the phenomena we are about to describe.

The contractility of the film may be seen in the case of a little globule of mercury on a wooden table, or in the case of a soap-bubble. The mercury, instead of spreading itself out over the wood, as it might be expected to do on account of the weight of its parts, is gathered up into a little ball, just as if it were contained in an elastic bag. Again, if a soap-bubble be blown with an ordinary tobacco pipe, it may be shown, by bringing the mouthpiece near to a lighted candle, that the soap-bubble contracts with force enough to send a strong current of air backward through the stem.

The surface contractility is measured by the force required to draw out a band of it of unit breadth, or rather to prevent such a band from contracting. It has been ascertained that if we could cut out a band of the soap-and-water film an inch broad, a force of about six grains would be sufficient to hold it stretched. As there are two surfaces of the soap film, it follows that the superficial contractile force of soap and water exposed to air is about three grains per lineal inch.

M. Quinke, experimenting on this subject, found that the superficial tension for water is greater than for any other liquid that he tried. He determined the superficial tension of various liquids in contact with air, water, and mercury.

When two liquids, whose superficial tensions in air are not the same, are put in contact, both being also in contact with air, curious effects ensue. Thus when a pure water surface is touched with a glass rod that has been wetted with any kind of oil, the surface tension at the point is reduced, and the oil, with very remarkable motions, spreads itself out on the surface of the water. The well-known motions of light particles of camphor thrown on water are accounted for in the same way. This may be beautifully shown by means of an experiment devised by Prof. James Thomson of Glasgow, who first gave an explanation of the phenomenon known as the «tears of strong wine.» Let a very well cleaned glass plate be laid on a sheet of white paper, and moistened all over with slightly colored water. Then let a few very small drops of alcohol or spirits be thrown on the plate. The water film will be seen to draw away on all sides from the points where the drops fall owing to the weakening of the superficial tension at these points. The «tears of strong wine» are seen when wine, which contains water and alcohol, is allowed to evaporate in the air. The alcohol evaporates faster than

the water, and as it does so the superficial tension increases. This occurs rapidly in the thin layer of wine that adheres to the sides of a wine glass, and causes the film to be dragged from the places where the wine is strong to those where it is weak. Thus the film is seen to run up the sides of the glass, and then to collect into drops, which run down the side again.

Capilupi, Camillo, Italian poet: b. Mantua in the early part of the 16th century. He was the author of a work issued in 1572 entitled 'The Stratagem of Charles IX. against the Huguenots,' in which the Massacre of St. Bartholomew was justified, and made it appear that the action was premeditated. Cardinal Lorraine, who at the time was attending the Pope in Rome, endeavored to suppress the book from motives of policy.

Capistrano, Giovanni di, jō-vän'nĕ dē kä-pē-strä'nō, or **Capistranus, Johannes, Saint,** Italian monk: b. Capistrano, a small Neapolitan town of the Abruzzi, 24 June 1386; d. Illock, Slavonia, 23 Oct. 1456. He at first studied law, but in his 30th year, impelled by a vision, entered the Franciscan order, and was soon distinguished by the austerity of his manners, and a great zeal against the numerous heretical sects in Italy. The Popes Martin V., Eugene IV., and Felix V., often employed him as legate and inquisitor in suppressing the sect of the Fraticelli, which had spread widely over Naples and the Papal States. In 1444 he became vicar-general of the strict order of Franciscans called Observants, and in 1450 proceeded as legate to Germany with a view to suppress the Hussites, and rouse the Germans to a crusade against the Turks. His harangues in favor of a crusade against the Turks failing to make much impression on the German princes he resolved to try their effect on the populace, and easily persuaded great numbers to join him in marching against the Turks, who were advancing under Mohammed II., and had closely invested Belgrade, the key of Hungary, with an army of 150,000 men. At the instigation of Capistranus, John Corvinus Hunnyades furnished a force of 60,000, destroyed the Turkish fleet on the Danube, and threw into Belgrade succors both of men and provisions. On this expedition Capistranus in person commanded the left wing of the party, forced his way into Belgrade, repulsed a general assault by the Turks, and on 6 Aug. 1456, in conjunction with Hunnyades, signally defeated the whole Turkish host. His exertions, and the pestilential atmosphere caused by the dead bodies lying unburied around Belgrade, laid him on a sick-bed, and he died in the same year in the Franciscan monastery at Illock.

Capisuccchi, kä-pe-sook'kē, or **Capizucca, Biago,** or **Biasio,** MARQUIS OF MONTERIO, Italian general: b. Rome about the middle of the 16th century; d. 1613. He was in the service of Spain in the Low Countries, under the Duke of Parma, in 1584, afterward becoming lieutenant-general and commander of the army of Ferdinand I. de Medici, duke of Tuscany.

Capisucchi, Paolo, Italian ecclesiastic: b. Rome 1479; d. there 1539. Having become bishop of Neocastro he was summoned to Rome by Clement VII., who referred to him the question of a divorce between Henry VIII. of England and Queen Catherine. In this matter Capisucchi made a report against Henry.

Capital, in architecture the uppermost member of a column, that is to say, a separate piece of stone set upon the shaft and supporting an epistyle or the abutment of an arch — in short the mass of the building which is imposed upon the column.

A column must always have a shaft and a capital; without these features it would be a post, perhaps a pillar or a pier, but would have no architectural character. The capital, moreover, has generally received the most elaborate decorative treatment of the whole composition. Thus in Egypt, while the shaft might be cylindrical or conical, the capital would spread out immediately in curves either concave or convex, and would be carved and painted. It is even practicable to divide Egyptian columns into four orders by their capitals, which spread in different ways, and are ornamented by different sculpture, more or less imitative of nature. The idea of the spread given to the capital is, of course, that in this way the superstructure is taken more easily, as it is always and of necessity much larger horizontally than the column itself.

The stone uprights left in rock-cut temples in India and called ordinarily pillars, because of their varied forms — octagonal, square, and the like — are still divided into shaft and capital, though the forms of these are entirely remote from Egyptian or later European examples. Thus, some capitals consist of a mere enrichment of the uppermost band of the shaft and a superincumbent block very elaborately carved. In some cases this upper block gives off corbels and consoles which help to carry the roof by their greater spread.

The capitals which have excited the most interest among European students of art are those of the three Greek orders and of the five Renaissance orders which were deduced from the first three. The capital of the Grecian Doric is a reversed cone rounded off at top and carrying a square plinth or die; this plain *echinus* was richly painted in bright colors. The capital of the Ionic order is a curious device consisting of scrolls or volutes, two on each of the two opposite sides, so that this capital, almost alone, has not the same appearance from every point of view. The capital of the Corinthian order is a circular bell, surrounded by acanthus leaves and having at each corner a couple of projecting scrolls not unlike those of the Ionic order but small. This Corinthian order received many modifications in ancient Roman practice, and one of these was erected by the Renaissance men into a separate order, the so called Composite. From the Grecian Doric the Roman Doric took shape, and this was used by the Renaissance men, while a still simpler order was made from it and called the Tuscan. The capitals of these two orders are very thin and low in vertical measurement, and consist of moldings running round the continuation of the shaft, and either plain or slightly carved into the simplest of the egg and dart moldings or the like.

In mediæval architecture, both Romanesque and Gothic, the capitals are almost infinitely varied. The strong tendency of the time toward elaborate carving made this block of stone, from 5 to 20 feet above the aisles and in a prominent place, a most tempting vehicle for sculpture, and

the abandonment of the classical orders left every artist free to design his own system of leafage, animal forms and the like. In this way mediæval capitals are often of extraordinary beauty; but no attempt has been made to classify them except as they form part of a style. See COLUMN.

RUSSELL STURGIS.

Capital, in political economy, the accumulated wealth, in possession of individuals or of a community, which is available for use in further production. In estimating the capital of any individual we necessarily take into consideration the debts due to and from him; and many men of large capital are only possessed of claims upon others; their whole stock is in the hands of others at interest; and they have only promises for a certain amount of money, and actually possess neither lands nor goods to any considerable value; while others possess large quantities of both, and yet have little or no capital, since they owe in money the value of the greater part or the whole of their possessions. Now it is plain that no individual can undertake production, to any large extent, without an extensive stock. He must have land to cultivate, or materials to work up, and implements to work with. Even a savage must have a capital, such as his hut, clothes, cooking utensils, food enough to support him until he can obtain a new supply, and implements, such as a hatchet, gun, canoe, fishing gear, to procure this supply. The first effort of industry is to supply the implements, apparatus, and machinery for his own employment; and as society and the arts advance, and the operations of industry are extended, the implements, apparatus, machinery, and materials requisite in conducting the processes of production must be proportionally accumulated; and these will constitute a part of the capital of a community, and also of an individual, which is essential to success in productive processes. And these can be commanded by any one in proportion to the extent of his individual capital; or, if he have credit, then his resources for production will depend upon the capital of others — in other words, that of the community to which he belongs.

In considering the aggregate capital of a community we may put out of the question all the debts due from any of the members to others; for, whether these be great or small — and they will vary according as the practice of giving credit is more or less in use — still the capital of the community will consist in its lands, buildings, ships, machinery, materials on hand, implements; in short, in all those things which bear a value in the market. Provided the community owes no debt abroad, these will constitute its aggregate capital; and, if its members are indebted abroad, we find its actual net capital, as in the case of an individual, by deducting the amount of its debts from the value of its possessions, without regarding the debts due from some of its members to others.

Capital has long been recognized as necessary as an auxiliary to labor, despite the fact that in more recent times it has been urged by unscholarly writers and by demagogues that capital is really the tyrant of labor and that the latter could readily dispense with it. The cultivator of the soil demands a spade or a plow, the blacksmith an anvil, hammer, and bellows, etc. All trades and industries demand certain instruments,— tools, raw material, every kind of supplies, and all these are capital. This, being true on a more primitive basis, is proportionately truer in a civilized state, where labor is complicated and returns are not immediate. «In that rude state of society,» says Adam Smith, "in which there is no division of labor, in which exchanges are seldom made, and in which every man provides everything for himself, it is not necessary that any stock should be stored up in order to carry on the business of the society. . . . But when the division of labor has once been thoroughly introduced, the produce of a man's own labor can supply but a very small part of his occasional wants. The far greater part of them are supplied with the produce of other men's labor, which he purchases with the produce, or, what is the same thing, with the price of the produce of his own. But this purchase cannot be made till such time as the produce of his own labor has not only been completed but sold. A stock of goods of different kinds, therefore, must be stored up somewhere sufficient to maintain him and to supply him with the materials and tools of his work.» At any given time, capital may be arranged under the three heads above indicated — subsistence, tools, and materials.

An owner of capital, possessing an amount larger than he is capable of using in his own work, obtains the labor of others. He either attempts an industry with the assistance of workmen to whom he pays a remuneration agreed upon, or diverts a portion of his capital as a loan, or as stock, or in some other way, such capital being made effective by others. On the contrary one not possessing capital adequate to the useful employment of his activities, undertakes the combination of his labor with the capital of another. This combination may vary according to circumstances, and may of course be at times unfavorable to labor.

Capital is distinguished into floating or movable, and fixed; the former consisting of things that may be transferred by delivery of any kind from place to place, the latter of land, houses, and other property which must be taken delivery of in the place where they stand. Another use of the distinction is made to represent the difference between the permanent plant of a business and the current capital necessary to carry it on. Capital may thus be said to be fixed either when it is physically incapable of being moved, or when it is rendered immovable by the permanent arrangement of its owner. Thus one carrying on a flour-mill wants a floating or disposable capital, over and above the cost of his works, to be invested in wheat to be floured, and flour not yet disposed of. This instance illustrates what is meant by the floating or disposable capital of a whole community, being that movable exchangeable stock of things on hand, over and above the fixtures and apparatus of production, including lands, buildings, ships, working animals, all the implements of the arts, with necessary food, clothing, and a stock of seed sufficient for the time requisite for reproduction. What remains over these is the disposable capital, and, in a flourishing community, the disposable floating capital is constantly invested in new fixed capital, implements and apparatus of production. A declining community, on the contrary, consumes a part of its implements and apparatus of in-

dustry; or what is in effect the same thing, it does not repair and replace the damage of use and decay. The idea is held out in many economical treatises that a community cannot have a surplus capital; that is, it cannot have more capital than it can make use of in its consumption and reproduction. As no grounds whatever are given for this doctrine, it seems to be hardly entitled to a consideration; for the position is certainly, at the first view, very improbable, since we know very well that men may accumulate; and why they may not, in any possible case, accumulate a surplus, does not appear by any plausible reason, and whether such surplus accumulation may be useful or not will depend entirely upon the kind of articles of which such accumulation consists. If it consist in articles the value of which depends on the prices in foreign markets the excess may be of no value at all; for it may so depress the foreign prices as to countervail all the direct advantage arising from the cheaper supply, for a time, of the domestic demand.

Fictitious capital generally means nothing more nor less than excessive credits, which throw the management and disposition of a great deal of property into the hands of persons who are not able to answer for the risks of loss from its bad management, or other causes. A whole community, in the aggregate, can have fictitious capital only in case of its members having an excessive credit in a foreign country. But the members may, among themselves, have a fictitious capital by too great credits in their dealings with each other, and the fiction, in this case, is in their false promises of payment. See POLITICAL ECONOMY; TRUSTS; WAGES.

Capital (*Das Kapital*), a noted work by Karl Marx, published in 1867. English translation edited by Fred Engels, 1887. A book of the first importance, by the founder of international socialism. The conservative aspect of Marx's teaching is in the fact that he honestly seeks to understand what, apart from any man's opinion or theory, the historical development actually is; and that he does not think out and urge his own ideal programme of social reform, but strives to understand and to make understood what must inevitably take place.

Capital Punishment (Latin, *caput*, "the head"; hence *capitalis*, "pertaining to or affecting the head"; hence "affecting the life"), the punishment of death. The questions most commonly discussed by philosophers and jurists under this head are: (1) as to the right of governments to inflict the punishment of death; (2) as to the expediency of such punishment; (3) as to the crimes to which, if any, it may be most properly confined and limited; (4) as to the manner in which it should be inflicted.

1. As to the right of inflicting the punishment of death. This has been doubted by some distinguished persons; and the doubt is often the accompaniment of a highly cultivated mind, inclined to the indulgence of a romantic sensibility, and believing in human perfectibility. The right of society to punish offenses against its safety and good order will scarcely be doubted by any considerate person. In a state of nature individuals have a right to guard themselves from injury, and to repel all aggressions by a force or precaution adequate to the object. This results from the right of self-preservation. If a person attempts to take away my life, I have, doubtless, a right to protect myself against the attempt by all reasonable means. If I cannot secure myself but by taking the life of the assailant, I have a right to take it. It would otherwise follow that I must submit to a wrong, and lose my life rather than preserve it by the means adequate to maintain it. It cannot, then, be denied, that in a state of nature men may repel force by force, and may even justly take away life, if necessary, to preserve their own. When men enter society, the right to protect themselves from injury and to redress wrongs is transferred generally from the individuals to the community. We say that it is generally so, because it must be obvious that in many cases the natural right of self-defense must remain. If a robber attacks one on the highway, or attempts to murder him, it is clear that he has a right to repel the assault, and to take the life of the assailant if necessary for his safety; since society in such a case could not afford him any adequate and prompt redress. The necessity of instant relief, and of instant application of force, justifies the act, and is recognized in all civilized communities. When the right of society is once admitted to punish for offenses, it seems difficult to assign any limits to the exercise of that right, short of what the exigencies of society require. If a state have a right to protect itself and its citizens in the enjoyment of its privileges and its peace, it must have a right to apply means adequate to this object. The object of human punishments is, or may be, threefold: (1) to reform the offender; (2) to deter others from offending; and (3) to secure the safety of the community, by depriving the offender of the power of doing mischief. The first consideration rarely enters into human legislation, because of the inadequacy of our means to produce great moral results by the infliction of punishment. The two latter considerations enter largely into the theory and practice of legislation. Who is to be the judge in such cases? what is the adequate punishment for any offense? Certainly punishments ought not to be inflicted which are utterly disproportionate to the offense, and beyond the exigencies of society. No government has a right to punish cruelly and wantonly and from mere revenge; but still, the discretion must be vested somewhere, to say what shall be the degree of punishment to be assigned to a particular offense. That discretion must be, from its nature, justly a part of the legislative power, and to be exercised according to the actual state of society. It may,—nay, it must,—be differently exercised in different ages and in different countries; for the same punishment which in one age or country may be sufficient to suppress an offense, or render it comparatively harmless, may, in another age or country, wholly fail of the effect. If mild punishments fail of effect, more severe ones must be resorted to if the offense be of a nature which affects society in its vital principles, or safety, or interests. The very frequency of a crime must often furnish a very strong ground for severe punishment, not only as it furnishes proof that the present punishment is insufficient to deter men from committing it, but from the increased necessity of protecting society against dangerous crimes. But it is often said that life is the gift of God,

and therefore it cannot justly be taken away, either by the party himself or another. If he cannot take it away, he cannot confer that power on others. But the fallacy of this argument is obvious. Life is no more the gift of God than other personal endowments or rights. A man has, by the gift of God, a right to personal liberty and locomotion, as well as to life; to eat and drink and breathe at large, as well as to exist, yet no one doubts that, by way of punishment, he may be confined in a solitary cell; that he may be perpetually imprisoned or deprived of free air, or compelled to live on bread and water. In short, no one doubts that he may be restrained in the exercise of any privileges or natural rights short of taking his life. Yet the reasoning, if worth anything, extends to all these cases in an equal degree. If, by his crimes, a man may justly forfeit his personal rights, why not his life? But we have seen that it is not true, even in a state of nature, that a man's life may not be taken away by another if the necessity of the case requires it. Why, then, may not society do the same if its own safety requires it? Is the safety of one person more important than the safety of the whole community? Then, again, as to a man's inability to confer on others a right which he does not himself possess. Suppose it is so; the consequence which is deduced from this does not, in fact, arise. Blackstone, indeed, seems to deduce the right of society to punish capital offenses in certain cases (that is, in cases of *mala prohibita* and not *mala in se*) from the consent of the offenders. The Marquis Beccaria, on the other hand, denies than any such consent can confer the right, and therefore objects to its existence. But the notion of consent is, in nearly all cases, a mere theory, having no foundation in fact. If a foreigner comes into a country and commits a crime at his first entrance, it is a very forced construction to say that he consents to be bound by its laws. If a pirate commits piracy, it is absurd to say that he consents to the right of all nations to punish him for it. The true and rational ground on which the right rests is not the consent of the offender, but the right of every society to protect its own peace, interests, property, and institutions, and the utter want of any right in other persons to disturb, or destroy, or subtract them. The right flows, not from consent, but from the legitimate institution of society. If men have a right to form a society for mutual benefit and security, they have a right to punish other persons who would overthrow it. There are many cases where a state authorizes life to be taken away, the lawfulness of which is not doubted. No reasonable man doubts the right of a nation, in a just war, especially of self-defense, to repel force by force and to take away the lives of its enemies. And the right is not confined to repelling present force, but it extends to precautionary measures which are necessary for the ultimate safety of the nation. In such a war a nation may justly insist upon the sacrifice of the lives of its own citizens, however innocent, for the purpose of ensuring its own safety. Accordingly we find that all nations enrol militia and employ troops for war, and require them to hazard their lives for the preservation of the state. In these cases life is freely sacrificed by the nation; and the laws enacted for such purposes are deemed just exercises of power. If so, why may not life be taken away by way of punishment if the safety of society requires it? If a nation may authorize, in war, the destruction of thousands, why may it not authorize the destruction of a single life, if self-preservation require it? The mistake, however, is in supposing that life cannot be taken away without the consent of the party. If the foregoing reasoning be correct, such consent is neither supposed nor necessary. In truth, the supposition of an original compact between all the persons who are subject to the regulations of a society, by their own free consent, as the necessary and proper basis on which all the rights of such society depend, is at best a gratuitous supposition, and it sometimes leads to very incorrect results. It may be added that the Scriptures most clearly recognize and justify the infliction of capital punishments in certain cases.

2. As to the expediency of capital punishment. This opens a wide field for discussion. Some able men who do not doubt the right do still deny the expediency of inflicting it. It may be admitted that a wise legislature ought to be slow in affixing such a punishment to any but very enormous and dangerous crimes. The frequency of a crime is not of itself a sufficient reason for resorting to such a punishment. It should be a crime of great atrocity and danger to society, and one which cannot otherwise be effectually guarded against. In affixing punishments to any offense, we should consider what are the objects and ends of punishment. It is clear that capital punishment can have no effect in reforming the offender himself. It may have, and ordinarily does have, the effect of deterring others from committing a like offense; but still, human experience shows that even this punishment, when inflicted for small offenses, which are easily perpetrated, and to which there is great temptation, does not always operate as an effectual terror. Men are sometimes hardened by the frequent spectacles of capital punishments and grow indifferent to them. Familiarity deprives them of their horror. The bloodiest codes are not those which have most effectually suppressed offenses. Besides, public opinion has great weight in producing the acquittal or condemnation of offenders. If a punishment be grossly disproportionate to the offense, if it shock human feelings, there arises, insensibly, a sympathy for the victim and a desire to screen him from punishment; so that, as far as certainty of punishment operates to deter from crimes, the object of the legislature is often thus defeated. It may be added that a reasonable doubt may fairly be entertained whether any society can lawfully exercise the power of punishing beyond what the just exigencies of that society require. On the other hand, a total abolition of capital punishments would, in some cases at least, expose society to the risk of deep and vital injuries. A man who has committed murder deliberately has proved himself unfit for society and regardless of all the duties which belong to it. The safety of society is most effectually guarded by cutting him off from the power of doing further mischief. If his life be not taken away, the only other means left are confinement for life or transportation and exile for life. Neither of these is a perfect security against the commission of other crimes, and may not always be

within the power of a nation without great inconvenience and great expense to itself. It is true that the latter punishments leave open the chance of reform to the offender, which is indeed but too often a mere delusion; but, on the other hand, they greatly diminish the influence of another salutary principle, the deterring of others from committing like crimes. It seems to us therefore that it is difficult to maintain the proposition that capital punishments are at all times and under all considerations inexpedient. It may rather be affirmed that in some cases they are absolutely indispensable to the safety and good order of society. Some states have, however, entirely abolished capital punishment, as is the case in Holland, Rumania, Portugal, a certain number of the Swiss cantons, and some States of the American Union. It was entirely abolished in Switzerland in 1874, but a few years after, owing to the increase of murders, it was again made permissible. It was also for a time done away with in Austria and in one or two of the States of this country.

3. As to the crimes to which capital punishments may most properly be limited. From what has been already said it is plain that this must depend upon the particular circumstances of every age and nation; and much must be left to the exercise of a sound discretion on the part of the legislature. As a general rule humanity forbids such punishments to be applied to any but crimes of very great enormity and danger to individuals or the state. If any crimes can be effectually suppressed by moderate means, these ought certainly to be first resorted to. The experience, however, of most nations, if we may judge from the nature and extent of their criminal legislation, seems to disprove the opinion so often indulged by philanthropists that capital punishments are wholly unnecessary. The codes of most civilized nations used to abound with capital punishments. That of Great Britain long continued to be very sanguinary. Blackstone, in his 'Commentaries,' admits that in his time not less than 160 crimes were by the English law punishable with death. Forgery was one of these up to the reign of William IV. The only crimes for which capital punishment may now be inflicted, according to the law of England, are high treason and murder. The law in Scotland is substantially the same, a sentence of capital punishment now being competent only in cases of treason, murder, and attempts to murder in certain cases. By United States statutes nine crimes are so punishable, including treason, murder, arson, rape, piracy, and robbery of the mail. In several States of the Union still fewer crimes are generally punishable with death. Beyond treason, murder, arson, piracy, highway robbery, burglary, rape, and some other offenses of great enormity and of a kindred character, it is extremely questionable whether there can be necessity or expediency in applying so great a severity. Beccaria, with his characteristic humanity and sagacity, has strongly urged that the certainty of punishment is more important to deter from crimes than the severity of it.

4. As to the manner of inflicting the punishment of death. This has been different in different countries, and in different stages of civilization in the same countries. Barbarous nations are generally inclined to severe and vindictive punishments; and, where they punish with death, to aggravate it by prolonging the sufferings of the victim with ingenious devices in cruelty. And even in civilized countries, in cases of a political nature or of very great atrocity, the punishment has been sometimes inflicted with many horrible accompaniments. Tearing the criminal to pieces, piercing his breast with a pointed pole; pinching to death with red-hot pincers; starving to death; breaking his limbs upon the wheel; pressing to death in a slow and lingering manner; burning at the stake; crucifixion; sawing to pieces; quartering alive; exposure to wild beasts; and other savage punishments, have been sometimes resorted to for the purposes of vengeance, public example, or public terror. Compared with these the infliction of death by drowning, strangling, poisoning, bleeding, beheading, shooting, or hanging is a moderate punishment. In modern times public opinion is strongly disposed to discountenance the punishment of death by any but simple means; and the infliction of torture is almost universally reprobated. Even in governments where it is still countenanced by the laws it is rarely resorted to; and the sentence is remitted, by the policy of the government, beyond the simple infliction of death. In Prussia, where atrocious criminals were required by the penal code to be broken upon the wheel, the king latterly used always to issue an order to the executioner to strangle the criminal (which was done by a small cord not easily seen) before his limbs were broken. So in the same country, where robbery attended with destruction of life was punished by burning alive, the fagots were so arranged as to form a kind of cell in which the criminal was suffocated by the fumes of sulphur, or other means, before the flame could reach him. Not only is torture now abolished by civilized nations, but even the infliction of capital punishment in public has been given up by most of them. In England, in high treason, the criminal is sentenced to be drawn to the gallows, to be hanged by the neck until he be dead, to have his head cut off, and his body divided into four parts, and these to be at the disposal of the Crown. But, generally, all the punishment is remitted by the Crown, except the hanging and beheading, and these too may be altogether remitted according to circumstances. In other cases the punishment is now simply by hanging, or, in the military and naval service, by shooting. In France formerly the punishment of death was often inflicted by breaking the criminal on the wheel. The usual punishment now is beheading by the guillotine. In 1853 a kind of guillotine (*Fallschwert*) was introduced into the kingdom of Saxony, and it has since been adopted as the means of execution in several other German states. In Austria the general mode of punishment is by hanging. In Prussia hanging is rarely inflicted; but the usual punishment is beheading with a heavy axe, the criminal's head being first tied to a block. In one or two German states execution by the sword still exists. It should be remarked, however, that in Germany hanging has always been deemed the most infamous sort of punishment; and the sentence has often been commuted for beheading by the sword as a milder or less dishonorable mode of punishment. In the United States of America hanging is the almost universal mode of capital punish-

ment, though electricity has recently been tried. The Constitution of the United States contains a provision against "cruel and unusual punishments." In China decapitation by the sword is the usual form: murderers are cut to pieces; robbers not. In Russia the punishment of death has been frequently inflicted by the knout. In Turkey strangling and sewing the criminal up in a bag, and throwing him into the sea, are common modes of punishment. In the Roman code many severe and cruel punishments were prescribed. During the favored times of the republic many of these were abolished or mitigated. But again, under the emperors, they were revived with full severity. In the ancient Grecian states the modes of punishment were also severe and often cruel. The ancient Greek mode of capital punishment by taking poison at such hour as the condemned party should choose, seems never to have been in use among any Christian people.

Whether execution ought to be public or private has been a question much discussed, and one upon which a great diversity of opinion exists among intelligent statesmen. On the one hand, it is said that public spectacles of this sort have a tendency to brutalize and harden the people, or to make them indifferent to the punishment; and the courage and firmness with which the criminal often meets death have a tendency to awaken feelings of sympathy, and even of admiration, and to take away much of the horror of the offense as well as of the punishment. On the other hand it is said that the great influence of punishment in deterring others from the like offense cannot be obtained in any other way. It is the only means to bring home to the mass of the people a salutary dread and warning; and it is a public admonition of the certainty of punishment following upon crime. It is also added that all punishments ought to be subjected to the public scrutiny, so that it may be known that all the law requires, and no more, has been done. Since 1868 the law of the United Kingdom has required all executions to take place privately within the prison walls, and this system seems to have given general satisfaction. The same method is also practised in various other countries. In 1870 a similar measure was proposed in the French Assembly, but the war prevented it being passed and it is not yet law.

In England, the court before which the trial is held declares the sentence and directs the execution of it. In the courts of the United States there is a like authority; but in the laws of many of the States there is a provision that the execution shall not take place except by a warrant from the governor, or other executive authority. In cases of murder and other atrocious crimes the punishment in England is usually inflicted at a very short interval after the sentence. In America there is usually allowed a very considerable interval, varying from one month to six months. In Great Britain there lies no appeal from the verdict of a jury and the sentence of a court, in capital cases, and the very fact that the verdict and sentence are final produces great caution and deliberation in the administration of criminal justice, and a strong leaning toward the prisoner on trial. In the United States there is considerable latitude of appeal. In France there may be a review of it in the court of cassation. In Germany there is, in criminal as in civil cases, a right of appeal; hence, in that country, few innocent persons have suffered capitally since the 16th century. Capital punishment cannot be inflicted, by the general humanity of the laws of modern nations, upon persons who are insane or who are pregnant, until the latter are delivered and the former become sane. It is said that Frederick the Great required all judgments of his courts condemning persons to death, to be written on blue paper; thus he was constantly reminded of them as they lay on his table among other papers, from which they were readily distinguished. He usually took a long time to consider such cases, and thus set an excellent example to sovereigns of their duty.

Capitals (*majuscula*), the large letters used in writing and printing, most commonly as the initial letters of certain words, or of all words in certain positions, and distinguished from the small letters (*minuscula*). As among the ancient Greeks and Romans, so also in the early part of the Middle Ages, all books were written without any distinction in the kind of letters used; but gradually the practice became common of beginning a book, subsequently, also, the chief divisions and sections of a book, with a large capital letter, usually illuminated and otherwise richly ornamented. In legal or state documents of the 13th century capital letters are found dispersed over the text as the initial letters of proper names, and of the names of the Deity, and in the next century the same usage was followed in ordinary manuscripts. The practice with regard to the use of capitals varies in different countries. Sentences and proper names begin almost universally with capitals, but there are several other cases in which the usage is not so general. In English there cannot be said to be any invariable rule regulating their use. The first personal pronoun is always written and printed with a capital letter, and it is common also to begin titles and the names of well-known public bodies, societies, institutions, etc., with capitals. Formerly, it was a frequent practice to begin all substantives in English with a capital, which is still the rule in German. The Germans also begin all titles and pronouns of address with capitals, but not the first personal pronoun. One point in which the English practice differs from that of Germany, France, Italy, and other continental countries, is in beginning adjectives derived from proper names, such as Spanish, Italian, etc., like proper names themselves, with capitals, such adjectives being printed in other countries entirely with small letters.

Capitanis, kăp-ĭ-tā'nēs. See ARMATOLES.

Capitation is applied to anything that concerns a number of persons individually. Thus a capitation-tax is a tax imposed upon all the members of a state, each of whom has to pay his share, and is distinguished from taxes upon merchandise, etc. A capitation-grant is a grant given to a number of persons, a certain amount being allowed for every individual among the number.

Capito, or Kopfel, Wolfgang Fabricius, vōlf'gāng fā-brēt'sē-oos cä'pē tō, or kėp'fėl, Alsatian reformer: b. Haguenau, 1478; d. Strassburg, November 1541. Entering the Benedictine order, he became professor of theology at Basel, where he showed in his lectures

a tendency to shake off the trammels of the scholastic writers. He approved of Luther's action, but nevertheless in 1519 entered the service of Albert of Mainz; and it was not till some years later that he finally declared for the Reformation. He then entered zealously into its work, shared with Bucer the composition of the Confessio Tetrapolitana, and took part in the Synod of Bern in 1532.

Cap'itol, now *Campidoglio,* the citadel of ancient Rome, standing on the Capitoline Hill, the smallest of the seven hills of Rome, anciently called the Saturnine and the Tarpeian Rock. It was planned and said to have been begun by Tarquinius Priscus, but not completed till after the expulsion of the kings. At the time of the civil commotions under Sulla it was burned down, and rebult by the senate. It again suffered the same fate twice, and was restored by Vespasian and Domitian. The latter caused it to be built with great splendor, and instituted there the Capitoline games. Dionysius says the temple, with the exterior pillars, was 200 feet long and 185 broad. The whole building consisted of three temples, which were dedicated to Jupiter, Juno, and Minerva, and separated from one another by walls. In the wide portico triumphal banquets were given to the people. The statue of Jupiter, in the capitol, represented him sitting on a throne of ivory and gold, and consisted in the earliest times of clay painted red. Under Trajan, it was formed of gold. The roof of the temple was made of bronze; it was gilded by Quintus Catulus. The doors were of the same metal. Splendor and expense were lavished upon the whole edifice. On the pediment stood a chariot, drawn by four horses, at first of clay, and afterward of gilded brass. The temple itself contained an immense quantity of the most magnificent presents. The most important papers were preserved in it. The Capitoline Hill consists of three parts, namely, the northern summit, now occupied by the church of Santa Maria in Aracœli; the southern summit, crowned by the Palazzo Caffarelli, now occupied by the German ambassador; and the depression between these, in which is now the Piazza del Campidoglio. The above church, which is approached from the northwest by a lofty flight of steps, is of great antiquity. In 1888 the Franciscan monastery which was connected with it was replaced by a large monument of Victor Emmanuel II. The Piazza del Campidoglio was designed by Michael Angelo. In its centre is a fine equestrian bronze statue of Marcus Aurelius. On the southeast side there is the Palazzo del Senatore, with a fine flight of steps erected by Michael Angelo. The Palace of the Conservatori occupies the southwest side of the square, and contains valuable collections in art and antiquities. Directly opposite is the Capitoline Museum, founded by Innocent X. The southern summit of the hill is now called Monte Caprino, and on it, beside the Palazzo Caffarelli already mentioned, stands a hospital and a German archæological institute. (See ROME.) Besides the edifice in Washington where Congress assembles, some of the statehouses in States of the Union are officially called capitols.

Capitol at Washington, History of the. After the national capital had been located on the Potomac in 1789, Washington and Major P. C. L'Enfant selected sites for the public buildings. On the first map (1791), the "Congress House" is situated as now, on a low hill commanding the best view in Washington, with 12 broad streets radiating from it, so that it closes the vista of every main avenue. On the decision of a board of three commissioners, with Washington and Jefferson, the plans of the capitol and the President's house were given out in 1792 to public competition, for a prize of $500 or a medal of that value, at the winner's option. For the President's house James Hoban's plans were accepted at once, and he was made superintendent of its erection. For the capitol none were satisfactory, but the three foremost competitors were given another trial, and one, Stephen Hallet, a French artist living in Philadelphia, was employed at a salary and indemnity to revise his plans under the commissioners' criticism. But later in the year Dr. William Thornton (q.v.) of Tortola Island, W. I., submitted plans whose "grandeur, simplicity, beauty, and convenience" forced the committee to accept them. They were too grand for the commissioners' ideas of national needs or resources at the time, however, and specified too costly materials. Thornton wished marble and mahogany and the best of construction, and under a bitter assault from several of his rejected competitors, headed by Hallet, whom the commissioners had joined with Thornton in a revising board, he was forced to reduce its scale and material greatly. Their suggested modifications of his general plan were, however, disapproved. These plans were for what is now the central portion of the capitol.

Work was begun about 1 August. The corner-stone was laid 18 September in the southeast corner of the old north wing, now the supreme court section, with imposing ceremonies, Masonic rites and procession, and a barbecue. Hoban was made superintendent, and Hallet his assistant; but Hoban gave his whole time to the White House, as the President's house came to be called, and Hallet was the real manager. He proceeded to change Thornton's plans and specifications at will, was repeatedly censured for it, and at last ordered to stop it. He resigned, but refused to give up the drawings; the commissioners at last secured them and discharged him, 15 Nov. 1794. Thornton, now one of the commissioners of the District of Columbia, was asked by Washington to obliterate Hallet's changes as injurious, and did so. Hoban now acted as superintendent until George Hadfield, an English architect, was engaged to succeed Hallet, on Jonathan Trumbull's recommendation of him as a modest man and good artist. He outdid Hallet; spent his whole energy in fighting Thornton and Hoban (who always worked in harmony), and after repeated resignations and reconsiderations, was discharged for practical incompetence 10 May 1798. Hoban again took charge. On 17 Nov. 1800 the second session of the sixth Congress met in the north wing of the building. Much of this early construction was of wood or poor material. This was on account of haste, the local interests being very urgent for the coming of the government to that seat. A few years later more durable material was substituted. The commissionership was abolished May 1802, and Thornton and Hoban ceased direct superintendence, though often called in

THE NATIONAL CAPITOL, WASHINGTON, D. C.

Main

consultation. At this time the north wing was complete, the foundation of the central rotunda and dome in place, and the basement story of the south wing partly done. These are still as Thornton planned them.

On 6 March 1803 Jefferson appointed Benjamin H. Latrobe (q.v.) "surveyor of public buildings." He at once began, like the others, to besiege the President with the bitterest assaults on Thornton's designs, and when the former declined to interfere, appealed to Congress. Thornton, however, now in charge of the patent office, though he defended himself with severity, made no further attempt to prevent the alteration of his plans; and Latrobe made many serious changes, some of them since judged harmful to beauty and utility. Thus, the Representatives' hall was changed from a graceful, ellipse to a square with semicircular ends; a bad echo gave trouble for many years, caused by the changes. The number and size of entrances to the rotunda were curtailed, the splendid open staircases, cut down and placed in obscurity, were difficult for strangers to find; and the grand semicircular western portico was abolished. The principal entrance was also changed from the west front, facing the White House, to the eastern side. Latrobe was constantly in hot water with both Jefferson and Congress, and published a pamphlet against them in 1806; but till 1811 had pretty much his own way. When the War of 1812 broke out, the capitol consisted of the north and south wings, connected by a corridor of rough boards over the central foundations. On 24 Aug. 1814 the British burnt it as far as possible, piling the furniture and platforms in the rooms with rocket stuff and igniting them; the interior was dreadfully damaged, but the outside walls remained, also the inside brickwork and some stone. A strong movement arose for removing the capital elsewhere; but the same considerations prevailed against it as later. In fear of such a result, however, the local interests formed the "Capitol Hotel Company," and erected a building for government occupancy till the repairs on the capitol were finished. It was occupied, 1815–19, and was afterward known as the "Old Capitol," and used in the Civil War as a military prison. In the reconstruction the House wing was entirely altered.

Near the end of 1817 Latrobe became embroiled with a new commissioner of the Federal building, Samuel Lane, and resigned. In his place was appointed Charles Bulfinch (q.v.), from 1 Jan. 1818; he remained supervising architect for the next decade. In the winter of 1819–20 Congress took its seat in the new hall. The centre was pushed forward to completion, and on 10 Dec. 1824, the entire interior was finished. In 1825 a public competition was held for the figures on the pediment of the eastern portico. From 1826 on Bulfinch was employed on special detail, and the landscape gardening and work on the grounds, which were of his designing. The capitol was set in a park of 22½ acres, encircled by an iron railing somewhat taller than a man, affixed in the sandstone coping of a low wall. There were four carriage and five pedestrian entrances. On 2 March 1828 the position of architect of the capitol was abolished; but Bulfinch remained in employment till the end of June 1829, when Jackson dismissed him. He designed and planned the modern form of the then west extremity of the building, the Senate galleries, and the terraces on the east; and made the dome higher than in Thornton's plan. Among others who should have great credit for the beauty of the capitol are Peter Lenox, clerk of works under Latrobe; George Blagden, superintendent of stonecutters; and Giovanni Andrei, an Italian, superintendent of carvers. That so beautiful and harmonious a structure should have emerged from the contentions of so many different minds is due partly to the really great ability of the three chief architects, Thornton, Latrobe, and Bulfinch, and partly to the determination of successive Presidents that the changes should harmonize with the original design. Latrobe's material external alterations of Thornton's plan have been mentioned; Bulfinch designed the western central portico as it now stands.

From 1829 to 1836 there was no architect of the capitol. On 6 June 1836, Jackson appointed as Federal architect Robert Mills (q.v.), who had studied under Latrobe; and he held the place till 1851. Thomas U. Walter (q.v.) then took the post, having drawn the plans for the two modern wings that extended the original capitol, which the government needs had outgrown, into the modern one. The corner-stone of the extension was laid by President Fillmore, 4 July 1851; the new Representatives' hall was occupied in 1857; the Senate hall in 1859. The great lengthening of the dimensions required a correspondent heightening of the dome; and Mr. Walter designed a new one, which was constructed during the Civil War, and completed at the close of 1863, the statue of Freedom being then lifted into place. Mr. Walter, however, had foreseen a future need of still further extension, and had drawn plans for it while the other work was going on. These have been awaiting their time since; and Congress in the spring of 1903 authorized their execution, at a probable expenditure of $2,500,000 and three years' time, under the supervision of the present Federal architect, Mr. Woods. This extension is to the eastward, and involves the removal of Latrobe's portico at the east front, but none of the old walls. The present front wall will become the rear wall of an open court, which is to light the west side of the addition. This will contain 66 new and handsome rooms, divided equally between the Senate and the House. (For a minute history of the capitol down to 1851, see Glenn Brown in the 'American Architect,' Vols. LXII.–LXV.).

Capitoline Games, games held in ancient Rome in celebration of the deliverance of the city from the Gauls, and in honor of Jupiter Capitolinus, to whom they ascribe the salvation of the capitol in the hour of danger. They were instituted 387 B.C., after the departure of the Gauls.

Capitoli'nus, Julius, Roman historian, who lived toward the end of the 3d century, and wrote the lives of nine emperors. He is one of the writers of the 'Historia Augusta,' in the editions of which his works are to be found.

Capitulary, ka-pĭt'ū-la-rĭ (Lat. *capitula,* "chapters"), a writing divided into heads or chapters, especially a law or regal enactment so divided into heads. Laws known by this designation were promulgated by Childebert, Clothaire, Carloman, and Pepin, kings of France;

but no sovereign seems to have put forth so many of them as the Emperor Charlemagne, who appears to have wished to effect, in a certain degree, a uniformity of law throughout his extensive dominions. With this view it is supposed he added to the existing codes of feudal laws many other laws, divided or arranged under small chapters or heads, sometimes to explain, sometimes to amend, and sometimes to reconcile or remove the differences between them. These were generally promulgated in public assemblies composed of the sovereign and the chief men of the nation, both ecclesiastical and secular. They regulated equally the spiritual and temporal administration of the kingdom; and the execution of them was entrusted to the bishops, the courts, and the *missi regii*, officers so called because they were sent by the French kings of the first and second race to dispense law and justice in the provinces. Many copies of these capitularies were made, one of which was generally preserved in the royal archives. The authority of the capitularies was very extensive. It prevailed in every kingdom under the dominion of the Franks, and was submitted to in many parts of Italy and Germany. The earliest collection of the capitularies is that of Anségise, abbot of Fontenelles. It was adopted by Louis the Debonnaire and Charles the Bald, and was publicly approved of in many councils of France and Germany. But as Anségise had omitted many capitularies in his collection, Benedict, the Levite or deacon of the church of Mentz, added three books to them. Each of the collections was considered to be authentic, and of course was appealed to as law. Subsequent additions have been made to them. The best editions of them are those of Baluze (two volumes, Paris 1677), and of Pertz in the 'Monumenta Germaniæ Historica' (2d div. Vols. I. and II.; Hanover 1835–7). The capitularies remained in force in Italy longer than in Germany, and in France longer than in Italy. The incursions of the Normans, the intestine confusion and weakness of the government under the successors of Charlemagne, and above all the publication of the epitome of canon law termed the Decretum of Gratian, about the year 1150, which totally superseded them in all religious concerns, put an end to their authority in France.

Capitula'tion ("a writing drawn up in heads"), in military language, the act of surrendering to an enemy upon stipulated terms, in opposition to a surrender at discretion.

In the 15th century capitulations, as they were called, were presented by the ecclesiastical establishments in Germany to their newly chosen abbots and bishops, who were obliged to swear to observe them as laws and conditions for their future rule. The ecclesiastical Electors obtained, after the fall of the Hohenstaufen family, certain advantageous promises from the new emperors, which were called capitulations. When Charles V. was proposed as emperor, and it was apprehended, on account of his foreign education, that he would disregard the German constitution, he was obliged to make oath that he would not reside without the German empire, nor appoint foreigners to office in the empire, etc. This was called his "election capitulation." Such a *Wahlcapitulation* was afterward presented to every new emperor as a fundamental law of the empire. In this way the authority of the German emperors was constantly more and more diminished, so that at last it became merely nominal, since the electors, at the choice of every new emperor, made some new infringement on the imperial privileges. The *Wahlcapitulationen* were acknowledged bargains, certainly unique in history.

Capiz, kä pēth', Philippines, capital of the province of Capiz, situated in the northern part of the island of Panay, four miles from the mouth of the Panay or Capiz River. The river is navigable to the city, and there is also an excellent roadstead at its mouth. There is a large local trade, particularly in rice, and connection by steamer with Manila. Capiz is also a telegraph and military station. Pop. 13,676.

Cap'lin, or **Capelin,** a small savory smelt (*Mallotus villosus*), found in large numbers on the Arctic coast as far south as Cape Cod. The inhabitants of Newfoundland and Labrador catch it in large quantities at certain seasons, and many are dried and exported to Great Britain.

Capmany y Montpalau, Antonio de, ān-tō'-nē-ō dā käp mä nē ē mōnt-pạ-läṅ', Spanish critic and historian: b. Barcelona, 24 Nov. 1742; d. Cadiz, 14 Nov. 1813. He served in the wars with Portugal in 1762, left the army in 1770, and joined Olavide in his scheme for colonizing and cultivating the Sierra Morena. This enterprise terminated disastrously, and Capmany removed to Madrid, where he was chosen secretary of the Royal Historical Academy of Spain in 1790, and filled several offices in the gift of the government. He traveled in Italy, Germany, France, and England. When the French entered Madrid in 1808, he fled to Seville, arriving there destitute and in rags. He was chosen a member of the Cortes of Cadiz, in which capacity he made himself conspicuous by his patriotism and active opposition to the new rulers. His works, which enjoy a high reputation in Spain, are numerous; among them are 'Memorias historicas sobre la Marina, Commercio y Artes de la antiqua Ciudad de Barcelona'; 'Questiones criticas sobre varios puntos de historia, economica, politica y militar'; 'Teatro historico-critico de la Elocuencia Española'; and 'Dictionario Frances-Español.'

Cap'nomancy, divination by smoke, one of the modes of divination resorted to by the ancients. They used to burn vervain or some other sacred plant, and observe the form and direction which the smoke took in escaping, and from these circumstances they drew their auguries. Sometimes the smoke of sacrifices was observed instead of that of vervain. When this smoke was thin and transparent, it was considered a good omen; if, on the contrary, it was thick and opaque, the omen was bad. Another method of acquiring a knowledge of the future by capnomancy was to throw the seeds of jasmine or poppy on burning coals, and to observe the smoke which rose from them.

Capo d'Istria, Austria (the ancient ÆGIDA, later JUSTINOPOLIS), a seaport on the Gulf of Trieste, nine miles south of Trieste. It is connected with the mainland by a causeway rather more than half a mile long. It is defended by an old fort now going to decay. It contains a cathedral, a lofty edifice, faced in the Venetian

style with marble, and containing some fine paintings, sculptures, and arabesques. It is the seat of a bishop, and has six monasteries and two nunneries, a gymnasium, several hospitals, and a penitentiary. There are manufactories of soap, candles, leather, and sea-salt; and there is also a considerable trade in wines, oil, and fish. After the 10th century Capo d'Istria belonged, alternately, to the Venetians and Genoese, till finally, in 1478, it succeeded in making itself independent of the latter with the aid of the former. Capo d'Istria now became the capital of Istria, and along with it came into the possession of Austria in 1815. Pop. (1903) about 12,000.

Capo d'Istrias, or **Capo d'Istria, Ioannes Antonios,** yō-än'nēs än-tō'nyōs kä-pō-dēs'-trē-as, COUNT, Greek statesman: b. Corfu, 11 Feb. 1776; d. Nauplia, 9 Oct. 1831. His family had been settled in Corfu since 1373, but originally came from the Illyrian town of Capo d'Istria. He devoted himself to political life, and in 1809, after holding a high place in the Ionian Islands, entered the diplomatic service of Russia. Here his policy tended to the separation of Greece from Turkey. In 1828 he entered on a seven years' presidency of Greece; but whether from his attachment to Russian interests, or from the jealousy and impatience of restraint of the chiefs, he speedily became extremely unpopular. Several of these unruly chiefs belonging to the islands and to the province of Maina at last, in the spring of 1831, rose in open rebellion against him, demanding a convocation of the national assembly, the establishment of the liberty of the press, and the release of certain state prisoners, especially of Petros Mauromichalis, one of their own number whom D'Istrias had arrested and imprisoned. The president obtained the aid of Russia, but before the insurrection could be quelled he was assassinated in a church at Nauplia, by Constantine and George Mauromichalis, the brother and nephew of Petros Mauromichalis.

Caponière, kä-pō-nyār, or **Caponnière,** in fortification, a place covered against the fire of the enemy on the sides, sometimes also above, and serving for the connection of two works or for maintaining an important point. In particular:

1. A passage secured by two parapets, in the form of glacis, which leads through the dry ditch from one work to another; for instance, from the chief wall to the ravelin. If danger is to be apprehended only from one side, and consequently only one parapet is made, it is called a demi-caponnière; if it is covered above with hurdles or with wood, it is called a coffer: but this word is often used indifferently for caponnière.

2. Small block-houses in the covered way, for its defense. Coehorn laid out similar but less useful works below the glacis, and Scharnhorst proposes them, under the name of field-caponnières, for the salient angles of field fortification.

Capote, Domingo Mendez, dō-mēng'gō mēn-dāth' kä-pō'tā, Cuban statesman: b. Cardenas, 1863. He was graduated at the University of Havana, and became one of the best-known lawyers in Cuba. Susequently he was a professor in the University of Havana for many years. In December 1895 he joined the insurgents under Gen. Maximo Gomez; became a brigadier-general; and was appointed civil governor of Matanzas and of Las Villas. In November 1897 he was elected vice-president of the Cuban republic. When the Cuban Constitutional Convention appointed a commission of five members to confer with President McKinley and Secretary Root concerning the future relations of the United States and Cuba, he became its leader. The conference was held in Washington, D. C., in April 1901.

Capoul, Joseph Amédée Victor, zhō-zĕf a-mā-dā vĕk-tōr kä-pool, French tenor singer: b. Toulouse, 27 Feb. 1839. He was educated at Paris; and sang there in the Opéra Comique, 1861–72, where he was very popular, especially in his role as Gaston de Meillagré in Auber's 'Premier Jour de Bonheur.' He has also sung in New York, London, Vienna, St. Petersburg, and other cities, being everywhere very successful.

Cappadocia, kăp-pā-dō'shĭ-a, in antiquity, one of the most important provinces in Asia, once a famous kingdom; in its widest extent bounded west by Lycaonia, south by Cilicia and Syria, east by Armenia, and north by the Pontus Euxinus. In the period of the Persian government Cappadocia comprehended all the country between the Halys and Euphrates. By the former river it was separated from Phrygia and Paphlagonia; by the latter, from Armenia: therefore the region afterward called Pontus was comprehended in this territory. The Persians divided it, according to Strabo, into two satrapies, which bore the name of Cappadocia Magna, afterward Cappadocia Proper; and Cappadocia Minor, afterward Pontus. This division, however, was not always strictly observed. The Persian satraps governed, at a later time, under the title of kings, and sometimes made themselves independent. At the time of the famous retreat of the 10,000 Greeks, both the Cappadocias seem to have been under the rule of Mithridates, who had participated in the conspiracy of Cyrus the Younger, but retained his government and became, after the defeat of Cyrus, again dependent upon the kings of Persia. Cappadocia Magna was a good grazing country, and also well adapted for the cultivation of grain, especially wheat; but wood was scarce. Mazaca, afterward Cæsareia, now Kaisariyeh, was the residence of the kings of Cappadocia. The name of Leukosyri (White Syrians) is said by Strabo to have been applied to the Cappadocians, as if to distinguish them from the dark Syrians who dwelt to the east of Mount Amanus.

Cappel, kä'pĕl, Switzerland, a village in the canton of Zürich, and 10 miles from the town of Zürich. It contains an old Cistercian convent, founded in 1185, and a simple monument erected in 1838 to the reformer Zwingle, who was killed, 11 Oct. 1531, in a contest which took place near Cappel.

Cap'pon, James, Canadian educator: b. Scotland, 8 March 1854. He was educated at Glasgow University, and since 1888 has been professor of English language and literature at Queen's University, Kingston, Ontario. He has published 'Victor Hugo: a Study and a Memoir'; 'Britain's Title in South Africa.'

Capponi, Gino, MARCHESE, gē'nō mār-kā'zĕ kăp pō'nē, Italian scholar and historian: b. Florence, 14 Sept. 1792; d. there, 3 Feb. 1876. He traveled widely and devoted himself almost entirely to his studies in spite of the fact that he became blind early in life. For a short time in 1848 he was at the head of the Tuscan government; in 1859 he was a member of the Constitutional Convention of Tuscany; he was also made a senator of Italy; and in 1862 was at the head of the Historical Commission for Tuscany, Umbria, and the Marches. He wrote 'Storia della Repubblica di Firenze' (1875); and had a part in the preparation of a lexicon by the Accadamia della Crusca, and in the editing of texts of Dante's 'Divine Comedy.'

Capps, Edward, American philologist: b. 21 Dec. 1866. He was graduated from Illinois College, 1887; took his doctor's degree at Yale, 1891; and was tutor in Latin at the latter place, 1890–2. Since then he has been successively associate professor and professor of Greek in the University of Chicago. Besides a number of philological papers, he has written 'From Homer to Theocritus' (1891).

Caprara, Giambattista, jäm-bät-tēs'tä kä-prä'rä, CARDINAL, Italian ecclesiastic: b. Bologna, Italy, 29 May 1733; d. Paris, 21 June 1810. He studied theology, became vice-legate of Ravenna in 1758 under Benedict XIV., and in 1785 was sent by Pius VI., as nuncio to Vienna, to remonstrate with the Emperor Joseph on his conduct in relation to Church matters. His remonstrance proved ineffectual, but in 1792 he was appointed a cardinal, shortly afterward a member of the state council, and in 1800 bishop of Jest. In 1801 he went to Paris as legate of Pius VII., and conducted the negotiations with the French republic with so much success that in 1802 the first concordate was concluded. Shortly after he was appointed archbishop of Milan, and in 1805 he crowned Napoleon king of Italy.

Caprera, kä-prā'rạ, a small island in the northeast of Sardinia, and separated from it by a narrow strait. It is six miles long from north to south, and two miles broad. It is fertile, and produces both corn and good pasture. It is well known as the ordinary residence of Garibaldi, who since 1854 possessed a dwelling-house on the island, along with a piece of ground which he farmed until his death here in 1882.

Capri, kä'prē, an island in the beautiful Gulf of Naples, which contributes not a little to the charms of this favorite scene of nature. Capri, five miles long and two broad, lies at the entrance of the gulf, and consists of two mountains of limestone, remarkable for their picturesque shape, and a well-cultivated valley. The inhabitants, amounting to 4,600, are occupied in the production of oil and wine, in fishing, and in catching quails, which come in immense numbers from Africa to the shores of Italy. Every spot on the island which can be made productive is cultivated. In fact, agriculture all around Naples is in the highest state of perfection. The town of Capri is the seat of a bishop, to whom all the quails belong. A high rock separates Capri from the little town of Anacapri, which is reached by 522 steps cut in the rock. With the Romans Capri was called Capreæ. Augustus obtained it from the Neapolitans in exchange for Ischia, and made it a place of agreeable retreat, but never made use of it. Tiberius spent here the last seven years of his life in degrading voluptuousness and infamous cruelty. The ruins of his palaces are still extant, and other ruins are scattered over the island. The island of Capri is remarkable for several remarkable caverns or grottoes in its steep, rocky coast. By far the most remarkable of these is unquestionably the celebrated Grotta azzurra (Blue Grotto), which was discovered by a singular accident in the summer of 1832, an Englishman while bathing having observed the opening in the rocks which forms the entrance to the grotto, and swum into it. It gets its name from the fact that, while the sun is shining outside, all the objects within the cavern — rocks, water, and sand — are tinged with a beautiful blue color, very soft and agreeable to the eye. The cavern is elliptical in form, measuring about 1,200 or 1,300 feet in circumference; its height is considerable, and its roof and sides bristle with stalactites. The blue color within the grotto is supposed to be caused by the refraction of the rays of light in passing through the water before entering the cave. The blue rays, with those next to them, the violet and the indigo, being the most refrangible, are the only rays that are admitted, the others — red, orange, etc., being dispersed in the water. In another part of the coast there is another grotto which exhibits phenomena precisely similar, except that the objects in this one are clothed with a green instead of a blue color. It is hence called the Grotta verde (Green Grotto).

Cap'ric Acid. See DECOIC ACID.

Capriccio, kä-prē'chō (*Caprice*), is the name applied to a musical composition, in which the composer follows the bent of his humor. The *capriccio* may be used with propriety in pieces for exercise, in which the strangest and most difficult figures may be introduced, if they are not at variance with the nature of the instrument or of the voice.

Capricor'nus (Lat. *caper*, "a goat," and *cornu*, "a horn"), "the goat," one of the 12 signs of the Zodiac, between Sagittarius and Aquarius; also the corresponding zodiacal constellation, one of Ptolemy's original 48. One of its brightest stars, Alpha, is a wide double, easily separated by the naked eye by any one with good eyesight. Capricornus is surrounded by Aquila, Aquarius, Piscis Austrinus, Microscopium, and Sagittarius.

Caprification, kăp-rĭ-fĭ-kā'shŏn, the fertilization of the flowers of the Smyrna fig with pollen derived from the wild fig, or caprifig. From time immemorial it has been the custom of Orientals to break off the fruits of the caprifig, bring them to the edible-fig trees, and tie them to the limbs. From the caprifigs thus brought in there issues a minute insect, which, covered with pollen, crawls into the flower receptacles of the edible fig, fertilizes them, and thus produces a crop of seeds and brings about the subsequent ripening of the fruit. It has been shown that the varieties of the wild fig or caprifig are the only ones which contain male organs, while the varieties of the Smyrna fig are exclusively female. In the caprifig there are said to exist in Mediterranean regions three crops of fruit,— the spring crop, a summer crop, and a

third, which remains upon the trees through the winter. The fig-insect (*Blastophaga grossorum*) over-winters in the third crop, oviposits in the spring crop, develops a generation within it, each individual living in the swelling of a gall-flower (a modified and infertile female flower), and, issuing from it covered with pollen, enters the young flower receptacles of the young Smyrna fig, which are at that time of the proper size, and makes an attempt to oviposit in the true female flowers, fertilizing them at the same time by means of the pollen adhering to their bodies. The life history of the insect from that time on is not well understood, but the *Blastophaga* has been known to occur again in the over-wintering crop of figs. The effect of caprification on the young Smyrna figs becomes readily visible within a few days; before the *Blastophaga* enters the fig the latter is transverse and strongly ribbed, while a few days after fertilization the fig swells up and becomes rounded and sleek. The male *Blastophaga* is always wingless. It has no ocelli, and its compound eyes are greatly reduced in size. The fact that the male rarely leaves the fig in which it has hatched might almost be inferred from these facts of winglessness and partial blindness. When this wingless male issues from the seed-like gall in which it is contained, it seeks a female gall in the interior of the same fig, gnaws a small hole through its cortex, inserts its extremely long, almost telescopic, abdominal extremity through the hole, and fertilizes the female. The female subsequently, with her powerful jaws, gnaws the top of the gall off and emerges, crawling around the interior of the fig, and eventually forcing her way through the ostiolum, almost immediately seeking for young figs, which she enters, and, should the fig entered prove to be a caprifig, lays her eggs at the base of as many flowers as she can find, and then dies. Should the fig entered, however, be a Smyrna fig, either through the fact of the caprifig from which she issued having been hung in the branches of a Smyrna-fig tree, or from the fact that she has flown to an adjoining Smyrna-fig tree, she walks around among the female flowers seeking for a proper place to oviposit. It is this futile, wandering search, when her body is covered with pollen from the caprifigs, that produces the extensive and almost perfect fertilization of the entire number of female flowers. The young larva is a delicate little maggot curved upon itself and showing no visible segmentation. In the full-grown larva the segments are more apparent, and with the growth of the larva the gall at the base of the male florets becomes hard, and greatly resembles a seed, turning light brown in color. The male and the female pupa each occupies a greater portion of the interior of the gall. Consult: 'The Fig' (United States Department of Agriculture, Washington 1901).

Although figs are raised in California and the southern States they have long been inferior to the Smyrna fig, the standard kind of commerce, which owes its peculiar flavor to the number of ripe seeds which it contains. These seeds are obtained only by the process described above, and the United States Department of Agriculture has recently devoted much attention to caprification, with a view to the development of the American fig industry.

Caprimulgidæ, kăp-rĭ-mŭl'jĭ-dē, the goatsuckers (so called from a superstition regarding their habits), a family of birds of puzzling affinities, but nearest to the swifts (*Cypselidæ*), with which, and the humming-birds, they are often considered to constitute an order, *Macrochires*. The family is characterized by a small bill, enormous gape fringed with elongated, stiff bristles, elongated tail of 10 soft rectrices, long pointed wings, very small feet with the middle claw pectinate, and very lax plumage. Two subfamilies, the *Caprimulginæ* or true goatsuckers, and the *Nyctibiinæ* of tropical America, are recognized, to which the oil-birds (*Steatornis*), and *Podargus* and its allies, are sometimes added as two more. The family is nearly cosmopolitan, and comprises 12 or 15 genera and perhaps 100 species, all birds of more or less crepuscular habits, which catch insects on the wing like swallows. The «night-hawk» and «whip-poor-will» are the common species of the eastern United States.

Caprivi, Georg Leo, gā ōrg lā ō kā-prē'vē, Graf von, sometimes called Caprivi de Caprara de Montecuculi, German soldier and statesman: b. Charlottenburg, 24 Feb. 1831; d. Skyren, 6 Feb. 1899. He entered the army in 1849; fought in the campaigns of 1864 and 1866; and in the Franco-German war of 1870 was chief of staff to the 10th Army Corps. In 1883–8 he was at the head of the Admiralty; in 1888 he became commander of his old army corps. Hence he was removed, on the fall of Bismarck, in 1890, to become imperial chancellor and Prussian prime minister. His principal measures were the army bills of 1892 and 1893, and the commercial treaty with Russia in 1894, in which year he retired.

Capro'ic Acid. See Hexoic Acid.

Capron, Allyn, American soldier: b. Tampa, Fla., 27 Aug. 1846; d. Fort Myer, Va., 18 Sept. 1898. He was graduated at West Point, 1867, and entered the 1st Artillery, receiving his captaincy 4 Dec. 1888. During the Sioux campaign of 1890 he made a brilliant record at the battles of Wounded Knee and Drexel Mission. During the war with Spain, 1898, he opened the fight at El Caney, Cuba, and shattered the first flagstaff in Santiago. During this campaign he was taken ill with typhoid fever, and succumbed to its attack. He was a fine mathematician, and a recognized authority on artillery and tactics. His father, Erastus Allyn Capron was killed at Churubusco, in the Mexican war, 20 Aug. 1847.

Ca'pron, Allen Kissam, American military officer (son of Allyn Capron, q.v.): b. Brooklyn, N. Y., 24 June 1871; d. Las Guasimas, Cuba, 24 June 1898. He enlisted as a private (1890), and rose to a second lieutenancy (1893), joining the «Rough Riders» on the outbreak of the war with Spain. He was made a captain for bravery, and was the first American army officer who fell in that war.

Capryl'ic Acid. See Octoic Acid.

Cap'sicin, kăp'sĭ-sĭn, a name given to two apparently different substances. One described by Braconnot, obtained from chilli pepper, is an acrid oil or oleoresin, of a reddish-brown color, the vapor of which excites sneezing and coughing. It is probably a mixture of different bodies. The other is a resinoid substance ob-

tained from cayenne pepper; it is brown with a golden tint, has the consistence of tar, an aromatic smell and pungent taste, and is used in America as a powerful stimulant in influenza, fever, indigestion, and other disorders, and externally as a rubefacient. Quite recently a volatile alkaloid has been obtained from chilli pepper, by first removing the acrid resin, then making the fluid alkaline, and extracting with petroleum spirit. On evaporating, a substance is produced with an odor like that of conia. It is distinguished from conia and nicotine by a variety of reactions.

Capsicum, a genus of plants of the order *Solanaceæ,* consisting of annual or biennial plants, bearing membranous pods containing several seeds, noted for their hot, pungent qualities. *C. annuum,* a native of South America, furnishes the fruits known as chillies. These, as well as the fruits of *C. frutescens* and other species, are used to form cayenne pepper. For this purpose the ripe fruits are dried in the sun or in an oven, and then ground to powder, which is mixed with a large quantity of wheat flour. The mixed powder is then turned into cakes with leaven; these are baked till they become as hard as biscuit, and are then ground and sifted. Cayenne pepper is largely adulterated with red lead and other substances. *C. fructus* is the dried ripe fruit of *C. fastigiatum,* imported from Zanzibar. It is a small, oblong, scarlet, membranous pod, divided internally into two or three cells containing numerous flat, white, reniform seeds. It has no odor; its taste is hot and acrid. Capsicum fruits are used medicinally, in powder or as a tincture, externally, or as a gargle in cases of malignant sore throat, and internally as a stimulant in cases of impaired digestion.

By reason of the resin-like body, capsicin, which is contained in the fruits of these plants, they possess very active irritant properties. The pure crystals of capsicin are extremely virulent, and readily cause severe poisoning; but the ground fruit is less active, and is of service in medicine, both for external and internal medication.

Externally, capsicum is used as an irritant to cause redness of the skin or to blister, thus affecting related visceral areas within the body. It is thus employed in bronchitis, in early stages of pneumonia, in pleurisies, and in joint and nerve affections. Internally, capsicum is used to stimulate the appetite and to increase the amounts of gastric and intestinal juices. It is particularly serviceable in the gastritis of alcoholism. All capsicum should be excluded from the diet of patients with disease of the kidneys or acute disease of the genito-urinary system.

Cap'stan (Fr. *cabestan,* probably from a derivative of Lat. *capistrum,* a halter, from *capere,* to hold), an apparatus constructed on the mechanical principle of the wheel and axle, used for moving heavy weights and by various methods for the application of power. Its axis, unlike that of the windlass, is vertical. The capstan may be operated either by steam-power or by means of a lever set in its socket and worked by horses or pushed by hand, the last method usually requiring several men. When used elsewhere than on shipboard, the capstan generally has some specific name. Thus, when employed for raising coal from pits it is commonly called a gin; if worked by horses, it is known as a whim-gin. Capstans were formerly made of wood, but are at present almost universally of iron. The upright barrel of a capstan is constructed around a spindle. The barrel is sometimes smooth, and sometimes for increase of friction has, running up and down its surface, ribs or ridges called whelps. In the capstan-head or drum-head, surmounting the barrel, are holes for the levers or capstan-bars used to revolve the barrel. Being smaller at its centre than at the top or bottom end, the barrel has a curve from above and below, whereby a rope wound by working the capstan slips toward the concave part so formed. By this device a length of rope may be compactly and securely wound and kept in place for repeated use. On the circumference of a pawl-head at the bottom of the barrel are pivoted pawls which catch a pawl-rim or ratchet-ring fastened to the platform or floor on which the capstan is fixed. There are various other devices for increasing friction, the prevention of slipping, and reverse operation of the mechanism.

Cap'sule, in botany, a dry fruit containing several seeds, sometimes a large number, and opening of itself by means of valves or pores when it comes to maturity. According as it contains one, two, three, or more cells, the capsule is called unilocular, bilocular, trilocular, etc., and when it has many cells it is called multilocular.

In anatomy a capsule is a mass of fibrous, connective tissue cells surrounding or supporting an organ, either as a bag, as is the case in the kidneys; or as a framework, as in the liver. The capsule is usually an integral portion of the structure of an organ.

In pharmacy gelatin capsules are widely used for purposes of rendering medicines tasteless.

Captain. This is one of those many words derived from the Latin of the Middle Ages, and now to be found in all the different idioms of Europe. Captain comes from the Latin *capitaneus,* from *caput,* head, and signified, first, a governor of a province, who in the first half of the Middle Ages was generally a military man. Thus the word captain soon came to be used chiefly to denote a high, or rather the highest military officer. Like many other words, however, this has in the course of time lost much of its dignity, and in military technology now signifies the commander of a small body, a company, and in maritime language the master of a vessel. In the navy it indicates a specific rank, the captain being distinctively the officer commanding a war-vessel. In the latter part of the Middle Ages, when armies were not yet so regularly divided and subdivided as at the present time, captains were the commanders of those small bodies of which the armies consisted. These were generally collected by their commander, who entered with his company into the service where most pay or most booty could be obtained. The practice of carrying war by troops collected in this manner prevailed to the greatest extent in Italy, where the continual quarrels of the numerous small states afforded ample employment to the unsettled and the dissolute. These companies play an important part in the history of the Middle Ages, particularly that of the two centuries preceding the Reformation, and had a very important influence on

the manners and morals of the south of Europe. They are further interesting to the student of history, because they are so unlike anything at present existing.

CAPTAIN, in modern armies, is the commander of a company of foot or a troop of horse. In the United States army he nominates the sergeants, corporals, and lance-corporals of his company, who are appointed by the commander of the regiment.

CAPTAIN, in the navy, an officer commanding a ship of war. The naval captain is next in rank above the commander, and in the United States ranks with a colonel in the army.

CAPTAIN-GENERAL, the commander-in-chief of an army or of all the military forces of a country. In France it was an ancient title which conferred an almost unlimited power on the person who possessed it in the district where he commanded. But it never corresponded to that of generalissimo except in the case of the Duke of Savoy, in 1635, in the time of Louis XIII. The title is not in use at present, nor would it agree with the existing organization of the administration. In Spain the rank of a captain-general corresponds with that of a marshal of France, the captain-general having command of an army or army-corps. The title was also given to the head of a province in the Spanish colonies in South America, which were divided into viceroyalties and captain-generalships (*capitanias-generales*); thus Chile used to be a captain-generalship. The captains-general were not placed under the viceroys, but accountable only to the king through the council of the Indies. The captain-general of Venezuela, for instance, had no connection with the viceroy of New Granada. They decided, in the last instance, on all legislative, judicial, and military affairs, and presided in the *real audiencia*. The time during whch these governors remained in power was limited to a few years, probably in order to prevent them from becoming too powerful. The consequence was, that the colonies were oppressed the more to enrich the governors, for rich every one was when he left his office.

CAPTAIN of a merchant ship, he who has the direction of a ship, her crew, lading, etc. In small vessels he is more ordinarily called master, which indeed is the correct title.

Caption, in law, signifies that part of a legal instrument such as an indictment or commission, which states when, where, and by what authority it is executed. In Scotch law it signifies a warrant of imprisonment issued against a party to enforce an obligation, being now confined to a warrant served upon a party who has illegally retained papers in a lawsuit that had been borrowed by him, and intended to compel the return of the papers.

Capua, kā'poo ā, Italy, a city in the province of Caserta, 18 miles north of Naples, on the Volturno, which is crossed by a handsome bridge. The district is very fertile, but somewhat unhealthy. It is the seat of an archbishopric, and is the principal fortress that covers the approach to Naples. It has two magnificent gates, three principal streets, two handsome squares, and three public fountains. The town is dirty and badly built. The principal public buildings are the cathedral, with a cupola supported by 18 columns, entirely modernized; the church of the Annunciation; the governor's palace, the town-hall, a museum with many ancient works of art, etc. The ancient city was situated two and a half miles southeast from the modern town, which was built from its ruins on the site of the ancient Casilinum by the Lombards in the 9th century. The site is now occupied by a considerable town, called Santa-Maria-di-Capoa-Vetere. The ancient Capua, one of the finest and most agreeable cities of Italy, was of such extent as to be compared to Rome and Carthage. Hannibal wintered at ancient Capua after the battle of Cannæ, and thus not only lost time, but also is commonly said to have rendered his army unfit to follow up the advantage he had gained. It was a favorite place of resort of the Romans, on account of its agreeable situation and its healthy climate; and many existing ruins attest its ancient splendor. In 456 A.D. it was devastated by the Vandals under Genseric, and in 840 the Saracens completely destroyed it. Pop. about 14,000.

Capuana, Luigi, loo-ē'jē kä-poo-ä'nä, Italian poet, novelist, and critic: b. Mineo, Sicily, 27 May 1839. Having devoted himself to journalism, he settled in Florence in 1864, where he wrote dramatic criticisms; from 1868 until 1877 he lived in his native town, then in Milan, again as a journalist. His best-known work is 'Giacinta' (1879), a naturalistic novel. Besides this he has published several volumes of short stories, among them: 'Profiles of Women' (1881); 'Homo' (1883); and two collections of charming fairy tales: 'Once upon a Time' (1882) and 'Fairy Land' (1883). A curious specimen of rhythmical prose is his 'Semi-Rhythms' (1888), in praise of worldly joy and beauty.

Capuchin, kăp ū shĕn or kap ū chĕn, the name of several animals in which the growth of the hair or feathers upon the head forms a sort of hood suggesting that of a Capuchin friar. Certain monkeys are so called, especially the South American sapajous (q.v.) and one or more of the macaques (q.v.). A breed of domestic pigeons is also so called.

Capuchins, an order of mendicant friars in the Roman Catholic Church founded in 1528 in virtue of a bull of Clement VII. Its founder, Matteo Barro, was a member of the rigorist section of the Observantine Franciscans, who sought to restore the rule of perfect poverty and humility, and to be of aid to parish priests in the cure of souls. The Capuchin friars obtained their name from the capuerce, cowl, or hood which they wore. They were vowed to live according to the rule of St. Francis in hermitages and to labor for the conversion of notorious sinners. Their churches were to be bare of ornament. Soon after their foundation they did heroic service in ministering to those stricken by the plague which at that time ravaged all Italy. The third vicar-general of the order, Bernardino Ochino (q.v.) brought the Capuchins into discredit by his notorious leanings toward protestantism, and the fraternity was interdicted from preaching by Paul III., and would have been suppressed had not Cardinal Sanseverino, archbishop of Naples, interceded for them. Paul also forbade them to establish any convents beyond the Alps, but his successor, Gregory XIII., revoked that decree. Again, Gregory XIV. in 1591 withdrew from them the fac-

ulty of ministering in the confessional; but it was restored to them 10 years later by Clement VIII. Finally, in 1619 the fraternity was restored to good standing, and was even erected into an order administratively independent of the general of the Franciscans, and their vicar-general assumed the style of minister-general. Ever since, the Capuchins have been recognized as eminently useful servants of the Church. The order conducts missions in all quarters of the globe, and has the reputation of being very successful in winning converts.

Cap'ulets and Mon'tagues, the English spelling of the names of the Cappelletti and Montecchi, two noble families of northern Italy, according to tradition of Verona, chiefly memorable from their connection with the legend on which Shakespeare has founded his tragedy of 'Romeo and Juliet.'

Ca'put Mor'tuum (Latin), literally, a dead head; a fanciful term much used by the old chemists to denote the residuum of chemicals when all their volatile matters had escaped; hence the word is figuratively used of anything from which all that rendered it valuable has been taken away.

Caputiati, kă-pū-shĭ-ā'tī, a Christian sect which arose in France in the 12th century. They wore on their heads a leaden image of the virgin Mary. They wished liberty, equality, and the abolition of all civil government. Hugo, bishop of Auxerre, suppressed them by military force.

Capybara, kă-pē-bä'ra, an aquatic rodent (*Hydrochoerus capyoara*), of the family *Caviidæ*, native to South America. It is the largest rodent known, being four feet long, and weighing nearly 100 pounds. It has a rough brown coat, a heavy flat head, small, pig-like eyes and ears, and a blunt muzzle. Its feet are supplied with hoof-like claws, and its tail, unlike that of most rodents, is very short. The animal is herbivorous, browsing on grass along river banks, and often creating havoc in sugar plantations. It is awkward on land, but swims and dives well, and can remain under water a long time. The flesh is edible, except that of very old males.

Carabao, kä-ra-bä'ō. See BUFFALO.

Car'abas, Marquis of, the exalted personage who figures in Perrault's story of 'La Chat Botté' ('Puss in Boots'). The name is often applied to an extremely conservative aristocrat. In Disraeli's 'Vivian Grey' the Marquis of Clanricarde is satirized as the Marquis of Carabas.

Carabidæ, the family of *Coleoptera*, comprising the ground-beetles. In form the species vary greatly; the antennæ are inserted behind the base of the mandibles under a frontal ridge; maxillæ with the outer lobe palpiform, usually biarticulate, while the inner lobe is usually curved, acute, and ciliate, with spines. The epimera and episterna of the prothorax are usually distinct; the three anterior segments of the abdomen, usually six, rarely seven or eight in number, are connate. The legs are slender, formed for running; anterior and middle coxæ globular, posterior ones dilated internally, and the tarsi are five-jointed. They are, with few exceptions, predaceous and carnivorous beetles; they are runners, and do not fly, the hind wings being often absent. Their colors are dull metallic or black. They run in grass, or lurk under stones or the bark of trees, whence they go out to hunt in the night-time. The larvæ are found in much the same situations as the adult beetles, and are generally oblong, broad, with the terminal ring around, with two horny hooks or longer filaments, and with a single false leg beneath. *Carabus serratus* and *Calosoma calidum* are common examples.

Car'abine, or **Carbine.** See RIFLE.

Carabobo, kä-ra-bō'bō, a state of Venezuela, bounded on the north by the Caribbean Sea; area, 2,984 square miles. The capital is Valencia, and the chief port Puerto Cabello. Coffee, cacao, and sugar are cultivated. The village of Carabobo, 20 miles southwest of Valencia, was the scene of the battle fought 24 June 1821, which was decisive of the independence of Colombia. Caracas, La Guayra, Carthagena, Cumana, and all that portion of Venezuela which is dependent upon them, were permanently secured to the patriots by this victory. Pop. (1900) 225,000.

Caracal, kăr'a kăl, a lynx-like wild cat of Africa and southern Asia, slender in form and usually red-brown in color. See LYNX.

Caracal'la, Roman emperor: b. Lyons, 188 A.D.; d. 217. His real name was MARCUS AURELIUS ANTONINUS BASSIANUS, and he was the eldest son of Septimius Severus. On the death of his father he succeeded to the throne with his brother, Antoninus Geta, whom he speedily murdered. To effect his own security upward of 20,000 other victims were butchered. He was himself assassinated by Macrinus, the pretorian prefect, near Edessa, in 217. Among the buildings of Caracalla in Rome, the baths — *Thermæ Caracallæ* — near Porta Capena, were most celebrated, and their ruins are still magnificent.

Caracara, kä-ra-kä'ra, a genus of large carrion-eating hawks of the tropical parts of America, with black and white plumage, the head somewhat crested, legs long and naked and the general aspect vulture-like. They have increased greatly with the spread of the cattle-raising industry in South America, and have proved of much service as scavengers about the ranches and villages. The species to which the name most strictly applies is *Polyborus cheriway*, which is found from Venezuela to Texas and southern California. Another prominent species is the carancho (*P. tharus*) numerous and well known all over Brazil and Argentina. Darwin gives interesting facts in regard to this and related vulture-hawks in his journal. Compare CHIMANGO.

Caracas, kä-rä'käs, city and capital of the United States of Venezuela, was founded in 1567 by Diego de Lozada, who called the city Santiago de Léon. But in popular usage a more distinctive name was adopted — that of the Caracas tribe of Indians, formerly inhabiting the valley in which the city is built. Its altitude being about 3,000 feet above sea-level, the climate is generally mild and agreeable, the temperature seldom rising above 82° F. (with 84.2 as a maximum), or falling below 65° F. (with a minimum of 48.2). Toward the end of December the temperature is lowest, and it is highest from June to September. Mean temperature, 66.2° F. Lat. 10° 32′ N., lon. 67° 4′ 45″ W.

The streets cross each other at right angles, running due east and west, or north and south, and the principal thoroughfares are paved with stone, and have sidewalks of cement. The capitol building occupies an entire square, an area of more than two acres. It includes the halls in which both chambers of the national congress hold their sessions. The rooms of the high federal court, and the departments of public instruction and the interior are in the galleries on the east and west sides of the capitol. *La Casa Amarilla* (the Yellow House), official residence of the president of the republic, is situated west of the Plaza Bolivar. On the north side of the same square is the main post-office. Near by are the archbishop's palace, the cathedral, and the municipal palace. Opposite the southern façade of the capitol are the university buildings (Gothic architecture, with interior gardens); the old temple of San Francisco, and the Exposition Palace, the western wing of which contains the Bolivar Museum, the headquarters of the Academy of History, and the corresponding branch of the Spanish Royal Academy. The national library and museum are housed by the university. Other characteristic buildings are: The National Pantheon, the Masonic Temple, the three markets, the National Benevolent Institute, the Arsenal, the Institute of Arts and Trades, and the Municipal Theatre. Besides the Plaza Bolivar, the principal public squares are the Washington, Pantheon, and Fifth of July (Independence Day). The cathedral, dating from 1614; the Basilica de Santa Ana, and the Santa Capilla, are noteworthy among the churches of the city. Interesting relics of the heroes of the struggle for liberty, Miranda, Bolivar, and Páez, are shown in the National Museum. There are several promenades (called "Iron Bridge," "Paradise Avenue," and "Independence"), and among the places of amusement are a Plaza de Toros, baseball grounds, and a bicycle park. An important institution supported by the government is the Vargas Hospital. The Linares Hospital for children is maintained by private contributions. Leading clubs are the Union, German, Italian, and Agricultural. Street railways are controlled by the Caracas and Bolivar companies. The city has cheap telephone service, furnished by two companies, and is lighted by gas and electricity. All telegraph lines throughout the republic are owned by the government. Four lines of railway start at Caracas, three of which are designed to place the capital in communication with the interior, while the most important runs to Port La Guayara. Pop. including the six suburban parishes making up the federal district is about 90,000.

Caracci. See CARRACCI.

Caraccioli, Francesco, frän chēs'kō kä-rä-chō'lō, Italian admiral: b. Naples, 1752; d. 29 June 1799. He was distinguished in the Neapolitan service, but entered the service of the Parthenopean Republic set up by the French republicans in 1799, and repelled a Sicilian-English fleet. When Ruffo took Naples, Caraccioli was arrested, and being tried by court-martial was condemned to death, and hanged at the yard-arm of a Neapolitan frigate. The court-martial was ordered by Nelson, to whom the king had given command of the Neapolitan navy.

Carac'tacus, British king. He was a son of Cunobelin, king of the Trinobantes, and in 43 A.D., when Plautius landed, was at the head of the Catuvellauni. Plautius and his lieutenant Vespasian, who afterward became emperor, defeated the British forces under Caractacus on several occasions, the chief battle probably taking place about Wallingford. When the Romans had pushed well down the Thames the Emperor Claudius arrived and took part in further military operations, but his stay was a very short one. Caractacus now established himself in South Wales among the Silures, whence he took every opportunity of harassing the Romans. In 47 A.D. Plautius was replaced by Ostorius Scapula, and that commander completely defeated Caractacus in a battle somewhere about Shropshire, probably at Caer Caradoc. The wife, daughter, and brothers of the British leader were captured, and Caractacus himself fled to the country of the Brigantes in the north, only to be delivered up by their queen Cartismandua into the hands of the Romans. He was taken to Rome and made to take part in a triumphal procession. Here he was led before the Emperor Claudius and an assembly of the people. When he came to the seat of the emperor he stopped and addressed him, and so won upon the monarch by his noble behavior and pathetic speech that the other pardoned him. According to the Welsh Triads he lived four years longer, and his children became Christians and introduced Christianity into Britain. He is introduced among the dramatis personæ of Beaumont and Fletcher's play, 'Bonduca.'

Caradoc Sandstone, the name given by Murchison to a thickness of about 4,500 feet of sandstones, shales, grits, flags, and sandy limestones on the border between England and Wales, which he made a separate series. Subsequent investigation has shown that the Caradoc series is of the same age as the Bala, and the series is sometimes called Bala and Caradoc by English geologists. The rocks are of the Ordovician system. See ORDOVICIAN.

Carafe, kă-raf', the French name for an ordinary glass bottle or decanter for holding drinking water.

Caraffa, kä räf'fä, a celebrated Neapolitan family, which has produced several distinguished commanders and statesmen: 1. OLIVIERO, b. 1406; d. Rome, 1511. He was made a cardinal by Pope Paul II. in 1467. Sixtus IV. appointed him his legate to Alfonso of Naples, and in 1472 made him admiral of his fleet against the Turks, from whom he captured Smyrna, and the port of Satalia in Asia Minor. 2. CARLO, b. Naples, 1517; d. 1561. He served first in the Netherlands under the Spaniards, then entered the order of Malta, and was made a cardinal by his uncle Pope Paul IV., who, for his sake, stripped the Colonnas of their possessions. This involved them in a war with Philip of Spain, but the result proved favorable to the Caraffa family. Paul IV. was succeeded by Pius IV., who was a bitter enemy of the Caraffas, imprisoned them, and then caused the cardinal to be strangled. 3. ANTONIO, b. Naples, 1538; d. 1591. He was made cardinal by Pius V., and intrusted with the superintendence of the congregation for the revision of the Bible, and an Exposition of the Canons of the Council of Trent. Under Gregory XIII. he became libra-

rian of the Vatican. He translated Theodoret's Commentaries on the Psalms, and the Orations of Gregory Nazianzen from Greek into Latin. 4. ANTONIO, another member of the family, distinguished himself in Hungary in the service of Austria, but made himself universally hated by his cruelty. D. Vienna, 1693.

Carambola, kä-ram-bō'la, the fruit of an East Indian tree of the same genus as the bilimbi, the *Averrhoa Carambola,* order *Oxalidaceæ.* It is of the size and shape of a duck's egg, of an agreeable acidulous flavor.

Car'amel. When sugar is gradually heated, it loses water and other substances, and is converted into a dark mass with a characteristic smell and taste. This is crude caramel, which is used in cookery as a coloring and flavoring ingredient. It is a mixture of several bodies, of which three have been described: Caramelane, a brown bitter body, soluble in water; Caramelene, a dark brown body, also soluble in water, and possessed of great tinctorial power; and Caramelin, a black substance, of intense coloring power, which exists both in a soluble and insoluble modification.

Carangidæ, kä-răn'jĭ-dē, a family of marine fishes, the pompanos. Among the more widely known members of the family are the leather jackets, pilot fishes, amber fishes, runners, horse mackerels, crevallés, moonfishes, and pompanos. There are about 200 species in the family, and nearly all are good for food. They abound in the warmer seas, and many of them are remarkable for their graceful or strange forms.

Car'apa, a small genus of tropical trees of the natural order *Meliaceæ,* with mostly imparipinnate leaves and regular flowers. A South American species (*C. guianensis*) is a fine large tree, whose bark is in repute as a febrifuge. Oil made from its seeds (called carap-oil or crab-oil) is used for lamps, and masts of ships are made from its trunk. The wood is called crab-wood. The oil of the African species (*C. tolucana*), called *coondi, kundah,* or *tallicoona* oil, is used by the negroes for making soap and anointing their bodies in order to protect them against insects. The oil of the South American carapa is used for the same purpose also.

Car'apace, the upper part of the hard shell or case in which reptiles belonging to the order of the *Chelonia* are enclosed, the lower part being called plastron. The same name is also given to the upper part of the shell of the Crustacea, and to the case inclosing certain of the *Infusoria.*

Car'at is said to have derived its name from *qirrât,* which in Arabic signifies the pod of a leguminous plant, the seeds of which have, from time immemorial, been used in the East in weighing gold, because they never vary in weight when once dry. It is a weight of three and a sixth troy grains, used in weighing pearls and precious stones, and also serves to express the relative fineness of gold. Twenty-four carats being assumed as the standard of gold perfectly free from alloy, every specimen, in proportion as it falls short of this purity, has a fineness of less than 24 carats — for example, if the alloy amounts to a sixth of the whole, it is 20 carats fine; or to a fourth, it is 18 carats fine.

Carausius, kä-rô'shĭ-ŭs, Roman general: b. among the Menapii, in Gallia Belgica. He was sent by the Emperor Maximian to defend the Atlantic coasts against the Franks and Saxons; but being suspected of permitting those pirates to commit their ravages in order to increase his own plunder when he afterward captured their vessels, and foreseeing that he was likely to fall into disgrace, he landed in Britain and had himself proclaimed emperor by his legions (287 A.D.). In this province he was able to maintain himself six years, when he was assassinated by one of his officers named Allectus (293 A.D.).

Caravaca, kä-ra-vä'ka, Spain, a town in the province of Murcia, and 43 miles west by north of the town of Murcia. It occupies the side of a hill crowned by an ancient castle, and overlooking the river Caravaca, here crossed by a stone bridge; is well built, and has a handsome town-house and church, the latter with a lofty tower and some good sculptures and paintings. Its trade is chiefly in cattle, grain, and manufactures of woolen and hempen goods, paper, soap, earthen and copper ware. Pop. 16,000.

Caravaggio, da, Michelangelo Amerighi, or **Merighi,** mē'kĕl än'yō lō ä-mĕr-ē'jē or mĕr'ē jē kä rä väd'jō, Italian painter: b. Caravaggio, in the Milanese, 1569; d. near Porto Ercole, 1609. He was at first a journeyman mason, but soon applied himself to the study of painting, studied in Milan and Venice, and afterward went to Rome, where he distinguished himself. He may be considered as the inventor of a manner which has had a crowd of imitators. His characteristic traits are vigor and truth of *chiaroscuro,* combined with excellent coloring. He was fond of introducing broad and deep masses of shade, whereby a great effect is given to the light. To aid him in producing this effect the room in which he worked was illuminated by a skylight, and the walls were painted black. He excelled in the painting of naked figures. His faults are obvious. Narrow and servile imitation of nature was his highest aim. Annibale Caracci and Domenichino were, perhaps, less distinguished than Caravaggio during their lives, but after their death were ranked higher; because, without neglecting coloring and the study of nature, they aimed at correctness of design and dignity of conception. His violent character involved him in many difficulties. He died in consequence of wounds received in a quarrel in which his violent nature had involved him. The painters who have imitated him most are Manfredi, Valentin, and Ribeira, called *Espagnolet.*

Caravaggio da Polidoro, Italian painter: b. Caravaggio, 1495; d. 1543. His real name was CALDARA, but he was surnamed CARAVAGGIO from his birthplace. He went to Rome in his youth and carried bricks at first for the masons who worked in the Vatican. He first felt a great desire to become a painter from seeing Giovanni da Udine and the other painters who were occupied in the Vatican. He formed a close friendship with Maturin of Florence, who assisted him with his advice. Caldara soon surpassed him, and exerted himself to introduce improvements in drawing, having always in view the antiques. Raphael employed him in the galleries of the Vatican, where he painted,

under his direction, several excellent friezes. At Messina he executed an oil-painting, representing Christ bearing the cross, which contains a number of beautiful figures, and proves his ability to treat the most elevated subjects. He has approached more than any one to the style and the manner of the ancients, particularly in imitating their bas-reliefs. His figures are correct, well distributed and arranged; the positions are natural, the heads full of expression and character. It is evident that he would have acquired great celebrity if he had undertaken greater works. He applied himself to the *chiaroscuro,* particularly to that kind of it which is called *sgraffiato.* He showed, also, much talent in his landscapes. At the sack of Rome in 1527 he fled to Naples, and on his return from that place to Rome, in 1543, he was murdered by his domestic.

Caravaggio, Italy, a town and commune in Lombardy, 24 miles east of Milan, on the Gera d'Adda. It is celebrated as the birthplace of the two great painters, Polidoro Caldara and Michelangelo Amerighi, both called *da Caravaggio.* It was formerly surrounded by walls and defended by a strong castle. Its principal church has some good paintings. The commune is famous for its melons. Pop. about 10,000.

Car'avan, or **Karavan,** a Persian word, used to denote large companies which travel together in Asia and Africa for the sake of security from robbers, having in view, principally, trade or pilgrimages. Such a company often have more than 1,000 camels to carry their baggage and their goods. These walk in single file, and the line is often four or five miles long. To avoid the excessive heat, they travel mostly early in the morning. As every Mohammedan is supposed to visit the tomb of Mohammed once at least during his life, caravans of pilgrims go to Mecca every year from various places of meeting. Of the various caravans which proceed to Mecca every year, the most important has always been the Syrian. The place at which it meets is Damascus, and here the pilgrims and merchants assemble many weeks before the day of departure, which is always fixed according to the season of the year in which the feast of Bairam occurs, the pilgrims requiring to be at Mecca on the day of the feast. As these caravans serve mercantile as well as religious purposes, Mecca, on the arrival of the caravans, resembles a great fair, and this fair is indeed the most important in all the East. The journey from Damascus to Mecca and back occupies about four months. The leader of such a caravan to Mecca, who carries with him some cannon for protection, is called *Emir-el-Hadj* (Prince of the Pilgrims). Trading caravans choose one of their own number for a leader, whom they call Caravan Bashi. Much information on the subject of caravans is to be found in the travels of Niebuhr, who made many journeys with them, and describes them, as it is well known, minutely and faithfully.

Caravansari, kă-ra-văn'sa-rĭ, in the East, a sort of inn, situated in countries where there are no cities or villages for a considerable extent, to furnish travelers with a shelter. Some of them are built with much splendor, though they are generally unfurnished, and the traveler is obliged to bring with him not only his bed and carpet, but also all his provisions and necessaries. In many, the hospitality is gratuitous. It is common for a pious Mohammedan to establish, during his life or by will, one or several of such caravansaries. This kind of benevolence is considered peculiarly agreeable to the deity, and promotive of the eternal happiness of the founder. Sometimes persons are kept in these establishments to guide the caravans for some distance. See KHAN.

Car'avel, formerly the name of different kinds of vessels; one used in Portugal of 100 to 150 tons burden, another a French fishing vessel used on the coasts of Normandy and Picardy of 10 to 15 tons, and a third a large Turkish ship of war.

Carawala, kä-ra-wä'la, a large viper (*Hypnale nepa*) of Ceylon and southern India, numerous, and greatly dreaded by the natives, especially those who work in the pineapple plantations. Its poison has the peculiarity of not affecting the system until several days after the bite, so that proper remedies immediately applied will counteract the venom.

Car'away, an umbelliferous biennial plant (*Carum carui*), with a tapering fleshy root, a striated furrowed stem, and white or pinkish flowers. It produces a well-known seed used in confectionery, and from which both a carminative oil is extracted and a spirit cordial distilled. The two species found in America are the descendants of naturalized European plants, that have escaped from cultivation. It is largely grown in England, on strong and rich clays, and is sometimes sown with beans, but more usually with coriander and teazel, or coriander alone. After the coriander, which is only a preparatory crop, has been removed, the plants of the caraway are singled out and repeatedly hoed and cleaned. It is cut about the beginning of July, and produces on an average about 900 pounds per acre. It is a favorite crop with the Dutch. The volatile oils in caraway render it of much service in medicine. The action of these oils is to stimulate peristalsis and thus overcome flatulency. They are further antiseptic and check excessive intestinal putrefaction. They act also as mild local anæsthetics and are useful in nausea and vomiting.

Carayon, Auguste, ô-güst kä-rā-yŏń, French historian: b. Saumur, 31 March 1813; d. Poitiers, 15 May 1874. A distinguished Jesuit, he wrote: 'First Canadian Missions of the Jesuits' (1864); 'Banishment of the Jesuits from Louisiana' (1865); and similar studies.

Carbajal, Francisco, frän-thēs'kō kär-bä-häl', Spanish soldier: b. Alavaro, 1464; d. near Cuzco, 10 April 1548. He served in the army in Europe; went to Mexico in 1528; and when Pizarro appealed for help against the Inca uprising he was one of the force sent by Cortez to Peru. He was marshal under Vico de Castro, in the battle of Chuas. He later took office under Gonzalo Pizarro, in the war against Diego Centeno and De la Gasca. At first he was triumphant over Centeno in the Collao, but at the battle of Sacsahuana, 8 April 1528, he was taken prisoner with Pizarro and executed. He was extremely cruel in his treatment of his enemies, but was not less noted for his humor which never failed him, not even at his own execution.

Carballo, kär-bäl'yō, Spain, a town in the province of Corunna, situated 24 miles northwest of Santiago. It has warm mineral springs and baths. Pop. 13,500.

Carbazo'tic Acid. See PICRIC ACID.

Car'berry Hill, Scotland, a rising ground in Mid-Lothian, about seven miles southeast of Edinburgh, between Musselburgh and Ormiston, where Mary, Queen of Scots, surrendered herself to the confederate nobles of the kingdom, 15 June 1567, just before her confinement in Loch Leven Castle.

Car'bide, in chemistry, a binary compound of carbon with a metallic element, or with certain of the non-metallic elements. Of the known carbides those of iron and calcium are most important. Carbide of iron occurs in steel, and is undoubtedly concerned in some manner, with the hardening of that metal; although the authorities are not agreed as to the precise role that it plays. The best known carbide of iron is the one having the formula CFe_3; but Campbell has shown ('American Chemical Journal,' XVIII., 836) that a series of iron carbides probably exists, having the general formula C_nFe_{3n}, and corresponding in a certain sense to the hydrocarbon series C_nH_{2n}; so that when any one of the carbides of iron is treated with an acid, the corresponding hydrocarbon is set free. Calcium carbide is formed by the action of carbon upon lime at the temperature of the electric furnace. It has the formula CaC_2, and its commercial value depends mainly upon the fact that it is readily decomposed by water, with the copious liberation of acetylene gas (q.v.). Carbide of magnesium is not formed at the temperature of the electric furnace, probably because it is not stable at that temperature. It may be prepared, however, by the action of calcium carbide upon magnesium fluoride, in accordance with the equation $CaC_2 + MgF_2 = CaF_2 + MgC_2$. Like calcium carbide it is decomposed by water with evolution of acetylene gas, the yield being 50 per cent greater, per pound of the carbide, in the case of magnesium carbide. It is not unlikely that magnesium carbide will one day replace calcium carbide for the production of acetylene gas, on account of the larger yield; but this substitution cannot be made on a commercial scale until some cheaper mode of manufacture is found. The chemistry of the carbides is still in its infancy, but within the past few years, and largely owing to the splendid work of Moissan, many new bodies belonging to this class have been discovered. Gold, bismuth, lead, and tin do not form carbides at the temperature of the electric furnace, nor do they dissolve carbon at that temperature. Platinum and iridium dissolve carbon freely, but deposit it again, upon cooling, in the form of graphite. Aluminum absorbs carbon freely, with the formation of Al_4C_3, and similar results are obtained with many other metals and metallic oxides. The carbides of chromium, molybdenum, titanium, tungsten, and zirconium do not decompose water. Those of calcium, strontium, barium, and lithium decompose it with liberation of pure acetylene; but the carbides of aluminum and beryllium yield pure methane, and carbide of manganese gives a mixture of equal parts of methane and hydrogen. Other carbides decompose water with more complex results. Thus the carbides of the rare metals of the cerium group yield complicated mixtures of hydrogen, acetylene, methane, and ethylene, and the carbide of uranium gives all these products (except, perhaps, acetylene), and, in addition, copious quantities of various liquid and solid hydrocarbons. The carbides of sodium and potassium, which are best prepared by passing dry acetylene gas over the corresponding metals at a temperature of about 450° F., decompose water with liberation and acetylene. The carbides of titanium and of silicon are characterized by extreme hardness, and it is said that they will even cut the diamond with facility. Carbide of silicon is an exceedingly stable substance, and is now largely used, under the trade name of «carborundum,» as an abrasive material in the manufacture of grinding-wheels, whetstones, and polishing-cloth.

Moissan's researches with the electric furnace are reported chiefly in the 'Annales de Chimie et de Physique,' and useful reviews of them have been printed at frequent intervals in 'Nature.' Moissan claims to have been the discoverer of the crystalline carbide of calcium that is now commercially familiar; but in the United States this honor is usually accorded to Mr. Willson, whose labors were certainly quite independent of those of Moissan. See ACETYLENE; CALCIUM; CARBIDE; CARBORUNDUM.

Carbohy'drate, in chemistry, a compound consisting of carbon, hydrogen, and oxygen, and having the general formula $C_{6n}H_{2p}O_p$. As will be seen, the number of carbon atoms in a carbohydrate is always divisible by six, and the oxygen and hydrogen are present in the same proportion in which they occur in water. It is not implied, however, that the compound contains water as such, but only that the oxygen and hydrogen atoms are present in the proportion of two atoms of the latter to one of the former. It will also be observed that a carbohydrate and a hydrocarbon are two essentially different things, inasmuch as a carbohydrate contains oxygen, while a hydrocarbon is a compound containing no element but carbon and hydrogen.

The carbohydrates constitute a large and very important class of substances, embracing the starches, sugars, glucoses, and gums. Their chemical relations are intricate, and are far from being thoroughly understood. Several schemes have been proposed for their classification, but owing to the present imperfection of our knowledge none is entirely satisfactory. The classification proposed by O'Sullivan is convenient, however, and will be adopted here.

Class 1.— SACCHARANS: Amorphous substances, having the general formula $nC_6H_{10}O_5$, soluble in water but insoluble in alcohol, and further characterized by the fact that when they are treated with acids they yield substances of the type $nC_6H_{12}O_6$, directly, and without the formation of intermediate compounds. Dextran, lævulan, the amylans and the galactans are examples. (These bodies are gums.)

Class 2.— SACCHARENS: Substances possessing a certain amount of structure, having the general formula $nC_6H_{10}O_5$, insoluble in either water or alcohol, and transformed by the action of acids and certain ferments first into $nC_{12}H_{22}O_{11}$, and finally, by the action of acids, into $nC_6H_{12}O_6$. Cellulose, starch, inulin, and tunicin are examples; the first two

falling under "amylose" in the less elaborate classification which divides the carbohydrates merely into amylose, saccharose, and glucose.

Class 3.— SACCHARINS: Amorphous substances, having the general formula $n(C_6H_{10}O_5)$, soluble in water, but insoluble in alcohol; converted by acids first into $nC_{12}H_{22}O_{11}$, and finally into $nC_6H_{12}O_6$; and by certain ferments into $nC_{12}H_{22}O_{11}$. Glycogen, dextrin, and malto-dextrin are examples.

Class 4.— SACCHAROSES (sugars).

Group (*a*).— SACCHARONS: Sweet, crystallizable bodies, soluble in water and in moderately strong alcohol, having the general formula $nC_{12}H_{22}O_{11}$, and convertible by acids and sometimes by ferments into $nC_6H_{12}O_6$. Sucrose (cane sugar), lactose (milk sugar), maltose, and raffinose are examples.

Group (*b*).— GLUCOSES: Substances crystallizing, though not so readily as the members of the preceding group; having the general formula $nC_6H_{12}O_6$; soluble in both water and alcohol; and converted by the prolonged action of acids into substances that are no longer carbohydrates. Some of these, such as dextrose, lævulose, and galactose, are fermentable by yeast; while others, such as sorbinose, are not fermentable.

Group (*c*).— Certain substances, such as inosite and scyllit, which probably belong in the aromatic series and bear no special resemblance to the other members of the carbohydrate family.

O'Sullivan has also a fifth class, including those substances which, though they may not be carbohydrates in the strict sense, are nevertheless closely allied to the carbohydrates and are easily converted into them. In this class he places the glucosides and certain of the gums, mucilages, and pectins.

The carbohydrates are exceedingly important elements in the world's food supply, and may indeed be said to be essential to the maintenance of life. They are practically all of vegetable origin, and are derived ultimately from certain simple fundamental substances that are formed in the green leaves of plants. Under the influence of sunlight the chlorophyll contained in the leaves is competent to split up the carbon dioxide of the air, retaining the carbon and setting the oxygen free. The carbon that is abstracted in this way is caused to combine with the water that the leaves contain, with the production of carbohydrates; but the identity of the carbohydrate that is first formed in this way, and which serves as the starting-point for the others, is not yet established. According to the views of Sachs the "first obvious product" is starch, the formation of which he explained by the equation

$$\underset{\text{Carbon Dioxide}}{6CO_2} + \underset{\text{Water}}{5H_2O} = \underset{\text{Starch}}{C_6H_{10}O_5} + \underset{\text{Free Oxygen}}{12O}$$

It appears more likely, however, that formic aldehyde, CH_2O, is the first product, as is indicated by the equation

$$H_2O + CO_2 = CH_2O + 2O,$$

and that the subsequent products are built up by polymerization.

Carbohydrate metabolism is one of the most important physiological processes of the animal body. The carbohydrates are the chief source of energy and heat in the body. Most of the carbohydrates are converted into maltose by the digestive processes. This, by the action of absorption and assimilation, becomes dextrose, which sugar is the only normal sugar of the circulating fluids and the tissues. The dextrose is taken up by the blood, conveyed to the liver by the portal vein and stored up in the liver cells. Some of the dextrose is also stored in muscle, and certain portions of it are utilized by the nucleoproteids of the body. The fate of the glycogen of the body is to be oxidized into carbon-dioxide and water. The steps of this process of oxidation are very much involved, but it seems certain that an oxidizing ferment, perhaps from the adrenal glands, acting in conjunction with the pancreas, is largely influential in the process. A failure to bring about sufficient oxidation of the sugar in the body causes the well-known symptom of glycosuria, one of the features of diabetes (q.v.).

Carbol'ic Acid, a substance having a formula $C_6H_5.OH$, possessing feebly acid properties, and occurring chiefly in that part of the distillate from coal-tar which passes over at temperatures between 330° F. and 375° F. Chemically, carbolic acid has the structure of an alcohol (q.v.), and is an aromatic compound derived from benzene by the substitution of the hydroxyl group, OH, for one of the typical hydrogen atoms. It is also known as phenol, phenyl hydrate, or phenyl alcohol.

Carbolic acid, in the pure state, crystallizes in white, deliquescent needles, having a strong characteristic smell slightly suggestive of tar. It melts at 106° F., and boils, under ordinary atmospheric pressure, at about 360° F. Its specific gravity is about 1.07. It dissolves in alcohol, ether, and many other organic liquids, but is only moderately soluble in water under ordinary atmospheric conditions. It readily absorbs a small quantity of water from the air, forming a hydrate which is fluid at temperatures above 63° F. If the liquid so formed is shaken with water, the greater part of the carbolic acid separates out upon standing, and the vessel is found to contain an upper layer consisting of water in which a small amount of carbolic acid is dissolved, and a lower layer of carbolic acid in which a little water is dissolved. It does not exhibit very marked acid properties, but dissolves in the alkalis with the formation of salts called phenates. It does not have a strong affinity for the alkaline bases, however, and from a strong solution of sodium phenate (for example) it may be again separated in the form of an oily liquid by the addition of another acid; the new acid appropriating the base to itself, and setting the carbolic acid free. A solution of carbolic acid, even when very weak, develops a red color when boiled with a solution of mercurous nitrate and nitrous acid. This reaction, which serves for the detection of carbolic acid, is said to be delicate enough to indicate one part of the acid in more than 100,000 parts of water.

In medicine, carbolic acid has many uses. It is highly poisonous to living matter, and is used extensively to kill bacteria. In surgery it is used an an antiseptic dressing in proportions

of from ½–2 parts of acid to 100 of water. It, or some of its derivatives or allies, is used to sterilize instruments and to disinfect wounds, rooms, and dejecta. Internally, carbolic acid is used as a bactericide, limiting excessive intestinal putrefaction. It is also an anæsthetic, and is at times of service in irritability of the stomach. When used in too concentrated a solution it is an active caustic, causing a white, painless burn. Alcohol is an excellent antidote. Taken internally in pure form in doses over two to three drops it causes poisoning with a characteristic series of symptoms. There is burning in the mouth, fauces, œsophagus, and stomach. The whitish scars of the lips and mouth are characteristic. There is great pain, with vomiting of large quantities of mucus. There is usually ringing in the ears, headache, vertigo; the urine may be suppressed, reddish or greenish; and death results with small, rapid pulse, collapse, and, may be, convulsions. Similar symptoms may develop slowly in sub-acute forms of poisoning. The urinary symptoms usually lead to the diagnosis. The treatment of the acute form of poisoning is the free use of gastric lavage, ingestion of alcohol, and the use of lime water. Symptomatic treatment and careful nursing are necessary for other symptoms.

Car'bon, a non-metallic element, existing in nature in large quantities, both in the free and combined states. It exhibits marked allotropy, at least three distinctly different forms of it being known. These are (1) amorphous carbon; (2) graphite; and (3) diamond. Amorphous carbon is formed when wood or coal or almost any vegetable matter is heated strongly, out of contact with the air, and is familiar to everybody as charcoal, coke, and lampblack. Graphite (q.v.) occurs native, and may also be artificially prepared in various ways. Diamond (q.v.), which is crystallized carbon, also occurs native in certain regions, and pure specimens that are devoid of color, or which have certain special tints, are highly esteemed as gems.

Carbon has the chemical symbol C, and an atomic weight of 12.0 if O = 16, and 11.91 if H = 1. The specific gravity of diamond is 3.51, that of graphite is from 2.11 to 2.26, and that of hard gas-coke is about 2.35. The linear coefficient of expansion of diamond (Fahrenheit scale) is 0.00000066 at ordinary temperatures, and that of graphite is 0.0000044. Graphite has an electrical conductivity of about one twelfth, and hard gas-coke about one one-hundredth, when the corresponding conductivity of mercury is taken as the unit. Diamond is practically a non-conductor. The specific heats of diamond and graphite are quite different at ordinary temperatures. Thus at 50° F. diamond has a specific heat of 0.113, graphite 0.160, and wood charcoal about 0.165. These values increase as the temperature rises, and at about 1,100° F. all three varieties have a common specific heat of about 0.44. Diamond occurs in regular octahedra and in forms derived therefrom, the faces of the crystals usually being more or less curved, and often marked with little pits. Graphite forms crystals that are commonly hexagonal or rhombohedral. Graphite was long believed to be a kind of lead, and is still popularly known as "black-lead."

Carbon is infusible, and insoluble in any known liquid at ordinary temperatures. It dissolves to a limited extent in melted cast iron, and in melted platinum it dissolves freely, separating out again in the form of graphite upon cooling. It is unaltered by the action of acids, except when some powerful oxidizing agent like chlorate of potassium or bichromate of potassium is also present. Chemically it is tetravalent in nearly all of its compounds. It combines with oxygen in two different proportions, with the formation of a monoxide CO, and a dioxide CO_2. It also forms, with hydrogen, a great number of compounds known as hydrocarbons (q.v.); and it combines with many of the metals to form carbides (q.v.). With hydrogen, oxygen, nitrogen, and small quantities of other elements, it constitutes the entire substance of animals and plants; and the coal beds that make our modern civilization possible are composed of vegetable remains from which the elements other than carbon have been mostly expelled by the combined action of heat and pressure.

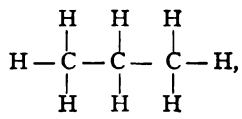
For further information concerning carbon, see AROMATIC COMPOUNDS; CARBON COMPOUNDS; CHARCOAL; COAL; DIAMOND; FATTY COMPOUNDS; GRAPHITE.

Carbon Compounds, in chemistry those compounds which contain the element carbon; and since carbon is an essential constituent of nearly all organic substances, the chemistry of its compounds is practically synonymous with "organic chemistry." Until within the past half-century it was thought by many authorities that the compounds that occur in animals and plants are essentially different in nature from those that are produced in the laboratory, and that they cannot be obtained without the action of the "vital principle." This idea received its first blow in 1828, when Wöhler prepared urea from substances that had been previously considered to be inorganic; yet as late as 1849 the great chemist, Berzelius, defined organic chemistry as "the chemistry of compounds formed under the influence of life." A vast number of substances that were formerly classed as organic have now been prepared in the laboratory, and the old classification of chemistry into organic and inorganic branches has broken down, the organic division being now more commonly and correctly called the "chemistry of carbon compounds."

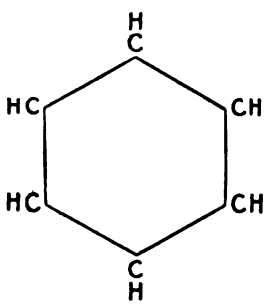
The carbon compounds form a group of great complexity, and are apparently unlimited in number. The reasons for this are that carbon is quadrivalent; that it forms multitudes of compounds with hydrogen alone, in many of which more or less of the hydrogen can be replaced by other elements, with the formation of new and altogether different substances; that its chemical bonds are apparently powerful; and that it unites with elements of the most widely different nature.

In a general way, the better-known carbon compounds are mostly divided into two great classes, according to the type of the "graphical" or "structural" formula that must be used in order adequately to represent their chemical relations. The first class includes all those bodies whose structural formulæ are distinguished by the fact that the atoms (or radicals) that are present form "open" chains, which do not any-

where return into one another. The hydrocarbon "propane," which has the structural formula



is an illustration of this class. The "open chain" compounds are called fatty compounds, and are treated under that heading. The name was originally given because many of the substances that are included in the class have long been known in connection with fats and allied bodies; but it would be more logical to call them "methane derivatives," since they may be considered to be obtainable from the hydrocarbon methane, CH_4, by a process of substitution.



The second great class of carbon compounds is distinguished by the fact that the structural formulæ that are required in order to exhibit the chemical properties of its members return into themselves, so as to form "closed" chains or rings, which (at least in the fundamental forms) contain six carbon atoms. Benzene is a familiar example. From the fact that many of the first known representatives were balsams, oils, and resins, these substances are known collectively as aromatic compounds, and are described under that heading. A better name would be "benzene derivatives," since all the members of the class are derivable from benzene by substitution.

In addition to the aromatic and fatty compounds, others are known which do not properly come under either heading. Thus the structural formula of furfuran contains a closed ring, formed by the union of four atoms of carbon and one of oxygen. Closed rings, consisting of three, four, and five atoms of carbon, are also known. The pronounced analogies and affinities that exist among the members of the aromatic and fatty groups, respectively, have forced those two groups upon the attention of chemists. Those compounds of carbon which are not strictly included within either have not yet been classified upon a similarly broad basis.

The principal phenomena of the carbon compounds are given under special headings. In addition to those already given, see, particularly, ISOMERISM; and RADICAL.

For an excellent presentation of the whole subject, see Hjelt, 'Principles of General Organic Chemistry.'

Carbon Dioxide, Carbonic Acid Gas, or Carbonic Anhydride, CO_2, is formed whenever carbon is burned in the presence of excess of oxygen or air. It is a colorless, odorless gas, soluble to a considerable extent in cold water, especially when subjected to pressure. Its solution possesses feebly acid properties, and has a peculiarly pungent taste, on account of which the aqueous solution of the acid is greatly used as a constituent of various beverages. The effervescence accompanying the opening of a bottle of beer, soda-water, or champagne, is due to the escape of the carbon dioxide that was previously held in solution. Carbon dioxide occurs in great abundance in nature, both free and in combination with various elements, in the form of carbonates. Carbonate of lime, $CaCO_3$, is one of the most common carbonates. It is formed when the gas is allowed to bubble up through a solution of lime water, and exists in nature in vast masses, as limestone and marble. (Other carbonates are described under the metals that constitute their bases.) Carbon dioxide is a constant constituent of the atmosphere (see AIR), occurring even at the tops of mountains and in the air collected from balloons. It is generated by the combustion of fuel, by respiration, by fermentation, and by the decay of animal and vegetable matter. In some localities, too, immense quantities of the gas are emitted from the ground, or from mineral springs and wells, as in the Grotto del Cane, the Cave of Montjoly in Auvergne, in the valley of Wehr, in the Eifel, and at many other places. It is being simultaneously abstracted from the air by plants, which in the sunlight decompose the gas, fixing the carbon that it contains, and setting the oxygen free. Carbon dioxide has but feeble affinity for the bases with which it combines, and is readily replaced by almost any other acid. In preparing the gas for experimental purposes the usual method is to add a dilute mineral acid to pulverized marble or other carbonate, the carbon dioxide then being liberated continuously and in large quantities. The gas is about 1.53 times as heavy as an equal bulk of air. Its critical temperature is about 90° F., and at any temperature lower than this it can be reduced to a liquid by the application of pressure.

Poisoning by this gas frequently results in closed rooms crowded with people. The symptoms may be very slight, consisting of a mild indisposition, or they may be severe — headache, nausea, vomiting, etc. In poisoning in the severer grades there is cyanosis, coma, and unconsciousness. Carbon dioxide alone is not a fatal poison; it is rendered so usually by the diminution of oxygen supply.

Carbon Disulphide, CS_2, a liquid formed when the vapor of sulphur is passed over red-hot charcoal. Under normal conditions it is a very volatile, inflammable liquid, having a specific gravity of 1.29, and boiling at 115° F. The commercial disulphide has an exceedingly disagreeable smell, but this is due to the presence of impurities. The pure liquid has a pleasant, ethereal smell. Carbon disulphide (or bisulphide) does not mix with water, but it dissolves sulphur, phosphorus, caoutchouc, and many other organic bodies that are difficultly soluble in other menstrua, and it is to this property that it owes its commercial value.

Poisoning by carbon disulphide is becoming very prevalent since the use of rubber goods has become so extensive. The symptoms of acute poisoning are due to a poisoning of the blood and a central paralysive action on the nervous system. The blood action is that of a breaking up of the red blood cells, hemolysis. This results in cyanosis, pains, headache, coma, vertigo, nausea, vomiting, weakness, unconsciousness, coma, and death. Such symptoms

are rare, the poisoning developing as a rule much less rapidly. In workers in rubber factories, in which there is much vapor of CS_2, there develop disturbances of temper, pressure feelings on the head, heat, and the feeling as if the blood would burst through the skull, with headache. There may also be symptoms of irritation of the bronchi, coughing, and roughness of the voice, etc. Treatment is fresh air and symptomatic.

Carbon Monoxide, or **Carbonic Oxide,** CO, is produced, in addition to the dioxide, when carbon is burned with a limited supply of air or oxygen. It is also generated by passing carbon dioxide through a red-hot bed of carbon, in accordance with the equation $CO_2 + C = 2CO$. For experimental purposes the gas may be generated by decomposing oxalic acid by heating it with strong sulphuric acid, and passing the gases that are evolved through a solution of caustic soda to absorb the carbon dioxide that is present. Carbon monoxide is colorless, and has a density about 0.97 times that of air. It burns with a lambent, blue flame that is often seen in coal fires that have been freshly supplied with fuel.

Carbon Oxychloride. See PHOSGENE.

Carbonado, or **Carbon,** a massive, black or dark-gray variety of diamond, also called "black diamond." Though possessing the adamantine or resinous luster of the crystallized variety, it is opaque and, therefore, of no value as a gem. It is the hardest substance known and this fact makes it the most desirable for use in diamond drills; it therefore sells for as high a price per carat as one carat rough gem diamonds (q.v.). Being without cleavage it is less brittle than the crystals, and owing to its somewhat porous structure, its specific gravity is less, 3.15 to 3.29. The commercial supply comes exclusively from the province of Bahia, Brazil, where it occurs in angular fragments which occasionally show a rough cubic outline.

Carbonari, kär-bō-nä'rē (colliers, or more strictly, charcoal-burners), the name of a large political secret society in Italy. According to Botta's 'Storia d'Italia' the Republicans fled, under the reign of Joachim (Murat), to the recesses of the Abruzzi, inspired with an equal hatred of the French and of Ferdinand. They formed a secret confederacy, and called themselves carbonari. Their chief, Capobianco, possessed great talents as an orator. Their war-cry was "Revenge for the lamb mangled by the wolf!" When Murat ascended the throne of Naples he employed Maghella, a Genoese, in the department of police, and afterward as minister. All his efforts were directed to the union and independence of Italy, and for this purpose he made use of the society of the Carbonari. The ritual of the Carbonari was taken from the trade of the charcoal burner. Clearing the wood of wolves (opposition to tyranny) was the symbolic expression of their aim. By this they are said to have meant at first only deliverance from foreign dominion; but in later times democratic and anti-monarchical principles sprang up. They called one another good cousins. No general union of the order under a common head seems to have been effected. The separate societies in the small towns entered into a connection with each other, but this union extended no farther than the province. The place of assembly was called the hut (*barraca*); the surrounding neighborhood was called the wood; the meeting itself was distinguished as the sale (*vendita*). The confederation of all the huts of the province was called the republic, generally bearing the ancient name of the province. The chief huts (alta vendita) at Naples and at Salerno endeavored to effect a general union of the order, at least for the kingdom; but the attempt appears to have been unsuccessful. The order, soon after its foundation, contained from 24,000 to 30,000 members, and increased so rapidly, that it spread through all Italy. In 1820, in the month of March alone, about 650,000 new members are said to have been admitted; whole cities joined it. The clergy and the military, in particular, seem to have thronged for admission. The religious character of the order appears from its statutes: "Every Carbonaro has the natural and inalienable right to worship the Almighty according to the dictates of his conscience." After the suppression of the Neapolitan and Piedmontese revolution in 1821, the Carbonari throughout Italy were declared guilty of high treason, and punished by the laws. Meantime societies of a similar kind had been formed in France, with which the Italian Carbonari amalgamated, and Paris became the headquarters of Carbonarism. The organization took on more of a French character, and gradually alienated the sympathies of the Italian members, a number of whom dissolved connection with it, in order to form the party of Young Italy.

Car'bonates. See CARBON DIOXIDE.

Car'bondale, Pa., a city of Lackawanna County, situated on the Lackawanna River, 110 miles north-northwest of Philadelphia; and on the Erie, the Delaware & H., and the New York, O. & W. R.R.'s. It is the centre of an important anthracite coal-field, and the principal industry is mining. There are also machine-shops, foundries, etc. As it is in a monuntain region with fine scenery, it is also a summer resort. Pop. (1900) 13,536.

Carbonear, kär'bŏn-ēr, Newfoundland, a port of entry on the eastern side of the peninsula separating Trinity Bay from Conception Bay 25 miles in a northwesterly direction from St. John's. Pop. (1901) 3,703.

Carbonic Acid, or **Carbonic Acid Gas.** See CARBON DIOXIDE.

Carbonic Anhydrid. See CARBONIC DIOXIDE.

Carbonic Oxide. See CARBON MONOXIDE.

Carboniferous Limestone, or **Mountain Limestone,** certain limestones of Lower Carboniferous age, as named by Murchison and other English geologists. In the United States the silver-lead ores of Leadville and other Rocky Mountain camps, and the zinc and lead ores of southwestern Missouri, are in limestones of Carboniferous age. See CARBONIFEROUS SYSTEM.

Carboniferous Period, the last of the great time divisions of the Palæozoic Epoch. During it were laid down vast beds of plant-remains now turned to coal, whence the name. It is true that coal fields of later age than Carboniferous are known, particularly in North America, but the important coal fields of Europe and of eastern North America are of Carboniferous age. In North America, when the

Carboniferous Period began, most of New England, eastern Canada, and Newfoundland was land, though two long, narrow arms of the Gulf of St. Lawrence extended to Narragansett Bay. West of the Blue Ridge Mountains, or Appalachian uplift, was a great interior sea, in places quite deep and extending to the Rocky Mountains. During Carboniferous time, by a gradual uplift, the northeastern part of this sea was divided into two bays, one covering nearly all of Pennsylvania, West Virginia, eastern Ohio, and Kentucky, the other covering southern Michigan. In the west the old land surfaces sank, and great areas along the whole Rocky Mountain region and beyond were covered by the sea. In general, the Carboniferous in North America was a period of slow changes of land surface with no volcanic outbursts. In the eastern part of the continent the land sank, then gently rose, over great areas, forming vast swamps, with numerous oscillations following. The sea covered most of the land west of the Mississippi. In Europe a clear sea stretched from inland to central Germany at the beginning of Carboniferous time, but later this area was a series of swamps. In Russia the land, after several changes of level, sank, and a great area, comprising southern Europe and Asia and part of northern Africa, was covered by the sea.

The plant-life of the Carboniferous Period — entirely gymnosperms and angiosperms — showed some advances from the Devonian. The ferns were most abundant, some being like tall trees, others as small as the maidenhair fern of to-day. The most conspicuous growths in the Carboniferous forests were the Lycopods or club-mosses, now represented by insignificant forms, but then growing sometimes 75 feet or more high, with trunks three feet in diameter, and spreading branches (*Lepidodendron*). Other Lycopods (*Sigillaria*) had short, thick trunks with few if any branches. Still another group of cryptogams, the *Equisetæ* or horse-tail rushes, were of far greater importance in Carboniferous time than now. Of these the *calamites,* with their tall, slender stems, must have been one of the commonest plant forms of the Carboniferous forest. No plants with conspicuous flowers existed, the flowering plants being gymnosperms of which one of the commonest was *Cordaites.* The Carboniferous forests were probably gloomy and featureless. The singularity of the flora over the whole world from Siam to Spitzbergen indicates a uniform climate without temperature zones.

Of animal life, corals, especially the genus *Lithostrotion,* were abundant; and the *Foraminifera,* especially the genus *Fusulina,* became of importance. Of the echinoderms the extinct blastoids, particularly the genus *Pentremites,* were abundant, and the Carboniferous is the period in which the crinoids, or sea-lilies, reached their highest development. Sea-urchins (echinoids) were more plentiful than in the Devonian, but the trilobites were slowly dying out. Of the land arthropods, scorpions were fairly abundant, and the first true spiders appeared. The brachiopods were less abundant than in the Devonian, the genus *Productus* being of most importance. Bivalve mollusks were numerous, among them being the first land shell. Of the fishes, the sharks, notably the orders *Pleuracanthus* and *Acanthodes,* were remarkably developed. Amphibians, which probably existed in Devonian, increased greatly in Carboniferous time, but belonged to an order now extinct, *Stegocephala,* and were of small or moderate size, no species being over eight feet long.

Carboniferous System. As the rocks laid down in Carboniferous time furnish by far the greater part of the world's supply of coal, they have been very carefully studied in many different places and accurately mapped, so that more is known of the Carboniferous rocks than those of any other Palæozoic system. By American geologists the rocks are divided into two series, an upper and a lower, which differ greatly in Nova Scotia, the Appalachian States, the Mississippi valley, and the Rocky Mountain States.

The Lower Carboniferous series, in what is called the Acadian province, Nova Scotia, and New Brunswick, is made up of thick beds of sandstone and limestone overlaid by limestones containing masses of gypsum. The total thickness of the series is 6,000 feet. In Pennsylvania the Lower Carboniferous series is divided into the Pocono sandstone and the Mauch Chunk shales, with a total maximum thickness of 4,000 feet. Westward there are in Ohio the Waverly beds, shales with some limestone, and in Michigan the marshall beds, sandstone and gritty shales, with limestone and gypsum above. Farther west the Lower Carboniferous is represented by the Mississippian series, including the Kinderhook, Osage, St. Louis, and Chester stages, all limestones, with a maximum thickness of over 1,200 feet in southern Illinois. These limestones underlie the eastern and western interior coal fields (see COAL). In southwestern Virginia are limestones, sandstones, and shales of Lower Carboniferous age, 2,000 feet thick, and containing a few workable beds of coal. In the Rocky Mountains the Lower Carboniferous rocks are, with few exceptions, limestones.

The rocks of the Upper Carboniferous include the great coal fields of eastern North America. (For the origin of coal fields, see COAL.) The rocks of the coal measures are sandstones or conglomerates, grits, shales, clays, limestones, and seams of coal. A coal seam is usually underlaid by a bed of fire-clay, representing an old soil, and overlaid by shale. The total thickness of the Nova Scotia coal measures is 7,000 feet, and 76 distinct seams of coal are known. In Pennsylvania the coal measures have been separated into the millstone grit, lower productive, lower barren, and upper productive stages, and have a total thickness of 4,000 feet. In Michigan the coal measures are about 300 feet thick; in the eastern interior (Illinois-Indiana) field 600 to 1,000 feet, and in the western interior field the thickness varies widely, reaching a maximum in Arkansas.

The Upper Carboniferous rocks cover wide areas in Utah, Colorado, and Arizona; they also occur in the Black Hills in South Dakota, and in California, and British Columbia. They are generally limestones or sandstones, and contain no coal beds. The distinction between Upper and Lower Carboniferous is not as sharp as in the Mississippi valley. The total thickness of the whole Carboniferous series in Nevada and Utah is about 13,000 feet.

In western Europe the Lower Carboniferous limestones reach from Ireland to central Germany, with a maximum thickness in England of 6,000 feet. In southeastern Germany the Lower

Carboniferous rocks are sandstones and slates, while in Russia the coal measures of Lower Carboniferous age are overlaid by a great thickness of Upper Carboniferous limestone. In Asia the Chinese coal measures are of Upper Carboniferous age, and are underlaid by Lower Carboniferous limestone. In South America the Lower Carboniferous is mostly made up of sandstones, and the Upper of limestones, with very few coal seams.

See Dana, 'Manual of Geology'; Giekie, 'Text Book of Geology'; 'Report of the United States Geological Survey' (1900–01, Part III.).

Carborun'dum, a trade name for carbide of silicon, SiC. This compound is produced by melting sand and carbon together in the electric furnace. It is characterized by extreme hardness, and is used for abrasive purposes, as a substitute for corundum and emery. It was discovered by E. S. Acheson in 1890, and is now manufactured in large quantities at Niagara Falls. The production is probably about 1,500 tons per annum.

A new and valuable use for carborundum is covering firebrick with a highly refractory coating. Since carborundum can only be melted at extremely high temperatures, the electric furnace being required for the purpose, it follows that the temperatures ordinarily generated for smelting of ores and metals are much below its fusing point. Finely powdered carborundum is made up into a paste with sodium silicate, or some similar binding substance; and the paste is applied by means of a brush, or otherwise, to the bricks which are intended to be used for building a furnace, or those bricks are actually immersed in the viscid liquid for a certain time. If the furnace has already been built, the paste can be painted on the exposed surfaces. It is stated that a layer one twelfth inch thick will protect the bricks from the attack of the highest temperature which is ever produced by combustion methods in ordinary work.

Car'boy, a large and somewhat globular glass bottle protected by an outside covering of wickerwork or other material, for carrying vitriol or other corrosive liquids.

Car Building Industry. The memory of men still living is sufficiently elastic to stretch back to the beginnings of steam railroads in this country, and to comprehend the various changes by which the modern railway has become a highly organized and elaborately equipped mechanism. We borrowed the railway from England, but developed it on our own lines. The invention of the locomotive at first simply furnished a mechanical power to transport freight in cars that had formerly been hauled by horses. Tramways were in use in the Hungarian mines during the 16th century; and Ralph Allen's English stone-car of 1734, with its flanged wheels and its hand-brake, is clearly the forerunner of the freight-cars of to-day.

The term «railway» was invented in 1775, when it was first used in Smeaton's reports on English transportation, a quarter of a century before steam was applied to locomotion. Thanks to the recent researches of Mr. Clement E. Stretton, we now know that the first persons ever conveyed by a locomotive on rails traveled, on 24 Feb. 1804, behind Trevethick's locomotive on the Pennydarran cast-iron plateway or tramroad to Merthyr-Tydvil, in Wales, a distance of nine miles. In order to transport long bars of iron and timber, the cars were made in pairs, coupled together by an iron drawbar having a joint at either end. The cars had no sides, but in the middle of each was fixed a centre-pin upon which worked a cross-beam or bolster, and upon this cross-beam the timber or bars of iron were placed. On the occasion referred to the trucks were loaded with 10 tons of iron bars, and 70 persons stood on the iron. Here we have the origin of the bogie or truck, the invention of which has been claimed for this country, as we shall see hereafter. Also the capacity of the freight-car, fixed at the beginning at 10 tons, remained at that figure for half a century or more.

In 1812 John Blenkinsop of Leeds had a private car built to carry himself and his managers to his Middleton colliery, while the workmen rode on the coal-cars. On 27 July 1814, George Stephenson's first locomotive, Blucher, drew over the Kenilworth colliery line a passenger-car made by placing the body of Lord Ravensworth's four-in-hand coach on a wooden frame fitted with flanged wheels. This car was used for 20 years. On 27 Sept. 1825, the Stockton & Darlington Railway was opened, and trains of coal-cars were run, with one passenger-coach named the Experiment. This was the first passenger-car to be run regularly for the use of the public. It was placed on four wheels, and had a door at each end, with a row of seats along either side and a long deal table in the centre. This car was operated 10 days, until the novelty was worn off; and then the faster stage-coaches carried the passengers. It was not until 15 Sept. 1830 that the Liverpool & Manchester Railway opened its line with a train carrying 600 passengers, and immediately thereafter began to run the first regular passenger-trains.

It is a striking fact in the history of car construction that the English invented both the truck and the long passenger-car with the door at each end; and that these forms, once invented, were almost immediately discarded in England, so that it was left for this country to reinvent them and to make them the distinguishing features of American car building as contrasted with English construction. Indeed, it has been with great reluctance that we have ceased to claim them as original discoveries.

The fact that passenger-trains, by displacing stages, threw out of use many of those vehicles, coupled with the other fact that the stage owners, submitting to the inevitable, often became railroad promoters, furnishes a reason why the early masters of transportation both used the stage-coach body as a matter of economy, and also built their new cars on the model in which the conveniences of travel had been most highly developed. The first passenger-coach used in Pennsylvania in 1832 was a stage-coach slightly enlarged. To be sure, the early prints show that in 1830 Peter Cooper's first locomotive hauled an open boat-shaped car from Baltimore to Ellicott's Mills, on the Baltimore & Ohio Railroad; but this model must have been adopted for economy's sake, because in 1833 that railroad placed in service the Ohio, a car, stage-coach in shape, with seats on top as well as inside.

As President Mendes Cohen well observed in his address before the American Society of

Civil Engineers in 1892, the first important modifications in car building were called forth by the speed developed in the locomotive. Naturally the wheels first demanded attention. The names of four men are connected with early wheel improvement. Mr. Knight improved the shape of the tread and flange; John Edgar and Ross Winans developed the chilled features; and Phineas Davis further improved and perfected the wheel by altering the disposition of the metal in the tread and the angle of the flange, and by introducing within the cast-iron wheel a wrought-iron ring of five eighths or three quarters of an inch round iron, both perfected the chill and added strength to the wheel. Mr. Winans' shops turned out thousands of these wheels for use not only in this country, but also in Germany and Switzerland. From 30,000 to 50,000 miles represented the capabilities of a Winans wheel.

With increased speed came the need for increased steadiness, and it occurred to Ross Winans that by adopting the device of the bogie, or swiveling truck used in the transportation of freight, he could build an easy-riding passenger-car. In 1833 Mr. Winans constructed three long houses on wheels, each capable of seating 60 passengers. Having patented his invention, he was confronted by the fact that the principle he had used was one that had been utilized frequently on tramways, and particularly on the famous Quincy granite railroad, built to transport stone for the Bunker Hill Monument. At the end of protracted litigation the courts annulled the patent.

We now know that prior to 1830 England had three bogie-engines at work; that in 1831 Stephenson's John Bull, built for the Camden & Amboy road, was made into a bogie after it reached this country — a fact made patent by the famous run of that engine from New York to Chicago in 1893; that Horatio Allen used a bogie-engine on the South Carolina Railroad in 1832, the same year in which the bogie-locomotive Experiment was built for the Mohawk & Hudson Railroad. Moreover, the bogie principle was patented in England in 1812. Yet, whatever may be the legal aspects of the case, it is certain that the American passenger-car of to-day originated with the three passenger-coaches built in Ross Winans' shops in 1833. England discarded the bogie principle for engines in 1830, and did not return to it until 1876; and that country to this day has not adopted the bogie for passenger- or freight-cars. In 1889, the Paris, Lyons & Mediterranean Railway adopted the bogie for certain passenger-cars; and in 1895 the Great Western Railway of England began to experiment with the bogie-truck. In America the Winans passenger-coach almost immediately supplanted everywhere the stage-coach form, which England still retains in a modified shape, excepting only on the Pullman cars, introduced into that country in 1874. With us not only the passenger-cars, but the baggage, mail, and freight-cars, all were placed on swiveling trucks.

That the early railroads of this country were designed to carry passengers rather than freight is to be seen by their reports. The Baltimore & Ohio road, from 1 Jan. 1831, to 1 October carried over its 13 miles of track 5,931 tons of freight and 81,905 passengers; and so late as 1839 the Camden & Amboy carried only 13,520 tons of merchandise as against 181,479 passengers. In fact, the railways as freight carriers could not compete with the canals, which in those days were the traffic routes. In 1831 the Tuscarora & Port Carbon Railroad could not meet canal rates by 39¼ cents per ton, the railway charges being 40 cents, plus a toll of 15 cents per ton, while the canal rates were 10¾ cents, plus 5 cents toll.

Mr. John Kirby, describing from memory the freight-car of 1848, says that it was the same square box it is to-day; its capacity was from six to ten tons; the roof was covered with cotton duck painted and sanded. The hot sun cracked this covering and let the water in on the freight, an annoyance common also to passenger-coaches of that day. Few freight-cars were used in New York State at that date, the Erie Canal being sufficient for summer freight. Wood was the universal fuel, so there was no coal transportation. Wooden brake-heads were used, and it required three men to turn the screw that pressed the wheels on and off the axles. The ripping of planks was done by hand, as was also the dressing up; and when one man had tools to grind, a fellow-workman turned the stone. Carpenters and car builders of six years' experience commanded $1.12½ a day wages.

Viewed from the standpoint of to-day, the passenger-car of the early 'fifties, built at a cost of about $2,000, was a combination of inconveniences. The cast-iron stove in the centre of the car broiled those who sat immediately around it, while the unfortunates one seat removed from its satanic glare shivered and froze. In summer the dust was intolerable, and, notwithstanding elaborate devices for ventilation, the dust problem did not begin to be solved before the appearance of the monitor roof in 1860. Hot-water heating and the abolition of the deadly car-stove came with the Pullmans.

In 1856 Captain (now Sir) Douglas Galton, of the Royal Engineers, was sent to America to investigate our railways. His report to the lords of the Privy Council for Trade gives a straightforward and unbiased account of his investigations. Perhaps there is extant no other report which so comprehensively discusses the railway situation in the United States about that date.

"The practice of constructing railways [in America] in a hasty and imperfect manner," says Capt. Galton, "has led to the adoption of a form of rolling stock capable of adapting itself to the inequalities of the road; it is also constructed on the principle of diminishing the useless weight carried in a train. The principle is that the body of the car is carried on two four-wheeled trucks, to which the body is attached by means of a pintle in the centre, the weight resting on small rollers at each side. The framing of the truck is supported on springs resting on the axles, and the pintle and rollers are fixed to a cross-beam, which is attached by springs to the main framing; so that between the body of the car and the axles are a double set of springs. India-rubber springs are in general use, but they often become hard; consequently sometimes steel springs are used, with great advantage. Any side movement which might result from the slight play allowed to the cross-beam is counteracted by springs placed between its ends and the framing. An iron hoop attached to the framing passes under

the axle on each side, so as to support the axle in case it should break."

The bearings Capt. Galton found not unlike those used in England, but the use of oil as a lubricator was novel. He was told that under favorable circumstances the oil in an axle-box needed to be renewed but once a month; but that it was difficult to obtain good oil. The wheels were of cast-iron, with chilled tires; they were from 30 to 36 inches in diameter, weighed rather more than 500 pounds, and were without spokes. When made by the best makers they would run from 60,000 to 80,000 miles before the tires were worn, and they cost from $14.50 to $17.00 each. The iron used in making wheels was of very superior quality; and so great was the practical skill required that but three firms in the United States could be relied on to furnish wheels of the first grade.

The most approved form of draw-bar was continuous under the car, and was attached to the elliptic springs, acting in both directions. The iron shackle was in general use, but some railways preferred an oak shackle 18 inches long, two inches thick, and six inches broad. This block was bound with an iron band divided on each side at the centre, so that a car on leaving the rails would break the shackle transversely.

Already the automatic coupler for freight-cars was prefigured in a device by which the pin in the bumper of one of the cars was supported by means of a ball, so that the shackle of the on-coming car pushed back this ball and let the pin fall into its place. All passenger-cars and most freight-cars were supplied with brakes; and the Philadelphia & Reading Railroad was endeavoring to anticipate the day of train-brakes by an invention whereby a sudden check in the speed of the engine applied the brakes to the wheels of all the cars. The saloon, the car-stove, and the ice-water tank all had established themselves in the best cars, and were novelties to the visiting Englishman.

On the Illinois Central, between Cairo and Dubuque, some of the cars were filled with compartments in which the backs of seats turned up and so formed two tiers of berths or sofas, for the accommodation of persons who might wish to lie down and were willing to pay for the privilege. The passenger-car had attained a length of 60 feet, though the 30- and 45-foot cars were more common; the baggage-cars, with their compartments for mail and express, were 30 feet long, and the freight-cars from 28 to 30 feet. In those days the freight-cars were constructed more strongly than were the passenger-coaches; a Baltimore & Ohio freight-car 28 feet long, and with a capacity of nine tons, itself weighed six tons.

In summing up the result of his observations as to the rolling stock in this country, Capt. Galton notes that the Americans appear to have taken their ideas more from a ship than from an ordinary carriage, and to have adopted the form best calculated to accommodate large masses, with a minimum of outlay for first cost; and that while the cars had been designed with a view to avoid every appearance of privilege or exclusiveness, or of superiority of one traveler over another, they had been constructed so as to secure to every traveler substantial comfort and even privacy.

"There is but one class," he said; "but as the cars are designed with more regard to comfort than English railway carriages, this class is much superior to our second and third classes, and is inferior only to the best first-class English carriages. Notwithstanding the superior comfort of the American railways, the rates of fare averaged lower than the second- and sometimes even the third-class fares in England."

Of necessity progress in car-building had to wait for the development of the railroads. The original roads were not constructed as through lines between the larger cities, but as the connecting-links between natural waterways, answering to the portages or carrying places of the old days when commerce was conducted in canoes. Often built as the result of local or State enterprise, a short line was sufficient to use up the scanty capital available, or to exhaust the willingness of the people to be taxed for public improvements. The great systems of to-day represent survivals of the fittest early ventures, and development according to environment. Thus the various small roads which traversed the present main line of the New York Central were not consolidated until 1853, and the same year the roads between Philadelphia and Pittsburg came under one control. So late as 1862 there were five separate companies operating the lines between Lake Erie and Lake Michigan; and as each road had a gauge of its own, it was regarded as a triumph in car construction when freight-cars of compromise gauge were built to run over all five roads. In 1869, however, the Lake Shore & Michigan Southern lines came under a single head.

When, in October 1865, a combination was formed among eight railroads to establish a fast freight line between New York and Boston and Chicago, the maximum difference in the gauges of the several lines was one inch; and this was compensated for by a broad tread wheel. Each company contributed a number of cars proportionate to its mileage, one car for every three (afterward increased to one for every two) miles. In 1865 the quota of the Lake Shore & Northern Indiana was 179 cars; while in 1894 that road's quota of Red Line cars was 2,200.

In 1862 the United States government conducted the greatest railroad business known up to that time. With headquarters at Nashville, the government operated 1,500 miles of road with 18,000 men, whose monthly wages amounted to $2,200,000. The rolling stock consisted of 271 engines and 3,000 cars. No entirely new locomotives were built, but the 3,000 men employed in the locomotive repair shops pieced out fully equipped engines founded on a serviceable boiler or a pair of sound driving-wheels. Among the triumphs of the national car-shops were, first, a headquarters car for Gen. Thomas, the car being 50 feet long, iron-plated, and provided with a kitchen, a dining-room, a sleeping apartment, and an office; and, secondly, the hospital-trains, in which the jars and jolts were reduced to a minimum. It was during the year 1864 that Gen. McCallum and Col. Wyman came to Detroit and summoned the managers of the Michigan Car Company to stop all building then in progress and to work solely for the government. They gave a contract for a number of box- and flat-cars to be operated

on southern roads; and inasmuch as the gauge differed from that of the northern roads, the new cars were loaded on flat-cars and sent to Cincinnati. The government officials fixed the price of the cars and made payment in certificates, some of which the company exchanged for materials, and the remainder were held until money could be obtained for them.

The enormous transportation business developed by the war, together with the labor conditions and the paper-money issues, combined to raise the price of cars; so that the standard freight-car of 1864, a car 28 feet long and with a capacity of 10 tons, cost $1,000 or more. About 30 years later a car 34 feet long, with a capacity of 30 tons, and provided with automatic couplers, air-brakes, and other improvements, could be purchased for about $500.

When the war ended the managers of railways were called on to face a heavy decline in both freight and passenger traffic, due to the disbanding of the armies. Money was not plentiful, cars were very expensive, and the mania for extending lines into new territory had begun. Under these conditions the roads began a system of borrowing cars from the builders or from car-trust companies. The Michigan Car Company was probably the first to make contracts on a car-loaning basis; be that as it may, this company had at one time loaned to railroads between 6,000 and 7,000 cars, payment being made according to the car's mileage. With better times and better credit the roads began to buy cars for cash or on long time, as was most convenient; and loaning freight-cars to railroads on a mileage basis was practically discontinued. A majority of the refrigerator-cars, however, continued to be owned by private parties and run on a mileage basis. The reduction in the mileage rate practically killed the business of private ownership, since the new rate did not much more than pay for the repairs.

The sleeping-car had its beginnings as early as 1838. The Baltimore *Chronicle* for 31 October of that year described one such car that had been put on the line between Baltimore and Philadelphia. The enthusiastic reporter related that the car had berths for 24 persons, and that for a small consideration the weary passenger might spend the six hours of travel between those cities as pleasantly as if he were asleep in his own bed. Nothing then seemed to be wanting except dining-cars, and those were promised for the near future — a promise, alas! not fulfilled for many a long year.

Twenty years later, in 1858, George B. Gates invested $5,000 in two sleeping-cars to run between Cleveland and Buffalo; but passengers could not be persuaded to use them. The same year the line between Toledo and Chicago was equipped with two sleeping-cars built by the Wason Company, of Springfield, Mass., and owned by Mr. Bates, of Utica, N. Y. These cars were 50 feet long, with 16 sections in summer and 14 in winter. When not in use the bedding and curtains were stored in an end section; and a single wash-basin and one saloon furnished the toilet conveniences for the 48 persons the car was expected to carry. A sofa along the side of the car formed the lower berth, the middle one was hinged to the window-casing, and the upper berth rested on cleats fastened to permanent cross-partitions. It was while traveling in one of these cars, in 1858, that Mr. George M. Pullman began to plan the sleeping-cars that have revolutionized railway travel in this country, and are making their way in Europe, where comfort is less an essential to the traveler than it is in America.

In 1859 Mr. Pullman transformed two Chicago & Alton coaches into better sleeping-cars than any others; but it was not until 1863 that the Pioneer, the first Pullman, was placed on the road. The car cost $18,000 — an astounding price in those days. It was higher and wider than most roads could admit, and it was not until President Lincoln's funeral that the roads between Chicago and Springfield narrowed their platforms and adapted their bridges so as to allow the Pioneer, carrying the funeral party, to pass over their lines. Shortly afterward Gen. Grant's trip from Detroit to Galena, Ill., in the same car, opened those lines to the Pioneer. After that time progress was rapid. The Pullman Company was organized in 1867, and its success is too well known to need comment here. From the palace sleeping-car to the parlor- and the dining-room car is a short step. But a long jump was taken in the vestibule, invented by Mr. Pullman in 1887, by which trains are made solid and the platform is robbed of the last of its terrors.

In the winter of 1868-9 the first Westinghouse air-brake was used on the Steubenvillle accommodation train running on the Pittsburg, Cincinnati & St. Louis Railroad. The Pennsylvania road adopted it, and since the automatic feature was added, in 1873, it has come into almost universal use on passenger-trains, while by far the larger proportion of new freight-cars built are equipped with it. In 1887 a train of 50 freight-cars made a triumphal tour of the great lines, and by repeated tests, under varying conditions, proved that the Westinghouse brake can stop a train in one tenth the space required by the hand-brake. In 1867 Col. Miller placed his patent platform, buffer, and coupler on three cars building in the shops at Adrian, Mich.; and with great rapidity the dangerous old platform, with its loose link coupling, disappeared. In 1860 the Post-Office Department began to demand more room from the railroad companies, and year by year the mail-cars were increased from 17 to 20 feet in length, then to 35, and finally to 60 feet.

The interchange of cars among the various roads made it necessary to adopt standards in car construction, in order to facilitate repairs to cars when away from the home road. Some authority, too, was needed to settle disputes between roads, arising from charges for repairs; to investigate new brakes and couplers; and, in general, to keep the work of construction fully abreast of the times. The Master Car Builders' Association, organized in 1867, amply fills this need; and the reports of its annual meetings contain the latest word on all subjects relating to car-building. Its arbitration committee also acts as a court of conciliation for the various roads.

Prior to the panic of 1873 all the car-works were busy. That panic caused the failure of a large number of new railroads, which, in turn, forced into bankruptcy and eventual reorganization many car companies. From 1873 to 1879 the car-shops throughout the country were practically idle; but with the revival of business in

1878–9 the car-works again became busy, and with the exception of a slight dullness in 1883–4, did a large and profitable business until 1893. The effect of business depression on car-building may easily be seen from the fact that in 1890, 103,000 freight-cars were built by 50 companies; in 1893 the output of 43 companies was only 51,216 cars; and in 1894 the 27 companies operating their plants turned out 17,029 cars. Fifteen companies that built 3,000 freight- and 300 passenger-cars in 1893 built not a single car in 1894. The increase in the total number of cars during the fiscal year 1894 was but 4,132, as against 58,854 in 1893. The rapid increase since that date may be judged from the fact that the capacity of car-building factories in the United States on 1 June 1903 was estimated as follows: Freight-cars, 270,200 per annum; passenger-cars, 2,700; street-cars (including electric and interurban), 17,850.

CAPACITY OF CAR FACTORIES FOR OUTPUT JUNE 1, 1903.

	Freight cars	Passenger cars

The average life of a freight-car being from 12 to 15 years, at least 125,000 cars must be built each year to repair the ravages of time; besides the cars required to make good the losses by accidents and for the increase in mileage and business. The transportation of various kinds of products, such as live-stock, dressed meat, oil, timber, etc., has called into being cars especially adapted to each class of freight, so that scores of different kinds are now constructed to answer the demands of the shippers. Among the different makes may be named: flat or platform cars; the ordinary box-car, the gondola or coal-car, the hopper gondola coal-car, which has a gate in the bottom of the car for emptying the car without handling the contents; the hopper-car, which has a number of gates in the bottom for emptying the car rapidly; side dumping-cars, coke-cars, stock-cars especially prepared for different kinds of stock; horse express-cars, for transporting fine horses; furniture or vehicle-cars; refrigerator-cars; ventilated fruit-cars; special construction or repair-cars, and caboose-cars for trainmen. Steel-cars are used for the transportation of heavy material such as coal and ore. See STEEL CAR INDUSTRY.

Passenger-cars are divided into the ordinary passenger-car, the combination cars for baggage, mail, express and passengers, each style being of different construction; chair-cars, parlor-cars, dining-cars, combination parlor and café-cars; library- and buffet-cars; private cars containing business office, sleeping apartments, dining-room, kitchen, and observation room; and sleeping-cars. Street-cars are divided into electric, cable, horse, and parlor-cars.

According to the census of 1900 there were 65 establishments turning out steam-cars (some of which also constructed street railway cars); and 1,296 car-shops belonging to the various steam railways, and engaged in the building as well as the repairing of cars, making a total of 1,361 establishments, with a capital of $207,904,125, employing 215,567 wage-earners and salaried officials, with wages and salaries aggregating $120,798,002. The materials used cost $171,281,760 and the value of products aggregated $308,748,457.

The 1,296 establishments operated by railroad companies, reported an invested capital of $119,580,273, or 57.5 per cent of the capital of the combined industry.

The 10 states leading in the construction and repair of steam railway cars in 1900 were: Pennsylvania, with a product of $62,326,081; Illinois, with $41,426,030; New York, with $21,423,201; Indiana, $19,248,999; Ohio, $16,917,554; Michigan, $14,253,707; Missouri, $14,246,889; Texas, $8,314,691; California, $7,553,626; and Kansas, $6,816,816. The aggregate value of the products for these States $212,527,594, or 68.8 per cent of the total value for the United States. The products for the first five States aggregated $161,341,865, or 52.3 per cent of the total value.

The constantly increasing traffic in this country rapidly absorbs the product of the car-shops, but there is also a foreign demand of considerable magnitude for American-built cars. This demand changes with the varying industrial conditions and commercial activity of the countries importing these products, as well as with the economic conditions existing in this country.

In 1890 and 1891 the value of exported cars exceeded the value in 1900. During the business depression which followed there was a marked decrease in the number of cars constructed, both for foreign and domestic use. The construction of freight-cars was the first to be affected. The number of passenger-cars constructed in this

country did not decrease materially until after the Columbian Exposition in 1893. The foreign demand and the exposition were potent factors in keeping many of the shops running during 1893. A year or two later the demand for freight-cars began to increase, and since 1897 the demand for both passenger- and freight-cars for foreign and domestic use has shown a constant growth. The exports for 1900, aggregating $2,558,323, exceeded the average yearly exports from 1880 to 1890 by $1,581,872; those from 1890 to 1900 by $756,484; and the average for 20 years by $1,169,178.

Among foreign countries importing American cars for steam railroads in 1900, Mexico led, purchasing to the amount of $714,329. Egypt followed with imports aggregating $401,151. The next six countries in the order of amounts expended are: France, $280,939; Brazil, $133,378; Great Britain and Ireland, $124,585; Argentina, $105,147; British Australasia, $50,754; Cuba, $79,723. No cars or parts of cars were exported to Asia or Africa in 1890, but in 1900 these exports to Asia were valued at $33,492 and to Africa at $405,895.

W. J. McBRIDE,
Vice-President American Car & Foundry Co.

Car'buncle, a very severe form of boil (q.v.). Also the lesion of malignant pustule, or anthrax (q.v.).

Carbuncle, a general term used to describe any red garnet when cut *en cabochon*. Pliny and other early writers apparently applied the name "carbunculus" indiscriminately to ruby, ruby spinel and garnet. The best usage at the present time confines it to the almandite garnet when cut *en cabochon*, that is, with a rounded convex surface. Usually such stones are hollowed out at the back and a piece of metal foil is inserted in order to lighten the otherwise too dense red color.

Carburet. See CARBIDE.

Carcagente, kär-kä-hän'tā, or **Carcaxente,** Spain, a town in the province Valencia, and 28 miles south by west of the town of that name, in a fertile and beautiful plain, on the right bank of the Jucar. The houses are well built and spacious, forming wide and clean streets. The principal square is large, lined with handsome dwellings and shops, and contains a spacious and elegant modern townhouse and prison. There are likewise a parish church, several chapels, two convents, a hospital, almshouse, cemetery, some primary schools, and an extensive palace of the Marquis of Calzada. In the environs are delightful promenades and gardens. It has a trade in grain, fruits, silk, woolen goods, and linen. Pop. 12,000.

Carcajou, kär'ka-joo, a French-Canadian name for the wolverine (q.v.), frequently misapplied to the wildcat and puma.

Carcanet, kär'ka nĕt, a jeweled necklace or chain, an ornament referred to by Shakespeare, and by Tennyson in 'The Last Tournament.'

Carcano, Giulio, joo'lē ō kär-kä'nō, Italian poet: b. Milan, 1812; d. 1884. He wrote a narrative poem, 'Ida Della Torre,' while a student at Pavia (1834). His next work, 'Angiola Maria' (1839), had extraordinary success; it is a deeply sympathetic story of Italian family life, and is regarded as the highest type of that class in Italian. In the same vein is the volume 'Simple Narratives' (1843). He wrote also 'Damiano, the Story of a Poor Family,' and other works. See Prina, 'Giulio Carcano' (1884).

Carcar, kär'kär, Philippines, a city on the northern coast of the island of Cebu, situated on the Bay of Carcar, 23 miles from the city of Cebu. It is near the head of the bay and on the road running along the eastern coast of the island. Pop. about 30,000.

Car'cass, in military language, an iron spherical case filled with combustible materials, which is discharged from a mortar, howitzer, or gun. It does not burst, but has three fuse-holes through which the flame rushes, firing everything within its influence. Carcasses are of considerable use in bombardments for setting fire to buildings, vessels lying in harbors, etc. They will continue to burn for 8 or 10 minutes, and are not even extinguished by water.

Carcassonne, kär-ka-sŏn', France, capital of the department of Aude, on both sides of the river Aude and on a branch of the Canal du Midi, 53 miles south of Toulouse. It consists of an old and a new town, which communicate by a bridge of 12 arches spanning the river. The old town is surrounded by a double wall, part of it so ancient as to be attributed to the Visigoths, and is defended by a castle. Its streets are narrow, dirty, and desolate, forming a striking contrast to those of the new town, which is regularly built, and has many handsome modern houses. The boulevards are finely planted. The chief manufacture is that of woolen cloth, which is exported chiefly to the Levant, the Barbary states, and South America. There is also trade in wine, grain, brandy, fruit, and leather. Pop. 31,000.

Carchar'odon, an extinct genus of sharks of the Tertiary Period, nearly related to the modern white "man-eater" shark, but of gigantic size. The flat, triangular, sharp-edged teeth found commonly in the marl-beds of the Atlantic coast, are sometimes six inches wide, indicating that the animal was not less than 60 feet in length.

Carchemish, kär'kĕm-ĭsh, an ancient city on the Euphrates, formerly thought to be the same as the Roman Circesium, but now is more generally located near Jerabis, a village on the west bank of the Euphrates. It was the northern capital of the Hittites; was once captured by Tiglath-Pileser I., and made to pay tribute by Asurnazirpal; but was not finally subdued by the Assyrians until taken in 717 B.C. by Sargon II., who deported the inhabitants and settled Assyrians in the city. In 608 B.C. it was captured by the Egyptian Pharaoh Necho. At this time Josiah, king of Judah, was killed (mentioned in 2 Chron. xxxv.); but the city was retaken by Nebuchadnezzar in 605.

Carcinoma. See TUMOR.

Card, Henry, English miscellaneous writer: b. Egham, Surrey, 1779; d. Great Malvery, 4 Aug. 1844. He was educated at Westminster School and Pembroke College, Oxford. In 1815 he was presented to the vicarage of Great Malvern, Worcestershire, and in 1832 to that of Darmington, Herefordshire. He was

elected a Fellow of the Royal Society, 2 March 1820, and also a Fellow of the Royal Society of Antiquaries and of the Royal Historical Society. He was a prolific writer and some of his published works are: 'The History of the Revolutions of Russia' (2d ed. 1804); 'Historical Outline of the Rise and Establishment of the Papal Power' (1804); 'Thoughts on Domestic or Private Education' (1807); 'The Reign of Charlemagne, Considered Chiefly with Reference to Religion, Laws, Literature, and Manners' (1807); 'Literary Recreations' (2d ed. 1811); 'Beauford, or a Picture of High Life,' a novel (2 vols. 1811), etc.

Card Index. See LIBRARY LABOR-SAVERS.

Cardamine, kär'dă-mīn, a genus of plants of the natural order *Cruciferæ*, containing about 60 species with a very wide distribution. They are herbaceous plants with usually pinnate leaves, white or lilac flowers of the usual cruciferous type, and the siliquose fruit which characterizes a section of the order. One of the best-known American species is the cuckoo-flower (*C. pratensis*), growing in wet places from Vermont to New Jersey, westward to Wisconsin, and northward. *C. hirsuta* is a common weed everywhere, varying in size, according to soil, from 6 to 18 inches in height. The leaves and flowers of this species form an agreeable salad. This species produces young plants from the leaves, all that is necessary being to place them on a moist grassy or mossy surface. These species were imported to this country from Europe. The indigenous American species are *C. rhomboidea,* spring cress, and *C. rotundifolia,* mountain water-cress, common throughout the eastern part of the United States. *C. amara,* the bitter-cress, is not unlike the water-cress, but may be readily distinguished by its dark-colored anthers.

Car'damom, the capsule and seed of several species of plants of the order *Zingiberaceæ*, perennial plants, growing in the East. The fruit is used as a stimulant and aromatic. Triangular capsules, from four to five lines in length, contain the seeds, which are of a brown color, a pleasant, aromatic smell, and a warm, pepper-like taste. The cardamoms known in the shops are produced by *Amomum angustifolium,* a Madagascar plant, *A. cardamomum,* a native of Sumatra, and other eastern islands. Those recognized in the United States pharmacopœia, called true or officinal cardamoms, and known in commerce as Malabar cardamoms, are the produce of *Elettaria* (*Alpinia*) *cardamomum,* a native of the mountains of Malabar and Canara.

The seeds of cardamom are widely employed in medicine as the basis of vehicles for carrying disagreeable drugs, and also as carminatives and digestants. The volatile oils of cardamom act like other volatile oils in stimulating peristalsis, thus expelling excess of intestinal gases, and they also increase the gastric and intestinal secretions.

Cardan, or Cardano, Girolamo, jē-rō'lä-mō kär dăn or kär-dä'nō, Italian philosopher, physician, and mathematician: b. Pavia, 24 Sept. 1501; d. Rome, 21 Sept. 1576. He was educated from his fourth year in the house of his father. At 20 he went to Pavia to complete his studies, and after two years began to explain Euclid. He was subsequently professor of mathematics and medicine in Milan (1534). His biographers differ with regard to his religious opinions, but he was lost in cabalistic dreams and paradoxes, and pretended to have a familiar demon from whom he received warnings, etc. All this excited the theologians against him, who even accused him of atheism, though the charge was without foundation. He believed so implicitly in astrology that he drew his own horoscope several times, and ascribed the falsehood of his predictions, not to the uncertainty of the art, but to his own ignorance. His two works, 'De Subtilitate Rerum,' and 'De Varietate Rerum,' contain the whole of his natural philosophy and metaphysics. Cardan wrote also on medicine, and his fame as a physician was very great. His highest claims to the gratitude of the learned rest on his mathematical discoveries. Cardan, it is said, was told that Tartaglia had discovered the solution of cubic equations, and obtained the secret from him by stratagem and under promise of silence, but published the method in 1545, in his 'Ars Magna.' The honor of giving his name to the invention has remained to him who first made it known, and it is still called the formula of Cardan. It is universally believed that Cardan discovered some new cases, which were not comprehended in the rule of Tartaglia; that he discovered the multiplicity of the roots of the higher equations, and finally the existence of negative roots, the use of which he did not, however, understand. All his works, to the number of more than 50, are contained in the standard edition of Sponius (Lyons 1663).

Card'board, a thick paper, or aggregation of paper or paper-stock, made by pasting several sheets of paper together and compressing the product between rollers. The finest cardboard, or Bristol board, such as is used for visiting-cards and in the arts, is so made of white paper only. It is known as three-, four-, six-, or eight-sheet board, according to the number of layers of paper. A cheaper grade of white cardboard is composed of coarse white paper for the inner layers, and a finer facing paper on the outside. Another variety of cardboard is that used by boxmakers, and is made from coarse brown paper glued and rolled, and faced with white or colored paper, or unfaced, according to the use to which it is to be put. A coarser grade yet is known as millboard. This is used by bookbinders for the covers of books, by boxmakers, and for other work in which strength is of more value than appearance. Fine qualities of millboard are also made to some extent. See PAPER AND PAPER-MAKING.

Cardenas, Bernardino, bĕr-nar-dē'nō kär'dā-näs, Peruvian ecclesiastic: b. Chuquisæa, about 1595; d. Santa Cruz de las Sierra, about 1667. Entering the order of Franciscans he became a missionary among the Indians, being made bishop of Paraguay in 1640. On account of differences with the Jesuits he was twice expelled from his diocese. When Osorio, the governor, died in 1649, Cardenas was elected to fill the vacant position and immediately expelled the Jesuits from Asuncion. He was then deposed, imprisoned and excommunicated, but restored in 1662, and in 1666 made bishop of Santa Cruz de la Sierra. He wrote a defense of his career entitled 'Manuel y relacion de las Cosas del Reyno del Peru.'

Cardenas, kär'dā näs, Cuba, a seaport in the northern part of the province of Matanzas, situated on Cardenas Bay. It is connected with Havana by rail, and has a large trade in sugar and molasses. On 11 May 1898 the Spanish shore batteries and gunboats at Cardenas attacked the United States vessels blockading the port, and in the engagement the United States torpedo-boat Winslow was disabled, and Ensign Worth Bagley (q.v.) and four sailors were killed.

Cárdenas y Rodriguez, José (hō-sā') **M. de,** Cuban poet and prose-writer: b. Matanzas, 1812; d. 1882. Many of his humorous sketches of Cuban life have been translated into French and published in the 'Revue des Deux Mondes.' Besides a good comedy, 'A Deaf Uncle,' he has written a collection of fables, some of which have been translated into English; and numerous poems.

Cárdenas y Rodriguez, ē rō drē'gāth, **Nicolas de,** nē'kō-lä dā, Cuban poet and novelist: b. Havana, 1814; d. 1868. His works comprise: 'Poetical Essays' (1836); 'Scenes from Life in Cuba' (1841); 'The Two Weddings,' a novel (1844); 'Diego de Velazquez,' a drama. He was also a regular contributor to periodicals.

Cardi, Lodovico, lō-dō-vē'kō kär'dē, surnamed Civoli, or Cigoli, Italian painter and architect: b. 1559; d. 1613. He studied painting under Allori and S. di Titi, and afterward formed his style on the works of Andrea del Sarto and Correggio, but more especially on the noble and spirited productions of Baroccio at Florence. His architectural works, in which he followed Michael Angelo, possess considerable merit. His most celebrated picture is 'The Lame Man Cured,' which is in St. Peter's at Rome. Sacchi considers it entitled to hold the first place among the pictures in Rome, after 'The Transfiguration' of Raphael, and the 'St. Jerome' of Domenichino. His 'Martyrdom of St. Stephen,' executed for the convent of Monte Domini, and his 'Tobias Entertaining the Angel,' now in the Hermitage at St. Petersburg, are also noble paintings.

Car'dia, the upper or cardiac orifice of the stomach, as distinguished from the intestinal opening or the pylorus.

Car'diac Medicines, medicines which act upon the heart. They may be roughly classified into those which stimulate the heart; heart tonics, which brace or tone the heart; and heart sedatives or depressants, which quiet or soothe the heart. To the first group belong ammonia, ether, camphor, and alcohol; to the second, digitalis, squills, lily of the valley, and strophanthus; and to the last, aconite. Several of these must be administered with great care.

Cardial'gia, an intense pain over the general heart region. It is usually due to stomach disturbance, heartburn, and is often accompanied by pains in the œsophagus. Heartburn is nearly always due to the presence of large amounts of gas, causing pressure. These gases usually accompany and cause an indigestion.

Car'diff, Wales (Welsh, *Caerdydd, Caerdyv,* the fortress or city on the Taff), a municipal and parliamentary borough and seaport, the capital of Glamorgan, and largest town of Wales, is situated on the Taff, 1½ miles from its mouth in the estuary of the Severn, 170 miles west of London. The castle, situated on the north side of the town, was begun by Iestyn ap Gwrgan, the last Welsh prince, in the year 1080, and finished by Robert Fitzhamon, a kinsman of William the Conqueror, in 1110. In 1648 Cardiff Castle was besieged by Cromwell, who bombarded it for three successive days. It is at present a residence of the Marquis of Bute. The town of Cardiff, as the outlet for the mineral fields of South Wales, has grown up with great rapidity. In tonnage entered and cleared it is the third port in the United Kingdom, and in coal exported is the first. Among the public buildings, besides the parish churches, are included several places of worship belonging to the Baptists, Methodists, Independents, Roman Catholics, etc., a university college (for South Wales and Monmouthshire), established 1883, town hall, market hall, custom-house, law courts, militia barracks, theatre, county jail, literary and scientific institution, free library, and museum; a number of national, British, parochial, and other schools; an infirmary, almshouses, dispensary, etc. In recent years the streets have been improved by the corporation, and a water-supply brought from the Brecknockshire Beacons. The docks are extensive and well constructed, and further improvements to the port, including a new dock, tidal harbor, and a low-water pier, have been carried out. The docks, which were constructed by the Marquis of Bute at a cost of nearly $20,000,000, cover an area of about 200 acres. Iron ship-building is carried on, and there are iron and other works on a large scale. In 1900 the number of ships cleared was 14,437, of 9,331,344 tons. The town (with Cowbridge and Llantrissant) returns one member to the House of Commons. Pop. (1850) 18,000; (1901) 164,420.

Car'diff Giant, the name given to a roughly carved statue of a man exhibited in various parts of the United States in 1870 as a "petrified man." It was originally carved in California from a block of gypsum and subsequently buried in Onondaga County, N. Y., near the village of Cardiff, and hence its name. It was alleged to have been accidentally discovered there in October 1869, and the general public, as well as some scientists, were at first deceived by its appearance. In very recent years the authors of the fraud confessed their share in the hoax.

Car'digan, James Thomas Brudenell, Earl of, English general: b. Hambleton, 16 Oct. 1797; d. 28 May 1868. He was educated at Christ Church, Oxford, and was gazetted 6 May 1824, as cornet in the 8th Royal Irish Hussars, under the courtesy title of Lord Brudenell. His family influence and wealth in England procured for him a rapid promotion, and in a few years he had attained the rank of major. Lord Brudenell was next, 3 Dec. 1830, made lieutenant-colonel of the 15th Hussars. He was a member of the House of Commons from the period of his coming of age in 1818, until 14 Aug. 1837, when on the death of his father, he became Earl of Cardigan. After his regiment returned from India Lord Cardigan got himself into difficulties with the officers, who, one by one, had to sell out until the feeling of the regiment broke into mutiny

in what was known as the "black bottle quarrel." This quarrel arose in 1840, while Lord Cardigan's regiment was stationed at Canterbury. One of his officers, Capt. Reynolds, having caused wine to be placed on the table in a "black bottle," Lord Cardigan accused him of degrading the mess to the level of a pot-house. This led to angry words: Capt. Reynolds was placed under arrest, demanded a court-martial, but this privilege was withheld from him, and, as the public thought, unjustly. The excitement created by this affair and by his subsequent misunderstanding with another officer also of the name of Reynolds, had hardly subsided, when he fought a duel with Capt. Harvey Tuckett because this officer had censured his conduct in the *Morning Chronicle*. Capt. Tuckett was wounded, and Lord Cardigan tried before the House of Lords, but, although acquitted, public opinion was against him. His reputation, however, as an accomplished cavalry officer, and the satisfaction which the Duke of Wellington expressed in 1848, with the efficiency of the 11th Hussars' Regiment, which was under Lord Cardigan's charge, led to his promotion. On the outbreak of the Crimean war Lord Cardigan was raised to the rank of major-general, and appointed brigadier in command of the light cavalry brigade. This brigade constituted the celebrated "Six Hundred," whose charge at Balaklava will long be remembered as one of the bravest yet wildest feats, perhaps, ever told of in the history of war. On that occasion (25 Oct. 1854), Lord Cardigan is said to have received from Lord Lucan, his brother-in-law, an order to capture certain guns from the Russians. A mile and a half had to be traversed, under fire, before the enemy could be met, and the Russian forces stood in formidable array in every direction. The enterprise seemed hopeless. Cardigan, however, led on the charge, and actually took the guns, his men cutting their way through the infantry support and through the cavalry, and then back again, under the play of the Russian batteries, but with fearfully diminished numbers, the survivors not exceeding 150. As the hero of this daring exploit, Lord Cardigan was received with great enthusiasm on his return to England, and appointed inspector-general of the cavalry. The charges, however, subsequently alleged by the Crimean commissioners, tended to reduce the high estimate placed upon his services.

Car'digan, Wales, a seaport town, municipal and formerly a parliamentary borough, capital of Cardiganshire, on both banks of the Teifi, about five miles from its mouth, and 200 miles west-northwest of London. The most noteworthy buildings are St. Mary's Church, upward of 200 years old; several dissenting chapels, all fine edifices; the shire hall, Cardigan county school, the national and board schools, etc. Cardigan Castle, famous in Welsh history, stands at the foot of an eminence near the bridge, two circular bastions only now remaining of it. Brick, tile, and pottery works are here, and two iron-foundries are employed chiefly in the manufacture of agricultural implements. The salmon fishery is extensively carried on in the neighborhood, and many of the male population are engaged in the mercantile navy. Pop. (1901) 3,511.

Car'diganshire, Wales, a maritime county, having Cardigan Bay on the west, and on the land side chiefly Carmarthen, Brecknock, Radnor, and Montgomery; area, 443,387 acres. The northern and eastern parts are mountainous, the southern and western districts more level. The soil in the vales is chiefly peat, capable of growing either grain or grass, by the application of lime; the higher grounds consist of a light sandy loam, and the mountains are composed chiefly of clay-slate. The agricultural produce is comparatively small. Cattle, sheep, and wool are the staple commodities. The chief crops are barley and oats, very little wheat being grown. The lead-mines still yield largely, and zinc is obtained in several places. The coast-line is long, and many of the male population are sailors and fishermen. The principal towns are Cardigan, the county capital, Aberystwith, Lampeter, Tregaron, and Aberaeron. There are few manufactures. Pop. (1901) 60,237.

Cardinal von Widdern, Georg, gā ōrg kär'dē näl fŏn vĭd'dĕrn, German military historian: b. Wollstein, 12 April 1841. He entered the army in 1859; was engaged in the war of 1866 and the Franco-Prussian war; and was professor at the military school at Neisse. He retired in 1890 and has since lived in Berlin. He wrote 'Der Rhein und die Rheinfeldzüge' (1869); 'Belgien, Nordfrankreich, der Niederhein und Holland als Kriegsfeld'; 'Die Russischen Kavallerie-divisionen und die Armeeoperationen in Balkanfeldzuge' (1878); 'Das 76 Armeekorps und die 7 Kavallerie-division wahrend ihner selbständigen Operationen in Moselfeldzug bli Metz' (1886); and a number of works on military tactics.

Cardinal-fish, a fish of the family *Cheilodipteridæ,* characterized by two dorsal fins, the anterior of which consists of from six to nine spines. The anal fin is short and has only two spines. The scales are large, and the color is often bright red, whence the name. They are especially abundant in the East Indian seas; but several species are found in America, one of which is known as "king of the mullets."

Cardinal Flower, the name commonly given to *Lobelia cardinalis,* because of its large, very showy, and intensely red flowers. It is a native of America, growing on the muddy banks of streams. Stems two to three feet high, the flowers in racemes. It admits of cultivation, and is much prized abroad, particularly in England.

Cardinal Grosbeak, or **Red-bird,** a large song-bird (*Cardinalis cardinalis*) of the finch family, very numerous in the southern United States. It is particularly distinguished for its loud, clear, sweet song, whose quality makes it popular as a cage-bird. It is a brilliantly red bird, with a vermilion head, its bill surrounded with a small band of glossy black, and having the long feathers of the crown erected into a conical crest. The female builds her nest, which is made of twigs, grasses, roots, etc., in bushes, and frequently breeds twice in a season, her bluish, brown-spotted eggs numbering about four. This bird is migratory only to a small degree, moving southward only along the northern limits of its range, and occasionally passing the winter in village gardens even in New England.

Cardinal Points, the four intersections of the horizon with the meridian and the prime vertical circle. They coincide with the four cardinal regions of the heavens, and are, of course, 90° distant from each other. The intermediate points are called collateral points. See COMPASS.

Cardinal Virtues, in morals, a name applied to those virtues to which all the rest are subordinate, or which comprehend all the others. The distribution of the virtues, which lies at the foundation of this notion, had its origin in the old Grecian philosophy, and the same number is found here as in the elements of nature. These principal virtues, as enumerated by Plato, are prudence, temperance, fortitude, and justice. The first three seem to relate to the duties of man toward himself, and to correspond with the triple division of the soul into the intellectual, the irrational (the seat of the sensual desires), and the seat of the affections. Justice either relates to our duties to others (God and men), or is the union of the three first virtues. This division appears to be peculiar to the old Pythagoreans. Aristotle divided them still farther. The Stoics, too, made the same division in their system of morals, and Cicero introduced it into his 'De Officiis.' Plotinus and many New Platonists divide the virtues into four classes — civil or political, philosophical or purifying, religious, and lastly, divine or pattern virtues: a division coinciding with the rest of his philosophical views. The influence of the ancient philosophers has made these cardinal virtues also a part of the Christian code. Some add to them the three "Christian virtues," faith, hope, and charity, and call the former philosophical. The imagination of artists has represented the cardinal virtues under sensible images. In modern times this division is regarded as useless in treating of ethics.

Cardinals, College of, an ecclesiastical body consisting of the highest dignitaries in the Roman Catholic Church. The name cardinal is applied to one of the principal advisers of the supreme pontiff as it is to the principal virtues or to the four points of the compass; etymologically cardinal is from *cardo,* linige, pivot, tenon, point around which anything turns. In the 11th century the term cardinal appears to have come into use to designate the "bishops collateral to the Pope," those whose sees are in the neighborhood of Rome, and to the clergy of the principal churches, parishes or *tituli* of the city; but probably *cardinalis* was at first said of a principal church rather than of its ministers. Nor was the term cardinal at first restricted to designation of churches and their clergy in Rome and its vicinity; for a long time, even down to 1585, date of the bull *Postquam* of Sixtus V., which forbade the application of the term to any but members of the sacred college, it was customary to call the ecclesiastics attached to mother-churches or to all cathedrals even, *cardinales.* The use of the word *cardo,* or its equivalent to express the relation of a bishop to his clergy and people, is very ancient: Saint Ignatius, bishop of Antioch (d. about 202), speaks of the bishop of a church as the pivot on which it turned. Till the issuance of the bull *Postquam* the title of cardinals was currently bestowed, but not by authority from the centre, upon the clergy of cathedral chapters in countries beyond the Alps, as those of the sees of Bourges, Metz, Cologne, Compostella, and other cities in Germany, Spain, and France; even in Italy the same usage was common; for it was with the name *Cardinalis* as with the name *Papa:* they both were originally applied to church dignitaries, to pastors, and church officers generally; later their application was restricted.

Ever since the reign of Nicolas II. the cardinals have possessed the privilege of electing the Pope. The decree of Pope Nicolas (1059) provides that on the death of the Pope the cardinal-bishops shall assemble in council and then the rest of the sacred college shall join them. In naming the Pope the college must take into account the choice of the clergy and people; only in case no Roman priest is found eligible in every way, shall the choice fall upon one that is not a Roman. In the 12th century the sacred college comprised seven cardinal-bishops of the "suburbicarian" churches, Ostia, Rufina, Porto, Albano, Tusculum, Sabina, and Palestrina; the cardinal-priests were 28, and were the rectors of as many churches in the city; there were 18 cardinal-deacons, of whom 14 belonged to the clerical staff of churches in the city, and 4 to the papal court or household. The members of the sacred college are yet styled by the titles of churches in the city, but are no longer in any sense ministers of those churches or parishes. And, like other church offices and church dignities the cardinalate became an object of ambition or of cupidity; popes bestowed the honor, princes and popes bestowed the dignity and the emoluments of episcopal and primatial sees, with the cardinalate annexed, upon minors and infants; thus, John de Medici was raised to the cardinalate at the age of 14 years, being already vested with a number of highest church dignities; and as late as 1740 a prince of the house of Bourbon was archbishop of Toledo and cardinal at the age of eight years.

According to the present constitution of the sacred college that body consists of 70 members — though very rarely indeed, if ever, are all the places filled. Of the 70 six are cardinal-bishops, and they are the ordinaries of sees in the neighborhood of Rome; 50 cardinal-priests, and 14 cardinal-deacons. In the year 1903, the cardinal-bishops numbered five, all Italians; the cardinal-priests 52, and of these four were Spaniards, seven were Frenchmen, one German, one Belgian, one Pole, one American, three British and Irish, two Austrians, two Hungarians, one Bohemian; the rest were Italians. There were eight cardinal-deacons, among them one German and one Spaniard; the rest were Italians.

The scarlet hat is distinctive of the cardinalitial dignity, and above the double cross in the arms of an archbishop who is a cardinal is the figure of the scarlet hat with its tasseled pendants. The gown of the cardinal is scarlet (*purpura,* commonly rendered purple, but our "purple" in the language of the ritual is violet *violaceus*). Hence "to receive the hat" means to be made a cardinal; and to aspire to the purple is to aim at the cardinalitial dignity. Etiquette requires that a cardinal be addressed as Eminence; in English usually "your eminence," and every cardinal is *eminentissimus.* A bishop or archbishop who is a cardinal, uses such a formula as the following in official instruments

(the example is taken from the approbation of a book by an archbishop of Mechlin or Malines in Belgium):

"Engelbert, by the divine mercy, cardinal-priest of the holy Roman Church, of the title of Saint Bartholomew in the Island, archbishop of Mechlin, primate of Belgium," etc.

Carding, the process which wool, cotton, flax, etc., are made to undergo previous to spinning, to lay the fibres all in one direction, and remove all foreign substances. The card formerly consisted of a number of iron teeth arranged in a piece of leather of various lengths, and the material was combed by hand. For many years this work has been done by machinery, the cards being fine, long teeth fixed on leather strips called card-clothing, which are arranged on a series of cylinders so placed that the material is carried from one to another, until removed by still another and much smaller cylinder called the doffer, from which it is stripped by a moving comb, and then by a series of rolls is delivered in the form of a ribbon into a can, when it is ready for the drawing-frame, on which it is prepared for spinning.

Car'dioid, a heart-shaped curve. It is produced by drawing a great number of chords from a single point of the circumference of a circle, prolonging each beyond the further crossing of the circumference to a distance equal to the diameter of the circle, and joining the free ends by a smooth curve. It is a special case of the limaçon, in which the extension of the chords is of any uniform length. The limaçon was invented by Pascal.

Carditis, kär-dī'tĭs, an inflammation of the heart. The word is not now used, since more definite terms are accessible to designate particular types of inflammation. Thus myocarditis is an inflammation of the heart muscle, endocarditis, of the lining membrane, the endocardium; pericarditis, of the external membrane, the pericardium.

Cardona, kär-dō'nä, Spain, a town in the province of Barcelona, on the right bank of the Cardoner, 50 miles north-northwest of Barcelona. It has a castle. In its vicinity is a hill of rock salt 500 feet high, which affords inexhaustible supplies of salt. Pop. (1887) 3,708.

Cardoon', a garden vegetable (*Cynara cardunculus*), of the natural order *Compositæ*. It so closely resembles the artichoke (*Cynara scolymus*) that some botanists consider the two species merely as horticultural varieties. The plant, which is a native of southern Europe, is a thistle-like, tender perennial which is cultivated as an annual. Seed is usually sown in spring in a hotbed; the young plants are transplanted to the rich soil of the garden about four feet apart each way, and kept cleanly cultivated until the leaves are nearly full grown, when the plant is tied up, covered with straw and earth, to blanch for two or more weeks. The thick leaf-stalks and the mid-ribs are the parts desired. In America the plant is not very popular except with the foreign population.

Cards, pieces of cardboard, oblong in shape, bearing certain figures and spots; specifically, playing-cards used in various games of chance and skill. Playing-cards are probably an invention of the East, and some assert that the Arabs or Saracens learned the use of cards from the gypsies and spread them in Europe. The course that card-playing took in its diffusion through Europe shows that it must have come from the East, for it was found in the eastern and southern countries before it was in the western. The historical traces of the use of cards are found earliest in Italy, then in Germany, France, and Spain. The first cards were painted, and the Italian cards of 1299 are found to have been so. The art of printing cards was discovered by the Germans between 1350 and 1360. The Germans have, moreover, made many changes in cards, both in the figures and the names. The lanzknechtsspiel, which is regarded as the first German game with cards, is a German invention. Of this game we find an imitation in France, in 1392, under the name of lansquenet, which continued to be played there till the time of Molière and Regnard, and perhaps still longer. The first certain trace of card-playing in France occurs in the year 1361, and Charles VI. is said to have amused himself with it during his sickness at the end of the 14th century. The modern figures are said to have been invented in France between 1430 and 1461. It has been said that cards were known in Spain as early as 1332; but what is certain is that card-playing must have become prevalent in the course of the century, seeing it was prohibited by the king of Castile, John I., in 1387. Mr. De la Rue, the most extensive manufacturer of cards in England, obtained in 1832 a patent for various improvements in manufacture. The figures on cards had been generally produced by the outlines first being printed from copper plates, and the colors then filled in by stencilling. Mr. De la Rue's process was to print them from colored types or blocks exactly in the same way as calico-printing, but all the colors being in oil.

As early as the 15th century an active trade in cards sprung up in German, and was chiefly carried on at Nuremberg, Augsburg, and Ulm, the demand from France, England, Italy, Spain, and other countries producing great prosperity among the manufacturers. In England the manufacture of cards flourished especially under Elizabeth. But no sooner had cards come to be generally used in Europe, than they were prohibited by several governments, partly from moral considerations, the first games being games of chance; partly from considerations of political economy, as in England, where the importation of foreign cards was considered injurious to the prosperity of home manufacturers. The prohibition, however, only tended to increase the taste for cards. In England, under Richard III. and Henry VII., card-playing grew in favor. The latter monarch was very fond of the game, and his daughter Margaret was found playing cards by James IV. of Scotland, when he came to woo her. The popularity which cards gradually obtained in England may be inferred from the fact that political pamphlets under the name of "Bloody Games of Cards," and kindred titles, appeared at the commencement of the civil war against Charles I. One of the most striking publications of this kind was one in 1660 on the royal game of ombre. Pepys, in his 'Diary,' under the date of 17 Feb. 1667, states that on Sabbath evenings he found "the Queene, the Duchesse of York,

and another or two, at cards, with the rooms full of ladies and great men.»

The modern pack of cards, used in most of the familiar games, is 52 in number, containing four suits; clubs and spades (black), and hearts and diamonds (red). Thirteen cards compose a suit, consisting of king, queen, knave or jack, and ten pip-cards ranging in number of spots from one (ace) to ten. The figures of the four suits are supposed to have been originally intended for symbolical representations of the four great classes of men, and the names attached to these figures in England arose from a misapprehension of the names originally assigned to them. Thus, by the hearts are meant the gens de chœur (cœur), the choir-men or ecclesiastics, and hence these are called copas, or chalices, by the Spaniards; whose word espada, sword, indicating the nobility and warriors of the state, has been corrupted into the English spade. The clubs were originally trèfles (trefoil leaves), and denoted the peasantry; while the citizens and merchants were marked by the diamonds (carreaux, square tiles). The word knave (German, knab, boy), was used, of course, in its older sense of servant, or attendant on the knights. The natural rank of the cards in each suit is, king highest, and so on down to ace lowest; but in many games this rank is varied, as in whist, where the ace is put highest of all, above the king; in écarté, where it is put between the knave and the ten; and in bézique, where it is made the highest, but where the ten is put between it and the king; in quadrille, the rank of some of the cards is variable in every hand. Sometimes the pack of cards is reduced to 32, by excluding the six, five, four, three, and two of each suit; it is then called a «piquet pack.» An immense variety of games may be placed with cards, some involving chance only, others combining chance and skill, the best furnishing intellectual amusement. There are round games, in which any number of persons may join, as poker, hearts, loo, etc.; games for four persons, as whist, in its different forms, and euchre; for two, as piquet, écarté, bézique, cribbage, and penuchle, closely resembling bézique, and at present much played in the United States; and there is one game, solitaire, played in many ways, at which a single person often finds both restful diversion and pleasant occupation for the mind.

Carducci, or **Carducho, Bartolommeo,** bär-tō-lōm-mā'ō kär-doo'chē or kär-doo'chō, Italian artist: b. Florence, 1560; d. Madrid, 1608. He studied in Rome as a pupil of Zuochero, and later went to Spain, where he was a favorite of Philip III. Among his best works are 'Descent from the Cross,' and the 'Adoration of the Magi.'

Carducci, kär-dö'chi, **Giosuè,** Italian poet and philologist: b. Valdicastello, Tuscany, 27 July 1836. He was made professor of Italian literature in the University of Bologna in 1861. He had previously written essays on the history of literature; and a small volume of lyrics, 'Rimes' (1857). But his poetical genius is better shown in 'Inno a Satana' (1863); and 'Odi Barbare'; 'Nuove odi Barbare'; and 'Terze odi Barbare.' His employment of original poetic forms in the 'Odi Barbare' series has aroused much literary discussion. In criticism Carducci has published 'Studii leterarii' (1875); 'Bozetti critici e discorsi letterarii' (1875). See Chiarini, 'I critici italiani e la metrica delle Odi Barbare' (1878).

Carducci, or **Carducho, Vincenzo,** vĭn-chĕnt'sō, Italian artist: b. Florence, 1568; d. Madrid, Spain, about 1638. He was a brother of the preceding and was patronized by both Philip III. and Philip IV. of Spain, where his most important works are to be found. He was the author of 'Dialogos de las excelencias de las pintura' (1633).

Carduus, kär'dū-ŭs, a genus of plants belonging to the natural order *Compositæ,* resembling the thistles, common along the Mediterranean. They are almost all troublesome weeds, though some of them are said to possess medical properties which make them useful in fevers. Among the more common of them are the arvensis (corn-thistle, way-thistle, or creeping-thistle), which has strong fleshy roots extending underground, and difficult of extirpation; and *C. lanceolatus* (spear-thistle), which, both from its size and rough feeding, is a great robber of the soil, but from being only a biennial is more easily managed.

Card'well, John Henry, English clergyman: b. Sheffield, England, 20 June 1842. He was educated at Caius College, Cambridge, was ordained in the Established Church 1865, and was incumbent of St. Andrew's, Fulham, 1868–91. Since 1891 he has been rector of St. Anne's, Soho, London, and has been prominent in municipal politics and civic reforms. He has published 'The Story of a Charity School'; 'Two Centuries of Soho'; 'Men and Women of Soho, Famous and Infamous.'

Care Sunday, sometimes taken to be the Sunday immediately preceding Good Friday; but generally used to signify the fifth Sunday in Lent. Same as Passion Sunday.

Careen'ing, the process of heaving a vessel down on one side by applying a strong purchase to the masts, so that the bottom may be cleansed by breaming, that is removing by means of fire any growth which adheres to it, or any other necessary work effected. A half careen may take place when it is not possible to come at the bottom of the whole ship. Very few ships are now careened, more especially since the introduction of copper sheathing.

Carême, Marie Antoine, mä-rē äṅ-twän kä räm, French cook: b. Paris, 8 June 1784; d. there, 12 Jan. 1833. He wrote 'Le pâtissier pittoresque' (2d ed. 1842); 'Le mâitre d'hotel française' (2d ed. 1842); 'Le pâtissier royal parisien' (1828); 'L'art de la Cuisine française aux XIX. siécle' (1833).

Caret, kărā', a turtle. See HAWKSBILL.

Carew, ka-roo', **Richard,** English antiquarian and poet: b. East Antony, Cornwall, 17 July 1555; d. there, 6 Nov. 1620. He was a member of the House of Commons, high sheriff of Cornwall in 1586, and the author of a much valued 'Survey of Cornwall' (1602), and an English translation of a portion of Tasso's 'Jerusalem Delivered.'

Carew, Thomas, English poet; b. 1598; d. 1639. He was educated at Corpus Christi College, Oxford. Cultivating polite literature in the midst of a life of affluence and gaiety, he was the subject of much eulogy by Ben Jonson,

Davenant, and other writers of the period. In him was exhibited the not unusual transformation of the courtly and libertine fine gentleman into the repentant devotee. Carew is coupled with Waller as one of the improvers of English versification. The first collection of his poems was printed in 1640, and the last in 1824. His elegant masque of 'Cœlum Britannicum' was printed both in the early edition and separately in 1651, and the whole were included in Chalmers' 'British Poets.' Carew was much studied by Pope, and Dr. Percy also assisted to restore him to a portion of the favor with which he has come to be regarded. Specimens both of the sublime and the pathetic may be found in his works; the former in his admirable masque, and the latter in his epitaph on Lady Mary Villiers.

Carex, kār'ĕks, a genus of plants, belonging to the natural order *Cyperaceæ,* or sedges, and containing numerous species, which are found in all parts of the world where vegetation can exist, on the driest upland as well as the wettest marsh. The plants are perennial, often creeping, with sharp-keeled leaves and solid triangular stems. The flowers are without perianth and unisexual, being grouped in spikelets. The male flowers have usually three stamens, the female having a single style with three stigmas. The number of known species is above 2,500, and of these the United States has nearly 300. Hardly any of them have any agricultural value, but *C. arenaria,* the sand-sedge, is of use in binding the sand on many sea-shores. In parts of the United States a poor quality of hay is made from some of the sedges. *C. japonica variegata* is an elegant variety cultivated by florists.

Ca'rey, Henry, English composer and poet: b. London, 1696; d. there, 1743. He is supposed to have been a natural son of George Saville, Marquis of Halifax. His first instructor in music was a German, named Linnert, but he was afterward more thoroughly trained under Roseingrave and Geminiani. He was inexhaustible in the invention of new, pleasing, and often deeply pathetic melodies, to which he not unfrequently furnished the words. His 'Sally in Our Alley' is still a well-known song. He has also been said to be the author of 'God Save the King,' but this appears to be doubtful. He supported himself by public and private teaching, but his whole life was a continued struggle with poverty, and it has been said that at last, in a fit of despair, he committed suicide (1743). His collected songs were published in 1740. Among other works are: 'Teraminta' (1732) and other operas; 'Chrononhotonthologos,' «the most tragical tragedy ever yet tragedized» (1734), a burlesque; 'The Wonder, or An Honest Yorkshireman' (1735); and 'The Dragon of Wantley' (1737). His dramatic works were published together in 1743.

Carey, Henry Charles, American political economist: b. Philadelphia, 15 Dec. 1793; d. there, 13 Oct. 1879. He was the eldest son of Mathew Carey, and in 1814 became a partner in his father's bookselling and publishing firm, where he continued until 1835. In that year he published an essay on 'The Rate of Wages,' which he afterward expanded into 'The Principles of Political Economy' (1837–40). His other important works are: 'The Credit System in France, Great Britain, and the United States' (1838); 'The Past, the Present, and the Future' (1848); 'The Principles of Social Science' (1858–9); 'Letters on Political Economy' (1860 and 1865); 'The Unity of Law' (1872). Originally a free-trader, he became an advocate of protection on the ground of temporary expediency; held that the growth of population was self-regulating; and was opposed to the theories of Ricardo and others on the law of diminished returns from the soil and on rent. He was also opposed to any arrangement on the subject of international copyright. Some of his works have been translated into other languages, and his writings have had considerable influence on economical speculation.

Carey, James F., American socialist leader: b. Haverhill, Mass., 19 Aug. 1867. He received a common school education and learned the shoemaking trade. In 1895 he was chairman of a convention at Boston, which amalgamated three national organizations of shoemakers into one union. In 1894 he was one of the leaders in the agitation of the unemployed on Boston Common, and the governor appointed him a commissioner of the unemployed, but he was not confirmed. He was later elected president of the Haverhill common council. In 1898, 1899, and 1900 he was elected to the Massachusetts House of Representatives, twice defeating a combination of the Democratic and Republican parties. He was the first Socialist ever elected to political office in New England.

Carey, Mathew, Irish writer and bookseller: b. Dublin, 28 Jan. 1760; d. Philadelphia, 16 Sept. 1839. After a varied experience, including imprisonment for offending publications, he came to the United States in 1784, and in Philadelphia began to publish the *Pennsylvania Herald.* A few years later he became a bookseller, and an extensive publisher. The best known of his political writings was his 'Olive Branch' (1814). It was an effort to promote harmony among political parties during the War of 1812. It passed through 10 editions. In 1819 he published his 'Irish Vindications,' and in 1822, 'Essays on Political Economy.'

Ca'rey, Rosa Nouchette, English novelist: b. London. She began writing novels in 1868, and her fictions, in which the literary element is not a very strong feature, have been very popular with the average, uncritical reader who demands only to be entertained and cares little or nothing for literary style. They include 'Wee Wifie' (1869); 'Nellie's Memories' (1868); 'Barbara Heathcote's Trial' (1871); 'Robert Ord's Atonement' (1873); 'Wooed and Married' (1875); 'Heriot's Choice' (1879); 'Queenie's Whim' (1881); 'Mary St. John' (1882); 'Not Like Other Girls' (1884); 'For Lilias' (1885); 'Uncle Max' (1887); 'Only the Governess' (1888); 'Basil Lyndhurst' (1889); 'Lover or Friend' (1890); 'Sir Godfrey's Grand-daughters' (1892); 'Men Must Work' (1892); 'The Old, Old Story' (1894); 'Mrs. Romney' (1894); 'The Mistress of Brae Farm' (1896); 'Other People's Lives' (1897); 'Mollie's Prince' (1898); 'Twelve Notable Good Women'; 'My Lady Frivol' (1899); 'Rue with a Difference'; 'Life's Trivial Round' (1900); 'Herb of Grace' (1901); 'The Highway of Fate' (1902).

Carey, William, English Orientalist and missionary: b. Paulerspury, Northamptonshire, 17 Aug. 1761; d. Serampore, India, 9 June 1834. He was early apprenticed to a shoemaker, and continued to work at his trade till he was 24. With what assistance he could procure he acquired Latin, Greek, and Hebrew, and studied theology. In 1786 he became pastor of a Baptist congregation at Moulton, and in 1787 was appointed to a similar situation in Leicester. In 1793 he sailed for the East Indies as a Baptist missionary, but became overseer of an indigo factory. He studied languages and natural history, and collected a rich store of Oriental knowledge. In 1800, in conjunction with Marshman, Ward, and others, he founded the missionary college at Serampore; the year following he became professor of Sanskrit, Bengali, and Mahratta at the newly erected Fort William College, Calcutta. In Serampore he had a printing-press for more than 40 different Indian languages, and issued various translations of the Scriptures. His first work was a Mahratta Grammar. It was followed by other works, including a Bengali 'Lexicon,' in which he was assisted by Felix Carey, his son. Under his direction the whole Bible was translated into 6, and the New Testament into 21 languages or dialects of Hindustan; and considerable progress was made with the translation of the whole Scriptures into Chinese. He also edited Shroeder's Lexicon of the Thibetan language, and Roxburgh's 'Flora Indica,' in which a genus of plants which he discovered is named after him, *Careya*. He established an agricultural society at Calcutta, and a botanical garden, at his own expense, at Serampore. See his 'Life' by Dr. G. Smith (1885).

Cargill, kär'gĭl, **Donald,** Scotch covenanting preacher: b. Rattray, Perthshire, about 1619; d. Edinburgh, 27 July 1681. He was educated at Aberdeen and St. Andrews, and became minister of the Barony Church in Glasgow in 1655. At the Restoration he refused to accept collation from the archbishop, and was exiled beyond the Tay. In 1679 he took part in the battle of Bothwell Bridge, where he was wounded, but succeeded in escaping to Holland. In 1680 he published, along with Richard Cameron, the 'Sanquhar Declaration.' In September of the same year he formally excommunicated King Charles II., Duke of York, and other great personages. After avoiding pursuit for several months, in May 1681, he was captured, and at Edinburgh tried and sentenced, and 27 July was beheaded.

Car'hart, Henry Smith, American scientist: b. Coeymans, N. Y., 27 March 1844. He was graduated at Wesleyan University in 1869, and since then has taught physics and chemistry. Since 1886 he has been professor of physics at the University of Michigan. He has written 'Primary Batteries'; 'University Physics'; 'Electrical Measurements'; and other books.

Carheil, Étienne de, ä-tē-ĕn dė kä-rä-ē, French Jesuit missionary in North America: d. after 1721. He labored for more than half a century among the Canadian Hurons and Iroquois, and was long stationed at Michilimachinac.

Ca'ria, in ancient geography, the country forming the southwest corner of Asia Minor, bounded on the north by Lydia or Mæonia, from which it was separated by the Mæander; on the east by Phrygia, on the southeast by Lycia, and on the south and west by the Mediterranean. Some confusion, however, exists in regard to its boundaries. Part of it was settled by Greek colonies of Ionians and Dorians, who dispossessed the original inhabitants. It was included in the dominions of Crœsus, king of Lydia, and on his overthrow by Cyrus was transferred to the Persian monarchy, under whose protection a dynasty of Carian princes was established. Halicarnassus was the residence of these sovereigns, among whom were the two celebrated queens, the first and second Artemisia. The progress of the Roman conquests ultimately extinguished the independence of Caria, and about 129 B.C. it was incorporated in the Roman province of Asia.

Cariaco, kä-rē-ä'kō, Venezuela, a seaport in the state of Bermudez, situated to the east of the Gulf of Cariaco, near the mouth of a river of the same name, adjoining a large plain, covered with plantations. Its trade is chiefly in cotton and sugar. The Gulf of Cariaco is 38 miles long, from 5 to 10 broad, from 80 to 100 fathoms deep, surrounded by lofty mountains. Pop. 7,000.

Cariacou, kăr'ĭ ă koo, the name given to American deer of the genus *Cariacus*, found in all parts of North America up to lat. 43° N. It is smaller than the common stag, and its color varies with the seasons from reddish-brown to slaty-blue.

Cariama, sä-rē-ä'mą, a bird (*Cariama cristata*), a native of Brazil and Paraguay, where its loud scream is a familiar sound on the campos, and where it is domesticated and trained to guard fowls. With an allied Argentine bird (*Chunga burmeisteri*) it constitutes a family (*Cariamidæ*) of great zoological interest, combining as it does characters of the bustards, caracara eagles, and cranes, with each of which it has been at times associated.

Carib, kăr'ĭb, a native American race which attained its highest development in the West Indies. Originating in the valley of the Orinoco, this race spread along the coasts, northward and southward, to a great distance, and especially from island to island of the Lesser and Greater Antilles and the Bahamas. At the time of the discovery of America its language was spoken, with dialectic variations, from the coast of Florida to lower Brazil,—wherever large canoes could carry the swarming, warlike tribes. The Caribs were the Vikings of South America. The race name survives in "Caribbean" Sea, "Caribbee" Islands, the word "cannibal," etc.; the race itself is still well represented at various points in South America. In the West Indies, however, the large native population disappeared rapidly after the Spanish conquest, Caribs and other tribes of the same stock (Arawaks, Lucayos, Boriqueños, etc.) either succumbing under the new conditions or losing their distinctive characteristics by blending with Europeans and Africans. Surviving groups of West Indian Caribs may be studied to-day in the island of Dominica. A few remained in Martinique and St. Vincent up to the time of the volcanic eruptions in 1902. Great Britain deported 5,000

Caribs from St. Vincent to the island of Ruatan in the Gulf of Honduras in 1796; thence they migrated to the Central American coast, where their numerous descendants have become a not inconsiderable element in the population of the mainland. In the 'Proceedings of the American Association for the Advancement of Science' (1902, Vol. LI.), Mr. J. Walter Fewkes of the Bureau of American Ethnology calls attention to the different characteristics which the Caribs displayed in different circumstances and localities. Thus the natives in the Bahamas, Cuba, Haiti, and Porto Rico were mild, agricultural people who had lost in vigor, while gaining a rudimentary knowledge of the arts of peace, by their sedentary life. On the other hand, constant incursions from the home of the race (the Orinoco region in Venezuela) kept alive the savage customs and ferocious spirit of the Caribs of the Lesser Antilles. Such incursions took place even after the date of the Spanish settlements. The houses of the more peaceful Carib communities did not differ greatly from those of the peasantry in the same regions at the present time. In lieu of clothing, Carib men and girls covered their bodies, as well as their faces, with paint, to protect them from the bites of insects and the heat of the sun. A woven cloth of palm fibre, called *nagua,*—a breech-cloth with long ends,—was worn by the chiefs and the married women. For purposes of decoration, and to distinguish members of one family or community from those of another, designs of animals and plants were painted on the body. Their social organization closely resembled that of the North American Indians, the unit of organization being the clan, ruled by a *cacique* (chief). Combinations were sometimes formed by a number of caciques for mutual defense, and extensive territories were subjected to the control of the more ambitious leaders. Among the insignia of the cacique's rank were the gold disk called *guarim,* worn on his breast, and a stone amulet tied to his forehead. His numerous wives were practically slaves. *Ex officio,* he was a member of the priesthood. Columbus at first received the impression that the Caribs lacked spiritual insight; longer sojourn among them, however, convinced him that they worshipped many supernatural beings whom they represented by idols, called *zemis;* they had temples for this purpose, in which rude idols were set up to be consulted as oracles by the priests. It is probable that belief in a future life, although not universally held, as some authorities assert, was generally taught by the priests; and it is quite certain that the latter possessed great influence, being physicians to the people as well as ministers to the *zemis.*

Like other savage races of the region from which they came, the Caribs were anthropophagi; yet the evil prominence given to them through the coining of the word *cannibal* (a Latinized form of *Carib*) is not wholly merited. The discoverers, finding a great number of human skulls in the Carib houses, jumped to the conclusion that each skull was the trophy of some revolting feast. In point of fact, the Caribs, being ancestor-worshippers, preserved these relics in honor of defunct members of their family.

MARRION WILCOX,
Authority on Latin-America.

Caribbean (kăr-ĭ-bē'ăn) **Sea,** a part of the Atlantic Ocean occupying a basin 750,000 square miles in area, bounded by South and Central America, and the Greater and Lesser Antilles. Its perimeter is wholly mountainous. Mountain folds (continued in submarine ridges from the Greater Antilles to Honduras) mark its limits on the north and south; but the volcanic chain of the Lesser Antilles rises on the east, and the volcanoes of Central America in the remote past formed a wall separating it from the Pacific on the west. Separating it from the Atlantic are steep submarine ridges, of which the Lesser Antilles are the summits. A portion of the broad equatorial stream, which flows from east to west, from the coast of Africa to that of Brazil, enters the Caribbean between the islands at the southern end of the Antillean chain: the waters of this sea, therefore, move from east to west and northwest, and seek an exit through the Yucatan Channel. But the latter is too small to allow an outflow equal to the inflow into the Caribbean; so that, after the trades have forced the equatorial water into the Caribbean basin, it must remain there a considerable length of time, thus becoming superheated, before it passes into the Gulf of Mexico, where, owing to similar differences between the rate of inflow and outflow, the water becomes still more superheated before passing through the Florida Straits as the Gulf Stream. The main westerly current in the Caribbean, after passing through the Banks Strait, between the Mosquito Reef and Jamaica, is joined by the current of the Windward Channel. The trade-winds, blowing with a steady velocity across the Caribbean region, from east to west, make the surface of this sea much rougher than that of the Gulf of Mexico; they mitigate the tropical heat at all points where their influence is felt; and the moisture they bring from the Atlantic is precipitated in the form of abundant rains against the eastern slopes of the mountains, both on the islands and the mainland. Hence the distinction between "windward" and "leeward" regions, insisted upon especially in the West Indies. The Gulf of Mexico, sheltered behind the Antilles and Yucatan, is practically a "leeward" expanse; but the summer climate of Texas and the great plains is somewhat modified by Caribbean trade-winds.

Recent studies of the Caribbean basin have disclosed its interesting submarine topography —"a configuration which, if it could be seen, would be as picturesque in relief as the Alps or Himalayas. Nowhere can such contrasts of relief be found within short distances. Some deeps vie in profundity with the altitudes of the near-by Andes. . . . Some of the depressions, like the Bartlett Deep, are narrow troughs, only a few miles in width, but hundreds of miles in length, three miles in depth, and bordered by steep precipices. . . . There are long ridges beneath the waters, which, if elevated, would stand up like islands of to-day. . . . Again, vast areas are underlain by shallow banks . . . often approaching the surface of the water, like that extending from Jamaica to Honduras. . . . The greater islands and the mainlands are bordered in places by submerged shelves." (From 'Cuba and Porto Rico': see authorities below.) All the islands are, then, to be regarded, from a physiographic point of view, as the "tops of a varied configura-

tion which has its greatest relief beneath the sea»; and some of these submarine valleys and mountains have yielded a surprising number of animal forms previously unknown. Dredgings in depths of over 2,000 fathoms have brought to light new species of crustacea, and forms resembling the fossils of past geological epochs are taken alive in those profound marine valleys. Many phosphorescent creatures are found; in certain places «dense forests of pentacrini undulate on the bottom like aquatic plants»; on the submerged banks and in the shallows, coral polyps and mollusks are employed as actively now as ever, in extracting the lime carried in solution by the sea-water, to build its shells and corals which are so large a part of the rock-making material in all this region, from Yucatan to Porto Rico. The most important marine highways for Caribbean commerce are those on the north: the Windward, Anegada, and Mona passages, and the Yucatan Channel. (For the origin of the name, see CARIBS.) Consult: Agassiz, 'The Gulf Stream' (in annual report Smithsonian Inst. to July 1891, Washington 1893); Hill, of United States Geological Survey, 'Cuba and Porto Rico' (1898).

MARRION WILCOX,
Authority on Latin-America.

Caribbee, kăr-ĭ-bē', or **St. Lucia Bark**, a bark sometimes substituted for cinchona (q.v.), though not containing its characteristic alkaloid. It is procured from the *Exostemma Caribæum*, a tree growing in the West Indies. This bark is in convex fragments, covered with a yellow epidermis, and has a very bitter taste and very faint smell.

Caribbee (kăr'ĭ bē) **Islands**, a name commonly given to that portion of the chain of Lesser Antilles between the Virgin and South American groups. See ANTILLES.

Caribe, any of a group of small, robust, voracious fishes, often of singular form, and allied in structure to salmon, which abound in South American tropical rivers. They have numerous teeth, well fitted to biting out pieces of flesh, and instantly seize upon any disabled or soft-bodied creature in the water, and devour it or worry it. Hook-and-line fishing is almost useless where these little bandits are numerous, as they rob the hooks of bait, or tear to pieces anything caught before it can be lifted out of their reach. They will even attack and badly wound human bathers. One of the best known and most dreaded is the piraya of the Amazon, which is said to come in crowds wherever blood is shed in the water. These fishes constitute the subfamily *Serrasalmoninæ*, of the family *Characinidæ*, and are intermediate between the cyprinoids and the salmonoids. A distinguishing characteristic is the fact that the abdomen is serrated with sharp spines.

Caribou, kă-rĭ-boo', the name of two species of reindeer found in Canada. One of these, *Rangifer grœnlandicus*, known as the barren ground caribou, inhabits the barren country in the north of British North America, extending also into Greenland. In color it is reddish-brown above and white below in summer, but the winter coat is whiter and denser. It migrates northward in summer, but on the approach of winter it travels south to the forest country. The other species, the woodland caribou (*R. caribou*), is larger, but has smaller and less branched horns. It inhabits the wooded country to the south of the places frequented by the above species. It is of a general dun-gray color, and the height at the shoulder is about three and a half feet. It is rather shy, and its fleetness enables it readily to distance those in pursuit. Its food consists mainly of lichens, but other vegetable products are also eaten.

Caribou, Maine, town in Aroostook County, 200 miles north of Bangor, on the Canadian P. R.R. It has two banks, a State fish hatchery, court-house, numerous churches and public schools. Its principal products are lumber, starch and potatoes. About 40 per cent of the population is French. Pop. (1900) 4,758.

Car'ica (from Caria, a district of Asia Minor, whence it was supposed to have come), a genus of plants, the typical one of the order of Papayads (*Papayaceæ*). It contains about 10 species, all natives of tropical America. They are small trees without branches, and with large, variously lobed leaves, resembling those of some kinds of palm. They exude an acrid, milky juice when wounded. The most remarkable species is the *C. papaya*, the Papaw-tree, a small tree, seldom above 20 feet high, with a stem about a foot in diameter, tapering gradually to the top, where it is about four or five inches. The fruit is of a dingy orange-yellow color, oblong, about 10 inches long by three or four broad. The ripe fruit is made into sauce or preserved in sugar, and the juice of the unripe fruit is used to remove freckles. The leaves are employed as a substitute for soap. *C. digitata*, a tree which grows in Brazil, where it is called chamburu, is regarded almost with superstitious awe as a deadly poison. For the North American species, see PAPAW.

Caricature and **Caricaturists.** The two great modern cartoonists have been Sir John Tenniel and Thomas Nast, the former being to all Europe what the latter was to all America, and in connection with these two can be said all that need be said of caricaturists of our time. True, Nast was practically alone in his field, and he did not work as long as did Tenniel, still, to judge him at his best, though the period was comparatively short, he stood high as a picture-maker of that class. Nast was as brave as his subject, Tweed, was crooked, and the two furnished the best series of caricatures by far that have ever been seen in this, or, it might be said, in any other country. Nast, however, was not the draughtsman that Tenniel was, but what he lacked in artistic finish, he made up in power and force of expression.

Since the day of Tenniel and Nast, caricaturing seems to have fallen into less virile hands. Tenniel and Nast each drew a caricature once a week, while now caricaturists draw seven or eight in that time. Formerly the best caricaturists were employed on the weekly papers, while now the better class are employed on the great dailies. But the times have brought this about, not necessarily the caricaturists. Workingmen have no time to read, and a picture which may tell all at a glance means more to them than the ablest editorial that the combined editors of the country could write. A picture can be understood by all, whereas we have many languages and we speak but few, and read fewer. Words we forget, but pictures stay, filed away in our minds, and we refer to them

on a moment's notice. Every day, as the pace quickens, and the press for time increases, we find our time for reading diminishes, thus the biograph excels the finest description ever written of the same thing.

We sometimes see so-called comic art, which is not comic, and called caricatures which are not true caricatures. A man who draws a picture of a man with a broad grin and winking with one eye, or cross-eyed, or perhaps a man standing with one foot on his other toe, is not necessarily a caricaturist any more than is the man who puts big feet and big noses on every person he draws. A young caricaturist who had submitted a picture to a critic for his judgment and had received a severe lecture on the bad drawing it displayed, made an attempt to hide behind the fact that it was a caricature, and therefore shouldn't be considered as the critic was considering it. Whereupon he replied: "No, never try to hide behind that. Remember one thing: that poor drawing is not caricature, and another, that all the bad artists in the country are not caricaturists. On the contrary, those who exaggerate the salient features must draw them even better, as more attention is called to a big nose or large ears if they are made conspicuously large, than would be the case otherwise."

But there is something else that a successful caricaturist must possess. That one thing, whatever it may be called, is of more importance than the art of drawing properly, and is a certain force of character, or of individuality which at once suggests strength of purpose and power. It can convey the feeling of sadness, of brute force, or excruciating mirth, yet many very fine draughtsmen who are styled caricaturists, never draw with that spirit predominant, and without it their productions are not true caricatures.

Thus, in trying to be caricaturists, such men are robbed of the chance of being serious illustrators, in which work they might succeed; and they never succeed as caricaturists.

There are three kinds of good caricatures: First, the strong, powerful, almost brutal; second, the humorous, the one instantly compelling laughter; and last, but not the least in effect, the pathetic; a picture capable of causing men to weep. The most effective are the powerful and the pathetic. The humorous is indeed attractive, if not overdone, but you soon forget its meaning. It can attack any and all things, from the weather to the President, without offense. But the most effective caricature is one that the subject of which would rather you would not print. Probably none can be made more powerful than the pathetic when it is timed and tempered just right, as its appeal to the sympathy is the surest way to the emotions. No caricaturist ever drew a caricature that would cause people to shed tears on seeing it, unless the artist shed tears when he drew it, any more than one could draw an angry political boss unless at the time of drawing one wore the same angry and hateful expression on one's own face. So with the humorist. One must wear a broad smile when he draws a man laughing, unless one is drawing him from life; and unless one is smiling when drawing smiling people, the subjects will seem to look and laugh only in mechanical fashion.

If the caricaturist is strong enough in his line to be called one, the first person he wins is himself. Once he has settled in his own mind that he is working for a just cause, it will be noticed at once that his work improves, and if he continues to study and put his heart and soul into it, others will be converted and he will acquire a following. If a cartoonist in his politics keeps side by side with his pictures he will be much more of a caricaturist than one who will work on a Democratic paper one day and the next on the Republican side. A young man in starting out should study and choose for himself and in that way he will find that he can lend more power and force to his work. It would be hard to imagine Thomas Nast being in private life a sympathizer with Tweed. The difficulty with caricaturists is that they are sometimes like the politician after the election, when he says: "No wonder the other side won; 'they bought us.' " What interest could one take outside of the mechanical reproduction if one knew that the caricaturist who had one year drawn powerful caricatures for one party would turn around the next year and work for the opposition. The power of a caricature becomes power only when the reader of the picture is convinced that that which is represented in the picture really did happen, and that cannot be done by a caricaturist if one day he is with the poor, and the next day with the rich; or in the same relation with any case that comes up.

The late John J. Ingalls said that the caricature did harm that good might follow. Caricatures, to be effective, should be founded on fragments of truth, though you are permitted to dig below the frost line. Without truth at the bottom they are powerless, and with truth at the bottom they are powerful and everlasting. Though Tweed, the man, is dead, Tweed, in the caricature, still lives, a prisoner in stripes, with ball and chain to his leg. A good caricature may be called an exaggeration of the truth. In these times there are great opportunities for the cartoonist. The billionaire will have to deal kindly and justly with his fellowmen, or else he will be more of a target than ever before, but the honest man need never fear a caricature; on the contrary, he can laugh and go about his business, and if he is attacked, the attacks will react in his favor. But they cannot be recommended as the steady diet for a dishonest person, since whether he has conscience or not, if they don't bring him to justice they will give him many a sleepless night.

Bibliography.— Flögel, 'Geschichte des Grotesk-Komischen' (1778); Champfleury, 'Histoire général de la caricature' (1865–80); Wright, 'History of Caricature and Grotesque' (1875); Parton, 'Caricature and Other Comic Arts' (1877); Grand Cartaret, 'Les moeurs et la caricature en Allemagne, en Aubriche et en Suisse' (1885); Everitt, 'English Caricaturists of the 19th Century' (1886).

HOMER DAVENPORT,
New York World.

Caries, kār'ī-ēz, a form of local death in bone, due to a variety of agents. Caries is usually distinguished from necrosis, another type of local death in bone, by the slower disintegration of the bone affected by the carious process. Necrosis usually results in the death of large pieces of bone, with the formation of sequestra.

Caries is a gradual disintegration without sequestration. Caries is the result of inflammation of the softer tissues in the bone spaces, and is due usually to some definite form of irritant. It may be that of a gas, such as chlorine, or phosphorus, the latter causing in match-workers a form of caries of the jaw; but bacteria of tuberculosis and syphilis are the most frequent causes. Tuberculous caries is the most frequent form of the disease. See HIP JOINT DISEASE; TUBERCULOSIS OF BONE.

For caries of the teeth, see TEETH.

Carigara, kä-rē-gä'ra, Philippines, a town of the province of Leyte, situated on the north coast of the island, 22 miles west of Tacloban. It has a harbor formed by a bight extending 11 miles inland, carries on a considerable coast trade, and is an important hemp port. Pop. 14,000.

Carignano, kä-rēn-yä'nō, Italy, a city in the province of Turin, 11 miles south of the latter on the left bank of the Po. It is surrounded by old walls, and has a handsome square ornamented with arcades, some fine churches, some silk-spinning mills, and sugar-refineries. From this town is named a branch of the house of Savoy. Pop. 7,000.

Carillon, kä-rē-yŏn, a kind of chime, played either by hand or clockwork on a number of bells, forming a complete series or scale of tones or semi-tones, like those of the organ or harpsichord.

Carimata, kä-rē-mä'ta, or **Karimata,** a name applied to the strait between Borneo and Billiton; also to a cluster of a hundred islets and reefs (area, 57 square miles; pop. 500) in that strait; and lastly, to the principal member of the group, whose highest point reaches 2,600 feet.

Carina'tæ, the name given by Merrem to one of the primary divisions of birds, variously ranked as an order (Huxley), a subclass (most modern ornithologists) an intermediate division (Gadow), or split up and distributed (Stejneger). The sternum is provided with a median keel or carina for the attachment of the chief muscles of flight. In a few flightless members, as the dodo, the keel has become abortive, and a few birds not generally recognized as belonging to the *Carinatæ* have keeled sterna, but are distinguished by other characters, such as the possession of a lizard-like tail, or a dromæognathous palate. The vast majority of living birds are carinate.

Carini, kä-rē'nē, Italy, a city in the island of Sicily, 11 miles northwest of Palermo. It is beautifully situated four miles from the sea, in a fertile region. It has a Gothic castle of the 14th century. Fishing is the chief occupation. The district produces much corn and wine. Pop. about 14,000.

Carin'thia (Ger. KÄRNTHEN), a duchy or province of Austria, between lat. 46° 24′ and 47° 7′ N., and lon. 12° 35′ and 15° 10′ E., bounded on the north by Salzburg and Styria, on the east by Styria, on the south by Carniola, and on the west by Italy and Tyrol; area, 3,986 square miles. It is extremely mountainous, generally sterile, and one of the most thinly populated provinces of Austria. The arable land does not exceed 290,000 acres, but there are some fertile valleys, and a considerable extent of rich pasture land. It has several rivers and lakes. Of the former the principal is the Drave. All of them abound with fish. The country does not yield corn enough for the consumption of the inhabitants, who import the deficiency from Hungary. The cereals most extensively cultivated are rye and oats. Some wine is produced in Lower Carinthia, but it is of inferior quality. Cattle, sheep, and horses are raised in considerable numbers, but the mines of Carinthia are the main sources of its wealth. The chief of these are lead, iron, and calamine. Various kinds of gems are met with. Its operative industry is chiefly confined to the working of its metallic ores, though there are also manufactories of woolens, cottons, silk stuffs, etc., most of which are in Klagenfurt, the capital. The principal towns are Klagenfurt and Villach. Carinthia formed part of the empire of Charlemagne, and afterward belonged to the dukes of Friuli. It subsequently passed through various hands, and finally became an appendage of the Austrian crown in 1321. In 1809 it was annexed to the empire of Napoleon, but was restored to Austria in 1814. Nearly all the inhabitants are Roman Catholics. Pop. (1900) 367,344.

Cari'nus, Marcus Aurelius, Roman emperor: d. 285 A.D. He was the elder of the two sons of the Roman emperor Carus, who conjointly succeeded to the throne on the death of their father, 284 A.D. His brother was supposed to have been murdered on his return from the East, and Carinus, ruling alone, became one of the most profligate and cruel of the Roman emperors. The soldiers having rebelled, and proclaimed Diocletian, Carinus collected the troops that were in Italy and marched into Mœsia to meet Diocletian, and quell the revolt. A decisive battle was fought near Margus, in which Carinus gained the victory, but in the moment of triumph he was slain by one of his own officers, whom the vices of the emperor had outraged.

Caripe, kä-rē'pā, Venezuela, a town situated in a valley on the northern part of the province of Bermudez. It was formerly the headquarters of the Capuchins, and contains the ruins of their church cloister. In the vicinity are the large caves, described by Humboldt, in which lives the bird known as guacharo, a kind of nighthawk. Pop. about 4,000.

Carisbrooke, kăr'ĭs-brŭk, England, a village in Hampshire, pleasantly situated at the foot of a hill, near the centre of the Isle of Wight, and overlooked by the ruins of its ancient castle, where Charles I. was imprisoned 13 months, previous to his trial and execution. The castle and grounds cover 20 acres. The parish church of St. Mary is a venerable structure, with a fine tower containing a chime of bells. It was formerly attached to a Benedictine priory founded under William the Conqueror, but the priory no longer exists. In 1859 a Roman villa was discovered at Carisbrooke, and the place seems to have been a fortress at the time of the Roman occupation. Pop. about 9,000.

Carissimi, Giacomo, jä'kō-mō kä-rēs'sē-mē, Italian composer: b. Marino, 1604; d. Rome, 12 Jan. 1674. He became musical director of the church of St. Apollinaris in Rome in 1628, and continued in that position until his death. He wrote many oratorios, cantatas, and

motets, and has been praised for his characteristic expression of feeling, and his easy, flowing style. He deserves most honor for the improvement of the recitative, having given it a more expressive and natural language, and he greatly developed the sacred cantata. His oratorio 'Jonah' has been revived in recent times. It anticipates in the descriptive passages some of the effects since elaborated by the modern classical composers, and it is altogether distinguished by freedom, boldness, and striking antiphonal imitations.

Carita, kä-rē-ta' (Italian from the Latin *caritas,* love), a name, in the fine arts, applied to the representation of Christian love. It is exhibited under the figure of a tender mother, in the midst of her children, manifesting her kindness and affection for them.

Carl, William C., American organist: b. Bloomfield, N. J., 2 March 1865. He is a member of the American Guild of Organists, a director of the Guilmant Organ School, New York, and organist of the First Presbyterian Church there. He has published 'Several Songs and Organ Arrangements' (1892); 'Masterpieces for the Organ' (1898); 'Thirty Postludes for the Organ' (1900).

Carlen, kär-lān', **Emilia Smith Flygare,** Swedish novelist: b. Strömstad, 8 Aug. 1807; d. Stockholm, 5 Feb. 1892. In 1838 she published her first novel, 'Waldemar Klein,' and among the best of her subsequent works are the 'Professor' (1840); 'A Year' (1846); 'The Brother's Bet'; and 'The Guardian' (1851). Several of her novels have been translated into English. In 1827 she married a physician named Flygare, and in 1841, after the death of her first husband, she married J. G. Carlén (q.v.), a lawyer and poet. In 1878 she published a volume of 'Reminiscences of Swedish Literary Life.' She had clear insight into the conditions of human life, especially of life in the middle class, and she describes it with admirable fidelity.

Carlén, Johan Gabriel, yō'hän gä'brē ĕl, Swedish poet and romancer: b. Westgotland, Sweden, 9 July 1814; d. Stockholm, 6 July 1875. He was the second husband of Emilia Carlen (q.v.), and was the author of 'Romanser Svenska Volklifet' ('Romances of Swedish Life') (1840); etc.

Carlén, Rosa, Swedish novelist: b. 1836; d. 1883. Her first story, 'Agnes Tell' (1861), had a very favorable reception. Then followed 'Tuva' (1862); 'Helena, a Woman's History' (1863); 'Three Years and Three Days' (1864); 'The Gypsy's Son' (1866), which is regarded as her most perfect work.

Carles, kär'lās, Philippines, a town of the province of Iloilo, situated on the northeastern point of the island of Panay, in what was formerly the district of Concepcion. Pop. about 10,000.

Carleton, kärl'tŏn, Sir **Guy,** Lord Dorchester, British general: b. Ireland, 3 Sept. 1724; d. Maidenhead, England, 10 Nov. 1808. He distinguished himself at the sieges of Louisburg, Quebec, and Belle Isle, and was wounded in 1762 at the siege of Havana. In 1772 he was made governor of Quebec. On the nomination of Burgoyne to the command, he threw up his commission, but was appointed the same year lieutenant-general, and succeeded Sir Henry Clinton as commander-in-chief in the American colonies.

Carleton, Henry Guy, American journalist and dramatist: b. Fort Union, New Mexico, 21 June 1855. He pursued journalism in New Orleans and New York, and has written several plays, including 'Memnon, a Tragedy'; 'Victor Durand' (presented 1884); and 'The Pembertons' (presented 1890).

Carleton, James Henry, American soldier: b. Maine, 1814; d. San Antonio, Texas, 7 Jan. 1873. In February 1839 he took part in the "Aroostook war," relative to the northeast boundary of the United States, and later was commissioned second lieutenant in the 1st United States Dragoons. In 1846 he took part in Kearny's expedition to the Rocky Mountains, served on Gen. Wool's staff in the Mexican war, receiving the brevet rank of major for gallantry at Buena Vista; and later was chiefly employed in exploring expeditions and against hostile Indians. In 1861 he was ordered to southern California, raised the famous "California column," and marched across the Yuma and Gila deserts to Mesilla on the Rio Grande. As commander of the Department of New Mexico he was active in a number of severe engagements. For his services he was brevetted major-general, 13 March 1865; became lieutenant-colonel of the 4th Cavalry, 31 July 1866; and was promoted colonel of the 2d Cavalry, June 1868, and ordered with his regiment to Texas. He wrote 'The Battle of Buena Vista' (1848).

Carleton, Will, American poet: b. Hudson, Mich., 21 Oct. 1845. He is best known in literature by his ballads of home life, many of them having gained great popularity. His books include 'Poems' (1871); 'Farm Legends' (1875); 'City Ballads' (1888); 'City Legends' (1889); 'City Festivals'; 'Rhymes of Our Planet'; 'The Old Infant, and Similar Stories'; 'Young Folks' Centennial Rhymes.'

Carleton, William, Irish novelist: b. Prillisk, County of Tyrone, 1794; d. Dublin, 30 Jan. 1869. Son of a peasant, he had to endure all the miseries of a poor Irishman's lot. His education commenced at a hedge-school, and terminated with two years' training in an academy at Glasslough. Thence he went to Dublin, with about three shillings in his pocket, and after a little began to support himself by private teaching. He also began writing for the 'Christian Examiner,' and in 1830 published his 'Traits and Stories of the Irish Peasantry.' Popular tastes and critical judgment were both satisfied by the novelty of contents and freshness of style. A second series followed in 1833, and was as universally welcomed. Among later works of his are 'Fardorougha, the Miser' (1839); 'The Misfortunes of Barney Branagan' (1841); 'Valentine M'Clutchy' (1845); 'The Black Prophet' (1847); 'The Tithe Proctor' (1849); 'Willy Reilly' (1855); and 'The Evil Eye' (1860). Ireland has found in Carleton a faithful and fearless exponent of her thoughts and feelings; but outsiders cannot help thinking him somewhat too much of a partisan. He enjoyed a government allowance of £200 per annum several years before his death.

Carleton College, a co-educational institution in Northfield, Minn.; organized in 1866 under the auspices of the Congregational Church. In 1903 it had 14 instructors, 218 students, 17,000 volumes in its library and its property, including endowment, was estimated at $683,777.

Carli, Giovanni Rinaldo, jō-vän'nē rē-näl'-dō kär lē, COUNT, Italian writer: b. Capo d'Istria, 11 April 1720; d. 22 Feb. 1795. He was of an ancient, noble family, and early manifested an inclination for the study of the Middle Ages, with which he connected the study of belles-lettres and of poetry. In his 24th year the senate of Venice made him professor of astronomy and naval science. The care which his large estates required compelled Carli to resign his professorship and retire to Istria, where he spent his time in the study of antiquities, on which he wrote some valuable treatises. He was afterward appointed by the emperor president of the highest commercial court at Milan, and subsequently president of the College of Finance in the same city. He published his works (1784–94) in 15 volumes, under the title 'Opere del Sig. Commendatore D. Gian Rinaldo, Conte Carli, Presidente,' etc., but this edition does not include his 'Delle Monete' (1754–60); and 'Delle Antichità Italiche' (1788–91).

Car'lin, Thomas, American politician: b. Kentucky, 1790; d. 2 Feb. 1852. He removed to Illinois in 1813, and gradually accumulated wealth, and became known and respected among the scattered population about him. He was elected governor in 1838, and retained that office for four years, during a period of unusual and violent political excitement. Illinois, having engaged largely in internal improvements, suffered severely from the commercial revulsion which was then paralyzing the whole country. She was much in debt, and had within her borders no specie, and no available means of payment. The discussion of the slavery question, too, was then furious, and had just led to the tragic death of E. P. Lovejoy. At the same time the Mormons took up their position at Nauvoo, and politicians were beginning those movements for partisan ends which seemed likely to throw the State into anarchy, and which ended ere long in the violent death of the Mormon leader. That Gov. Carlin, amid such a condition of affairs, was three times re-elected to the chief magistracy, affords a sure indication both of his popularity and his force of character.

Carline Thistle. See THISTLE.

Car'linville, Ill., a city and county-seat of Macoupin County, 60 miles southwest of Springfield; on the Chicago & Alton, and other railroads. It has a prosperous local trade and manufactures of bricks and tiles, agricultural implements, etc. There are coal-mines in the vicinity. It is the seat of Blackburn University, a Presbyterian institution. Its court-house is considered one of the finest public buildings in the State. Pop. (1900) 3,502.

Carlisle, kär līl', **George William Frederic Howard,** 7th earl, b. 18 April 1802; d. 4 Dec. 1864. He became earl 7 Oct. 1848, previous to which, as Lord Morpeth, he had traveled extensively in the United States. He was a long time attaché to the British embassy at St. Petersburg. In the reformed House of Commons he represented the West Riding of Yorkshire, and under the Melbourne ministry was secretary of state for Ireland. In 1841 he was defeated in the West Riding by his Conservative opponents. In 1846, under the administration of Lord John Russell, he was appointed commissioner of woods and forests, and chancellor of the duchy of Lancaster. He was the first of the Whig noblemen of the official class to give in his adhesion to the views of the Anti-Corn Law League. In 1856 he delivered before the Mechanics' Institute at Leeds two lectures, since published, on the life and writings of Pope, and on the United States. Previous to the Crimean war, he made a tour in the east of Europe, and published his 'Diary in Turkish and Greek Waters.' On the accession of Lord Palmerston in 1855, he was nominated lord lieutenant of Ireland, which office he held till the resignation of the Palmerston ministry in 1858. A work by him entitled 'The Second Vision of Daniel' was published in 1858.

Carlisle, John Griffin, American statesman: b. Kenton County, Ky., 5 Sept. 1835. He received a common-school education, studied law, and was admitted to the bar in 1858. He served several terms in the lower house of the State legislature. During the Civil War he actively opposed secession, and in 1866 and 1869 was a member of the State senate. He was lieutenant-governor of Kentucky, 1871–5; was elected to Congress, 1876, and five times re-elected. His ability soon made him one of the Democratic leaders. In the 48th, 49th, and 50th congresses he was chosen speaker. In 1890 he was elected United States senator, but resigned in March 1893, to accept the portfolio of secretary of the treasury in President Cleveland's Cabinet. At the close of his term he settled in New York to practise law.

Carlisle, England, city and capital of Cumberlandshire; at the confluence of the Caldew and Eden rivers. It has steamboat and railroad communications with Liverpool, Belfast, etc. Ginghams, cotton checks, etc., are its chief manufactures. Its most noted building is a cathedral founded by William Rufus. It lost its nave, with the exception of the two eastern bays, during the civil war, but the choir, 138 feet long, is very beautiful and contains an east window, by many judges esteemed the finest in England. There is also a castle, founded in 1092. Carlisle was the ancient capital of the kings of Cumbria, and was sacked by the Danes in 900. During the English and Scotch border-wars it was frequently besieged. It was here that Buccleuch rescued Kinmont Willie. During the civil war the town twice surrendered to the Parliamentarians (1645 and 1648). Pop. (1901) 45,000. See Creighton, 'Carlisle' in 'Historic Towns' series (1889).

Carlisle, Pa., borough and county-seat of Cumberland County, on the Cumberland V., and the Gettysburg & H. R.R.'s; 18 miles west of Harrisburg. It is the farming and manufacturing trade centre of Cumberland County, and is the site of Dickinson College, founded 1783, Metzger Female College, and the United States Indian Training School. It has a national bank, large manufacturing establishments, Hamilton Library, Todd Hospital, and an assessed

property valuation of $3,000,000. It was the headquarters of Washington during the Whisky Rebellion in 1794, and was bombarded by the Confederates in 1863. Pop. (1900) 9,626.

Carlisle Indian School. See UNITED STATES INDIAN TRAINING AND INDUSTRIAL SCHOOL.

Carl'ists, a Spanish political faction which advocates the claims of Carlos of Bourbon and his descendants to the Spanish throne. In 1833 the Carlists, whose chief strength lay in the Basque provinces, and who, because of their Catholic traditions and tendencies, were secretly favored by the Pope and the eastern powers, raised the standard of revolt. They had the advantage until 1836, when Espartero inflicted on them a terrific defeat at Luchana. In August 1839 their commander, Maroto, treacherously made peace, and the remaining Carlists soon fled to France. In 1873 the grandson of the first pretender raised another revolt in the Basque provinces of Navarre and Biscay, but after several sharp conflicts the rebels were hemmed in along the north coast, and in 1876 the pretender and his chief supporters fled into France.

Carll, John Franklin, American geologist: b. Long Island, N. Y., 7 May 1828. He became identified with coal oil development early in life, and has perfected many oil-pumping devices. Since 1874 he has been connected with the Pennsylvania Geological Survey.

Carlone, kär-lō'nā, the name of an Italian family of distinguished artists, who flourished chiefly in the 17th and 18th centuries. The most celebrated of them are: 1. TADDEO, a native of Lombardy, who excelled in sculpture, and was employed, along with his brother Joseph, by the courts of England, Spain, and Mantua; d. 1613. 2. GIOVANNI, eldest son of Taddeo: b. Genoa, 1590; d. 1630. He made great progress in painting under the tuition of his father and Peter Sorri, and, having afterward studied under Passignano, distinguished himself particularly by his frescoes, in which the freedom and spirit of his design, the depth of his expression, grandeur of his conception, and the richness of his coloring are particularly admired. 3. GIOVANNI BATTISTA, brother of the former: b. Genoa, 1598; d. 1659 or 1680. He was also a scholar of Passignano, and painted with his brother, whose style he followed so exactly that it is difficult to distinguish their pictures. He ultimately entered the service of the Duke of Savoy. He excelled particularly in frescoes, which are so soft, fresh, and uniform that they resemble oil paintings. 4. ANDREA, son of Giovanni Battista: b. 1627; d. 1697. He rose to great eminence as a painter. He took chiefly for his models Titian, Veronese, and Tintoretto, and founded a school of painting in Perugia.

Carlos de Bourbon, DON MARIA ISIDOR, mä-rē'ä ēs'ẹ-dôr, second son of Charles IV. of Spain and brother of Ferdinand VII.: b. 29 March 1788; d. Trieste, 10 March 1855. In 1808 he was compelled by Napoleon along with his brother, who had now succeeded to the throne, to renounce all claims to the succession, and was detained with Ferdinand in captivity at Valençay in France till 1814. In 1816 he married Maria Francisca d'Assis, daughter of John VI. of Portugal, his brother the king of Spain having at the same time espoused another daughter of John as his second wife. This last marriage, like Ferdinand's first, having turned out unproductive of issue, a prospect opened to Don Carlos of succeeding to the crown, which almost assumed the shape of absolute certainty when a third marriage contracted by Ferdinand proved equally unsuccessful with the two former in producing an heir to the Spanish monarchy. On the death of Ferdinand's third wife in 1829 he again married, and, by a pragmatic sanction, the contingency of a female heir was provided for by the repeal of the Salic law, which excluded such from the throne. On 10 Oct. 1830, Maria Isabella, afterward queen of Spain, was born. In 1832 Don Carlos' party succeeded by taking advantage of the king's imbecile condition to obtain a repeal of the pragmatic sanction; but this advantage was only temporary, as Ferdinand disowned his act on recovering the use of his reason. The following year Don Carlos was exiled with his wife to Portugal; and having refused to return from thence to be present at the taking of the oath of allegiance to the young queen, he was commanded by Ferdinand to retire to the Papal States. On 29 Sept. 1833 Ferdinand VII. died, and a few days afterward his consort the queen-regent repeated the order to his brother to quit the country. The latter, however, now announced himself as legitimate king of Spain, and was recognized as such by a considerable party who excited a civil war in his favor, and thenceforward were designated by the title of Carlists. After a course of hostilities extending over several years with varying success, he found himself obliged in 1839 to take shelter in France. In the meantime he and his descendants had been formally excluded from the succession by a vote of the Cortes in 1836. On arriving in France the castle of Bourges was assigned him as a residence, and he was also detained a prisoner there for a considerable time owing to his refusal to make the renunciations demanded of him. In 1845 he resigned his claims in favor of his eldest son, and in 1847 was permitted to take up his abode in Trieste, where he died.

Carlos, Don, dŏn kär'lōs, Infant of Spain, son of Philip II. and Maria of Portugal: b. Valladolid, 8 July 1545; d. 1568. He was sickly, and one of his legs was shorter than the other. The extreme indulgence with which he was educated by Joan, sister of the king, confirmed his violent, obstinate, and vindictive disposition. In 1560 Philip caused him to be acknowledged heir of the throne by the estates assembled at Toledo, and in 1562 he sent him to the University of Alcala de Henares in hopes that the study of the sciences would soften his turbulent character. Contemporary historians differ in the description of the prince. According to some he had a thirst for glory, an elevated courage, pride, and a love of power. According to others he was fond of whatever was strange and uncommon; an accident or opposition irritated him to frenzy; address and submission softened him. He is also represented as a favorer of the insurgents in the Netherlands, and in particular as an enemy of the Inquisition; yet he possessed neither knowledge nor principles, nor even sufficient understanding to be capable of liberal views. With him all was passionate excitement, which resistance converted into fury. Llorente has corrected the

accounts of the character and fate of this prince from authentic sources in his work on the Spanish Inquisition (q.v.). According to him Don Carlos was arrogant, brutal, ignorant, and ill-educated. This much is certain, that at the Congress of Cateau Cambrésis (1559) the marriage of Don Carlos with Elizabeth, daughter of Henry II. of France, was proposed; but Philip, being left a widower by the death of Mary of England, took the place of his son. Don Carlos is said to have loved Elizabeth, and to have never forgiven his father for having deprived him of her. Llorente proves, however, that Don Carlos never had fallen in love with the queen, and that she was never too intimate with him. In 1563 Philip, who had no other heir than Don Carlos, considering him unfit for the throne, sent for his nephews, the archdukes Rodolph and Ernestus, to secure to them the succession to his dominions. Don Carlos, who lived in continual misunderstanding with his father, resolved in 1565 to leave Spain, and was on the point of embarking when Ruy Gomez de Silva, a confidant both of Philip and Carlos, dissuaded him from his resolution. In 1567, when the rebellion in the Low Countries disquieted Philip, Don Carlos wrote to several grandees of the kingdom that he had the intention of going to Germany. He disclosed his plan to his uncle, Don John of Austria, who told Philip what Don Carlos had confided to him. It is believed that he was touched by the sufferings of the people of the Netherlands. Philip himself seemed to believe that his son intended to go to the Netherlands. The infant had often shown a vehement desire to participate in the government. But Philip, jealous of his own authority, treated his son coolly and with reserve, while he gave his confidence to the Duke of Alva, to Ruy Gomez de Silva, Don Juan of Austria, and Spinola. Don Carlos conceived an invincible aversion to them. The architect of the Escurial, Louis de Foix, narrates the following story relating to Don Carlos, which has been preserved to us by De Thou. The prince had always under his pillow two naked swords, two loaded pistols, and at the side of his bed several guns, and a chest full of other firearms. He was often heard to complain that his father had deprived him of his bride. On Christmas evening he confessed to a priest that he had resolved to murder a man. The priest, therefore, refused him absolution. The prior of the monastery of Atocha artfully drew from him expressions from which it could be inferred that he meditated an attempt upon his own father. The story was then communicated to the king, who exclaimed, "I am the man whom my son intends to murder; but I shall take measures to prevent it." Thus Philip, impelled by hatred or fear, by policy or superstition, resolved on the destruction of his only son, in whom he saw only a criminal, unworthy of the crown. On the night of 18 Jan. 1568 while Don Carlos was buried in a deep sleep, Count Lerma entered his chamber and removed his arms. Then appeared the king, preceded by Ruy Gomez de Silva, the Duke of Feria, the grand prior of the order of St. John, brother of the Duke of Alva, and several officers of the guard, and state councilors. Don Carlos still slept. They awoke him: he beheld the king his father, and exclaimed, "I am a dead man." Then, addressing Philip, he said, "Does your majesty wish to kill me? I am not mad, but reduced to despair by my sufferings." He conjured with tears those who were present to put him to death. "I am not come," answered the king, "to put you to death, but to punish you as a father, and to bring you back to your duty." He then commanded him to rise, deprived him of his domestics, ordered a box of papers under his bed to be seized, and committed him to the care of the Duke of Feria and six noblemen, enjoining them not to permit him to write nor to speak with any one. These guards clothed Don Carlos in a mourning dress, took from his chamber the tapestry, the furniture, and even his bed. Don Carlos, full of rage and despair, caused a large fire to be kindled, under pretext of the extreme cold of the winter, and threw himself suddenly into the flames. It was with difficulty that he was rescued. He attempted by turns to finish his life by thirst, by hunger, by eating to excess. After Philip had endeavored to justify his measures to the Pope and the principal sovereigns of Europe, and had also given notice to the superior clergy, the courts of justice, and the cities of his empire, of what had passed, he referred the case of the prince, not to the Inquisition, but to the council of state, under the direction of Cardinal Espinosa, who was state councilor, grand inquisitor, and president of the junta of Castile. This court is said, after a minute examination and hearing many witnesses, to have condemned him to death. Other accounts, however, state that he died of a malignant fever before any judgment was passed, after having taken the sacrament with much devotion, and having asked his father's pardon, 24 July 1568. The melancholy fate of Don Carlos has served as a subject for several tragedies — those of Schiller, Alfieri, Otway, and Campistron.

Carlos, Don, COUNT DE MONTEMOLIN, son of Carlos de Bourbon (q.v.): b. 31 Jan. 1818; d. Trieste, 1861. He was long resident in London, and in 1850 married Maria Carolina Ferdinanda, a sister of Ferdinand II., king of Naples. On more than one occasion he endeavored to excite an insurrection in his favor in his native country, but these attempts were always frustrated. In 1860, when he made his last venture, he and his army were taken prisoners by the troops of Isabella. The rebel general was shot, and Don Carlos liberated only on condition of solemnly renouncing all claims to the crown — an act which he repudiated when he got out of the hands of his enemies.

Carlota, kär-lō'ṭa, Philippines, (1) a town of Negros Occidental, situated in the western part of the island of Negros, 20 miles south of Bacolod. Pop. 12,004. (2) A town in the eastern part of the island of Negros (Negros Oriental), where the insular government owns a plantation of 2,000 acres. Pop. 6,386.

Carlot'ta (MARIE CARLOTTA AMELIE), empress of Mexico: b. near Brussels, 7 June 1840. She was the daughter of Leopold I., king of Belgium, and married Maximilian, Archduke of Austria, 27 June 1857. In 1864 she went with her husband to Mexico and remained there till 1866, when the dissatisfaction against the empire forced her husband to send her to ask help from France. She could obtain no assistance from Napoleon III. and went to Rome

to appeal to the Pope. Before negotiations there were completed, her health gave way under the strain, and after the end of the empire and the execution of her husband she became totally insane. She was taken to the Château de Bouchoute, near Brussels, Belgium, where she lives, an incurable invalid.

Carlovin'gians, the second dynasty of the French or Frankish kings, which supplanted the Merovingians, deriving the name from Charles Martel or his grandson Charlemagne (that is, Karl or Charles the Great). Its origin is usually traced to Arnulph, a bishop of Metz, who died in 631. Charles Martel became mayor of the palace in 714 to the Merovingian *roi fainéant* Childeric, and in this office was succeeded by his son Pepin le Bref, who in 752 deposed the merely nominal king and himself assumed that title. He was succeeded by Charlemagne and his brother Carloman (768–771). Charlemagne became sole king in 771, and extended greatly the dominions of the family. In 800 Leo III. crowned him emperor of the west. On his death in 814 he was succeeded by his son Louis le Débonnaire. He divided his empire among his sons, and at his death, in 840, his son Charles the Bald became king of France. He died in 877, and was succeeded by a number of feeble princes. The dynasty came to an end with Louis V., who died in 987. The house of Capet followed it.

Carlovitz, or **Carlowitz.** See KARLOWITZ.

Carlow, kär-low, Ireland, an inland county in the province of Leinster, surrounded by Kildare, Wicklow, Wexford, Kilkenny, and Queen's County. It is generally level or undulating except in the southeastern parts. The chief rivers are the Slaney and Barrow. From the remarkable fertility of its soil it is altogether an agricultural county, producing a great deal of butter, corn, flour, and other agricultural produce for exportation. Agriculture is here carried on with as much skill and knowledge of recent improvements as anywhere in Ireland, and there is less poverty than in most parts. Area 353 square miles. Pop. (1901) 37,723.

Carlow, Ireland, a town of the county of Carlow, on the Barrow, 34 miles southwest of Dublin, with which it is connected by railway and canal. It has two principal streets intersecting at right angles. A bridge of five arches leads over the Barrow to the suburban village of Graigue, in Queen's County. The principal public buildings are the Roman Catholic cathedral and college, three convents, barracks, a lunatic asylum, a court-house, town-hall, union workhouse, an infirmary, and a fever hospital. It is lighted by electricity, and has an excellent water-supply. Carlow is the principal mart for the agricultural produce of the surrounding country, and carries on an extensive trade in corn, malt, butter, etc. On rising ground to the south stand the ruins of the ancient castle of Carlow, still presenting a very imposing appearance. Pop. (1901) 7,200.

Carlsbad, kärls'bät, Bohemia, a town on the Tepl, near its influx to the Eger, 116 miles west by north of Prague. It is widely celebrated for its hot mineral springs, and is frequented in summer by visitors of the most aristocratic character from all parts of Europe. In the season, April to October, the visitors number from 25,000 to 30,000. Set in most lovely scenery, the town is well built, and offers good accommodation for its guests. The temperature of the hot springs varies from 117° to 167° F. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of three feet from the ground. Altogether, the daily flow of the springs of Carlsbad is estimated at 2,000,000 gallons. The principal ingredient in the water is sulphate of soda. The whole town of Carlsbad appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. Ascribing its foundation to the Emperor Charles IV. (1347), Carlsbad was made a free town by Joseph I. Pop. (1903) about 15,000.

Carlsbad, Congress of, a conference of ministers representing Austria, Prussia, and many small German states, which met at Carlsbad in August 1819 to discuss the democratic tendencies then manifesting themselves in Germany. Its members recommended to their governments and to the German Diet, the famous 'Carlsbad Decrees,' which were adopted by the Diet, 20 Sept. 1819. Among the most important of the decrees were those recommending severe press censorship, the establishment at Mainz of a central commission for the investigation of political intrigues, the suppression of the secret student organization, the Burschenshaft, and government inspection of the universities.

Carlsburg, kärls'boorg, or **Karlsburg,** Austro-Hungary, a town (ancient Apulum) on the right bank of the Maros, 33 miles northwest of Hermannstadt. It consists of an upper and a lower town, situated on opposite sides of the river, and communicating by a long bridge. It is defended by a citadel, and has a cathedral with a number of ancient monuments, a mint where the gold and silver obtained in Transylvania are purified and coined, an observatory with a good collection of instruments, an excellent library, a theological college, a gymnasium, normal school, arsenal, and barracks. Pop. 8,000.

Carlscrona, kärls'krō-na, or **Karlskrona** ("Charles' Crown"), Sweden, a seaport at the southern extremity of the peninsula, on the Baltic, capital of the län or province of Blekinge or Carlscrona. It stands on several rocky islets connected with one another and with the mainland by bridges, has broad, clean, but somewhat steep streets, with houses mostly built of wood. The harbor is safe and spacious, the entrance protected by forts. It was founded by Charles XII. in 1680. As the chief Swedish naval station the town largely depends on the trade thereby occasioned, but it has also a considerable export trade in timber, tar, potash, tallow, etc. Pop. (1900) 23,955.

Carlsen, Emil, American artist: b. Denmark, 1848. He came to the United States in 1872 and studied art in Boston. Since 1891 he has lived in New York and has exhibited frequently there. His especial field is still life painting, but he is also favorably known as a landscape artist.

Carlshamn, kärls'häm ("Charles' Haven"), Sweden, a seaport town, 27 miles west of Carlscrona, in a beautiful valley at the mouth of the Mie-A. It is regularly built, and its

square market-place, planted on all sides with trees, has a fine appearance. It has an elegant town-house, a good harbor, and an active trade. Timber and articles of timber constitute the chief exports. The manufactures are sail-cloth, sacking, tobacco, leather, etc.; and there is also some ship-building. Pop. (1890) 7,191.

Carlson, kärl'sŏn, **Fredrik Ferdinand,** Swedish historian: b. Upland, 13 June 1811; d. Stockholm, 18 March 1887. He was prominent in public matters for many years, being minister of ecclesiastical affairs, 1863–70, and again, 1875–8. He wrote, among other works, a 'History of Sweden' (1855–87), which ranks high because of its exhaustive accuracy and literary merit.

Carlsruhe, kärls'roo-ŭ, or **Karlsruhe** ("Charles' Rest"), Germany, the capital of the grand-duchy of Baden. It was laid out in 1715, and is one of the most regularly built towns in Europe. The castle of the grand-duke stands in the centre of the city, and from this point a number of streets radiate fan fashion, at regular distances from each other. Other streets intersect these in parallel circles. The roads leading to the city correspond to this regular disposition, which, as is apt to be the case in strictly regular cities, often leaves upon the traveler the impression of monotony rather than that of agreeable order. The city is ornamented with several beautiful public buildings, including the palace, in front of which is a bronze statue of the founder of the city, the margrave, Charles William, the parliament house, town hall, etc. The court library contains 150,000 volumes; there are also here several valuable museums and cabinets, a botanic garden, several institutions for the promotion of literature and the fine arts, and sundry industrial establishments, such as a foundry and electro-plating work, an engine factory, carriage works, etc. Pop. (1900) 97,164.

Carlstad, kärl städ, Sweden, a town and the capital of the län of the same name, on an island in Lake Wener formed by the two mouths of the Klar, and connected with the mainland by a bridge across either stream. It is beautifully situated, regularly built, is the seat of a bishop, and has a cathedral, gymnasium, town-house, etc., and some trade in copper, timber, iron, and grain. Pop. (1900) 11,869.

Carlstadt, Andreas Rudolf, än'drā ās roo dŏlf kärl'stät, **Bodenstein,** German theologian: b. Carlstadt, Franconia, 1480; d. Basel, Switzerland, 25 Dec. 1541. He is celebrated in the history of the Reformation for his fanaticism as well as his misfortunes. He was appointed professor of theology at Wittenberg in 1513. His learning enabled him to render great support to Luther in his first steps for the introduction of a reformation. In 1520 he was included in the bull which condemned Luther; and his spirited appeal from the Pope to a general council, of which he gave the first example, as well as his opinion, openly expressed, in favor of the marriage of the priesthood, which soon gained ground, was among the many proofs which he gave of his zeal for the Reformation. While Luther was at Wartburg Carlstadt's zeal urged him to acts of violence. He even instigated the people and students to the destruction of the altars and the images of the saints, greatly to the displeasure of Luther, who lost the friendship of Carlstadt by his opposition to his excesses. In 1524 he publicly declared himself the opponent of Luther, and the Elector Frederick banished him from the country in September 1524. Carlstadt upon this commenced the controversy respecting the sacrament, denying, in opposition to Luther, the bodily presence of Christ in the sacramental elements, and recognizing in the rite a token of remembrance simply. This controversy was carried on with the bitterest animosity; and Zwinglius having declared himself in favor of Carlstadt's doctrine, a dispute ensued between the Swiss and Wittenberg theologians, which ended in the separation of the Calvinists and Lutherans. Carlstadt in the meantime, being suspected, not without reason, of having taken part in the revolt of the peasants in Franconia, was obliged to wander through Germany, and being ultimately reduced to extreme distress, sought relief of Luther, who procured him an asylum at Kemberg, on condition that he should refrain from the expression of his opinions. Here he lived nearly three years. His restless mind, however, soon led him to break his promise, by the publication of some writings in 1528; and he even went so far as to plot against Luther's person. To escape from the consequences of his conduct he repaired to Switzerland at the end of the same year, where he was appointed vicar of Altstadt, in the valley of the Rhine; in 1530, deacon at Zürich; and in 1534, vicar and professor of theology at Basel.

Carlstadt, Austria, a town in Croatia, 34 miles southwest of Agram, agreeably situated in a perfectly level and richlv cultivated plain near the junction of the Kulpa, Korana, and Dobra, which are here navigable. It consists of the town proper and the citadel, together with the suburb of Dubovacz. It is the seat of a Greek bishopric, is tolerably well built, and has an important trade. Pop. (1890) 5,559.

Carl'ton, Charles, Anglo-American educator: b. Eythorne, Kent, England, 21 Aug. 1821; d. Bonham, Texas, 13 Feb. 1902. He removed to Toronto, Ontario, spent several years as a seaman and subsequently while working on a farm at Fredonia, N. Y., studied for the ministry, and was graduated from Bethany College, W. Va., in 1849. He was successively pastor in Georgetown, Ky.; Lexington, Mo.; Little Rock and Van Buren, Ark., and in 1867 removed to Bonham which continued his home for the rest of his life. There he established a co-educational school called Bonham Seminary, which in 1882 changed its name to Carlton College and became an institution for women solely. He was a prominent leader in the Christian denomination in Texas.

Carlyle, kär-lil', **Alexander,** Scottish clergyman: b. Prestonpans, 26 Jan. 1722; d. Inveresk, 25 Aug. 1805. He was educated at the universities of Edinburgh and Glasgow, and afterward studied at the University of Leyden. Having been licensed as a preacher, in 1747 he was presented to the parish of Inveresk, in Mid Lothian, where he continued to the end of his life. He was one of the leaders of the Moderate party in the Scottish Church, the party which, during the latter half of the 18th century, ruled with such predominating sway, and included the names of Robertson, Blair, and Home among its members. As an eloquent debater and skilful

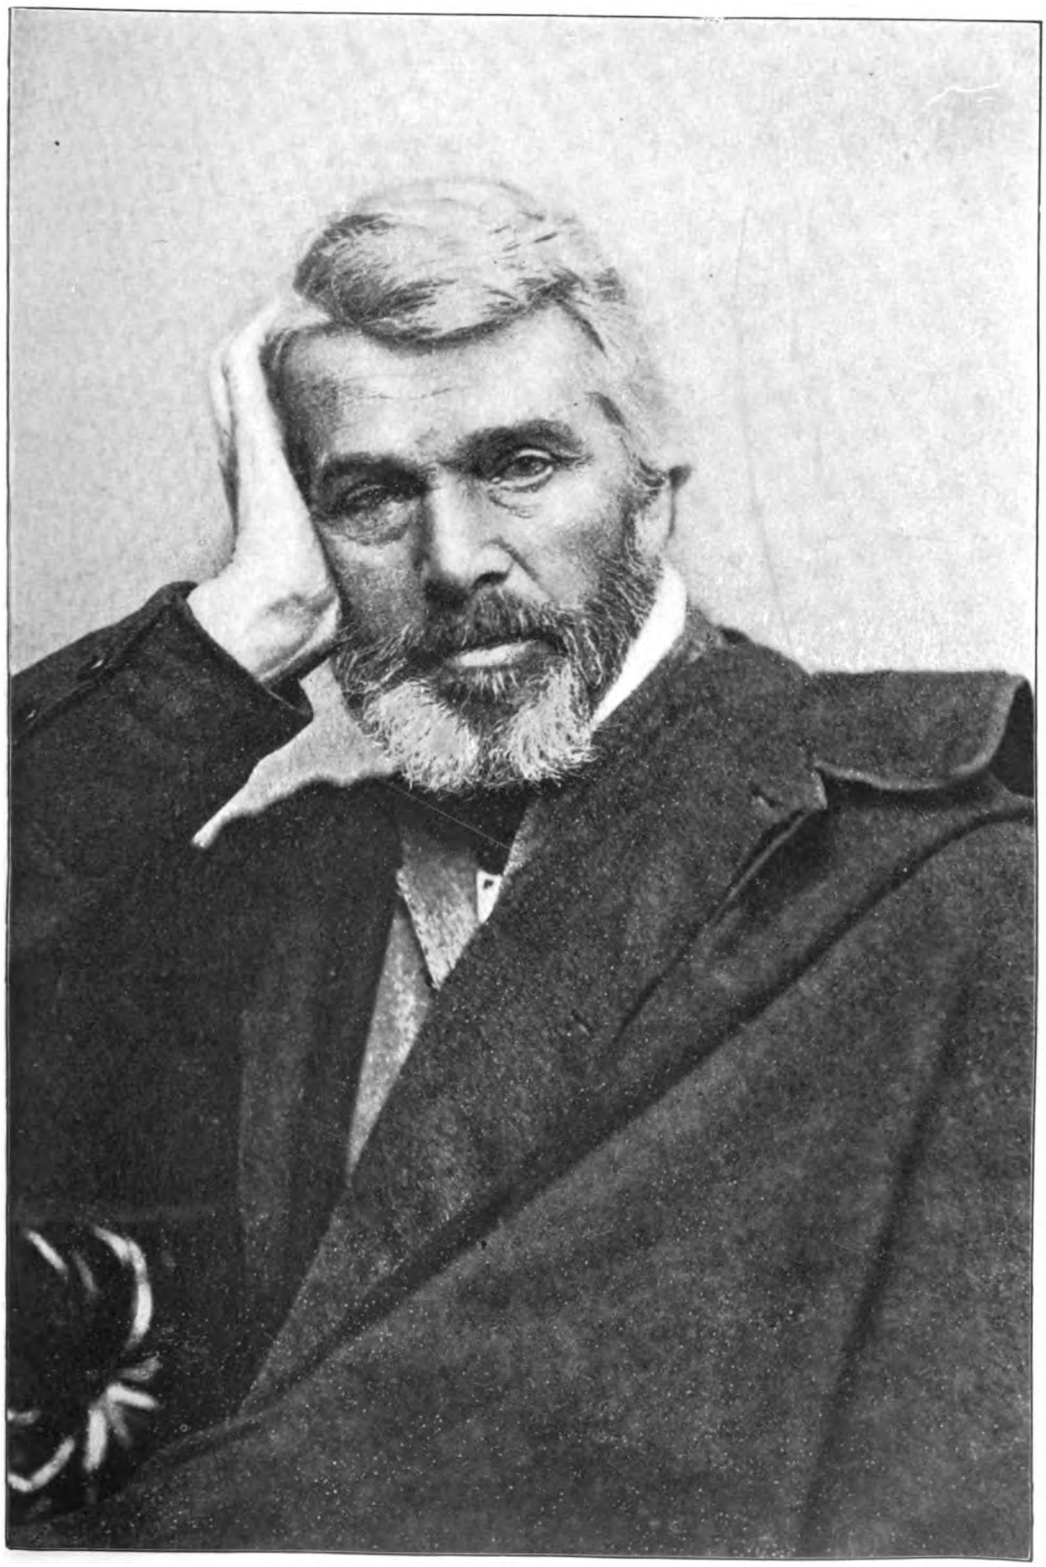
ecclesiastical leader in the General Assembly he had no rival. He strenuously resisted all attempts to give additional influence to the popular element in ecclesiastical matters. He left behind him a well-known autobiography, which, though commenced in his 79th year, is a singularly interesting production, both from the vigor and sprightliness of its style, and the pictures which it presents of Scottish society in the 18th century. After remaining long in manuscript it was published in 1860, under the editorship of John Hill Burton.

Carlyle, Jane Baillie Welsh, Scottish letter writer: b. Haddington, Scotland, 14 July 1801; d. London, 21 April 1866. She was the daughter of John Welsh, a Haddington surgeon, and was married to Thomas Carlyle (q.v.) 17 Oct. 1826. Her letters, edited by her husband, were published in 1883.

Carlyle, Thomas, Scottish critic and historian: b. Ecclefechan, Dumfriesshire, 4 Dec. 1795; d. Chelsea, London, 5 Feb. 1881. He was the eldest son of James Carlyle, a mason and afterward a farmer. James Carlyle was a serious, God-fearing man of great intellectual power, while his wife, Margaret Aitken, is represented to have been affectionate, pious, and intelligent. The elder Carlyle was a member of the dissenting body known as the Relief Church, and intended his son Thomas for a minister of this church, with which object he was carefully educated at the parish school and afterward at the burgh school of Annan. When only in his 15th year he was sent to the University of Edinburgh, where he studied under such professors as Leslie, Playfair, and Dr. Thomas Brown. Here he developed a strong taste for mathematics, a study in which he attained great proficiency. Having renounced the idea of becoming a minister, after finishing his curriculum in 1814, he became a teacher for about four years, first at Annan, afterward at Kirkcaldy, where he conducted the burgh school, and left behind him the character of an over-stern disciplinarian. At the latter place the celebrated Edward Irving (q.v.), whom he had first met during his school-boy days at Annan, was then also acting as a teacher, and the two became intimate friends. In 1818 he removed to Edinburgh, where he supported himself by literary work, devoted much time to the study of German, and went through a varied and extensive course of reading in history, poetry, romance, and other fields. His first literary productions were short biographies and other articles for the Edinburgh 'Encyclopædia,' an extensive work edited by Brewster. After three years of hard work and poverty in Edinburgh his health broke down, and he retired for a time to his father's farm in Dumfriesshire. He was next engaged to act as tutor to the sons of Mr. Buller, one of whom was afterward honorably known in public life. This post he held for about two years.

During this period his career as an author may be said to have really begun, with the issue in monthly portions of his 'Life of Schiller' in the London 'Magazine,' in 1823, this work being enlarged and published separately in 1825. In 1824 he published a translation of Legendre's Geometry, with an essay on proportion, by himself, prefixed, which Prof. De Morgan characterized as "thoughtful and ingenious, as good a substitute for the fifth book of Euclid as could have been given in the space." The same year appeared his translation of Goethe's 'Wilhelm Meister's Apprenticeship.' This work, which like the others mentioned, was anonymous, was on the whole favorably received, though some critics objected to the translator's too great fondness for German idioms. During his tutorship he stayed some time in London, where Irving then was. He was next engaged in translating specimens of the German romance writers, published 1827. In 1826 he married Miss Jane Welsh, daughter of a doctor at Haddington, and a lineal descendant of John Knox. After his marriage he resided for a time in Edinburgh, and then withdrew to a farm in Dumfriesshire belonging to his wife, about 15 miles from the town of Dumfries. This place, Craigenputtock, he describes in a letter to Goethe, in 1828, as "the loneliest nook in Britain, an oasis in a wilderness of heath and rock, among the granite hills and the black morasses which stretch westward through Galloway almost to the Irish Sea." Here he wrote a number of critical and biographical articles for various periodicals, such as the 'Edinburgh Review,' the 'Foreign Quarterly,' and 'Fraser's Magazine'; and here was written 'Sartor Resartus,' the most original of his works, the one which first brought him fame, and which has had perhaps a greater influence on the minds of readers than any single work that could be named. The writing of 'Sartor Resartus' occupied portions of several years. It seems to have been finished in 1831, but the publishers were shy of it, and it was not given to the public till 1833–4, through the medium of 'Fraser's Magazine.' The whimsical title of this work (literally 'The Tailor Repatched') is a translation of that of an old Scottish song ('The Tailor Done Over'). The book professes to be an exposition for English readers of a new philosophy, the philosophy of clothes, first thought out and expounded by Diogenes Teufelsdröckh (Devil's Dirt, Asafœtida), professor of things in general in the German university town of Weissnichtwo (Know-not-where, Scotch Kennaquhair); with biographical particulars regarding the professor, and miscellaneous thoughts, reflections, and speculations of his not strictly connected with his philosophy. The professor of course is really Carlyle himself, and the work is to some extent autobiographical. It is inspired by a distinctly didactic purpose, preaching through its wonderful intermixture of the humorous, the grotesque, the sublime, the pathetic, the solemn, the profound, welded together by a poetic or even a prophetic spirit, the doctrines of truthfulness, obedience, duty, work, and, above all, hatred of sham.

The publication of 'Sartor' (to which no author's name was originally attached) soon made Carlyle famous, and on his removal to London early in 1834 he became a prominent member of a brilliant literary circle embracing John Stuart Mill, Leigh Hunt, John Sterling, Julius Charles, and Augustus William Hare, Maurice, and his old pupil Charles Buller. He fixed his abode at Cheyne Row, Chelsea, where his life henceforth was mainly spent. His next work of importance was on the French Revolution, published in 1837. This, though a work of immense research, is hardly a history in the ordinary sense of the term; it is rather a series



THOMAS CARLYLE.

Mau

of powerful pictures, in which we see taking place the chief events and are made intimately acquainted with the chief actors of that stormy period. Of it the 'Westminster Review' remarked, "No work of greater genius, either historical or poetical, has been produced in this country for many years." The first volume of the 'French Revolution,' while still only in MS., was unfortunately burned while in John S. Mill's possession, and the author had immediately to set to work and write it over again. About this time, and on one or two subsequent years, he delivered several series of lectures, the most important of these, 'On Heroes and Hero-worship,' being published in 1840. 'Chartism,' published in 1839, and 'Past and Present,' in 1843, were small works bearing more or less on the affairs of the time. In 1845 appeared his 'Oliver Cromwell's Letters and Speeches, with Elucidations,' a work of great research, and brilliantly successful in vindicating the character of the great Protector. In 1850 came out his 'Latter-day Pamphlets,' a series of tracts dealing with political subjects, and assailing with extraordinary vehemence, not to say virulence, the most prominent institutions and characteristics of modern England and its people. This work was very repulsive to many from the exaggeration of its language, and its advocacy of harsh and coercive measures. He next wrote a life of his friend John Sterling, published in 1851, and regarded as a finished and artistic performance.

The largest and most laborious work of his life, 'The History of Friedrich II. of Prussia, called Frederick the Great,' next appeared, the first two volumes in 1858, the second two in 1862, and the last two in 1865, and after this time little came from his pen. His choice of Frederick as a hero strikes most people as a little remarkable, a feeling that the author was himself prepared for. He gives as his reasons for selecting him for historical treatment that he was the man that did almost the only real and substantial work in his century; that there was nothing of the hypocrite or sham about him; and that "How this man, officially a king withal, comported himself in the eighteenth century, and managed *not* to be a liar and charlatan as his century was, deserves to be seen a little by men and kings, and may silently have didactic meanings in it." He is reported to have said in conversation that he had tried to put a little humanity into Frederick, but found it hard work. Of the immense labor and research shown in this work, of the descriptive and narrative power displayed on almost every page, of the vividness with which a portrait is drawn, or an event put before us, it is almost impossible to speak too highly. At the same time it can hardly be denied that too often the author's powers as a skilled advocate have been enlisted in favor of "Vater Fritz" and his doings. Frederick the Great was soon translated into German, and has naturally been popular in Germany.

In 1866, having been elected lord rector of Edinburgh University, he delivered an installation address to the students 'On the Choice of Books.' While still in Scotland the sad news reached him that his wife had died suddenly in London. This was a severe blow to Carlyle. Mrs. Carlyle, besides being a woman of exceptional intellect, was a most devoted and affectionate wife. On her tombstone beside the abbey church of Haddington he has recorded her virtues and his sorrow for her loss, stating that at her death his light was as if gone out. From this time his productions were mostly articles or letters on topics of the day, including 'Shooting Niagara; and After?' in which he gave vent to his serious misgivings as to the results of the Reform Bill of 1867. An unimportant historical sketch, 'The Early Kings of Norway,' appeared in 1874, but was written long before. Carlyle died at Chelsea, and was buried at Ecclefechan. He left the estate of Craigenputtock to the University of Edinburgh, settling that the income from it should form ten bursaries to be annually competed for — five for proficiency in mathematics and five for classics (including English). In 1881 Carlyle's 'Reminiscences' connected with the earlier part of his life were published by J. A. Froude, who also published a biography of Carlyle (1882–4, 4 vols.), and edited the 'Letters and Memorials of Mrs. Carlyle' (1883). In the last-named year was published the 'Correspondence of Carlyle and Emerson' between 1834 and 1872.

Carlyle's command over the English language was greater than that of almost any other prose writer, and his style was unique. It has been called unnatural, a distortion of the English language, a mere literary device or affectation to attract notice; but this is but a superficial criticism. That it is often eccentric, often uncouth, often rugged, often extravagant, may be admitted; but one who studies it cannot but recognize that it was so only as being the natural vehicle of expressing his thoughts. It grew and developed as the writer grew and developed, and in his hands was an instrument of unsurpassable power. Lowell has said of him, "Though not the safest of guides in politics or practical philosophy, his value as an inspirer and awakener cannot be overestimated. It is a power which belongs only to the highest order of minds, for it is none but a divine fire that can so kindle and irradiate. The debt due him from those who listened to the teachings of his prime for revealing to them what sublime reserves of power even the humblest may find in manliness, sincerity, and self-reliance, can be paid with nothing short of reverential gratitude." See Wylie, 'Thomas Carlyle: the Man and His Books' (1881); Masson, 'Carlyle Personally and in His Writings' (1885); Lives by Garnett (1887); Nichol (1894).

Carmack, Edward Ward, American politician: b. near Castilian Springs, Summer County, Tenn., 5 Nov. 1858. He studied law and after admission to the bar practised his profession at Columbia, Tenn. He was member of the State legislature in 1884; was on the editorial staff of the 'Nashville American,' (1886–8), and in 1892 became editor of the 'Memphis Commercial.' He served two terms in Congress as Democratic representative from the 10th Tennessee district 1897–1901, and in the year last named was appointed to the United States Senate.

Carmagnola, Francesco, frän-chĕs'kō kär-män-yō'la, Italian *condottiere*: b. Carmagnola, about 1390; d. Venice, 3 May 1432. His real name was Bussone, but he adopted as his own the name of his birthplace. The son of a peasant, he was a herdsman in his youth; but enlisting in the service of the Duke of Milan (Filippo Maria

Visconti), he rapidly rose in rank, and aided his master in regaining a great part of Lombardy, and in extending his possessions. The Duke, however, became suspicious of his loyalty, confiscated his property, cast his wife and children into prison, and banished him; upon which Carmagnola entered the service of the republic of Venice, from which he received the appointment of generalissimo. He wrested Brescia from the Duke of Milan, and entirely routed his army at the battle of Macalo in 1427. After the battle he released his prisoners, which was frequently done at that time by *condottieri*, but incurring the suspicions of the Venetian senate for doing so, and his subsequent military operations not proving successful, he was recalled to Venice, under the pretext that his advice was needed for affairs of state, placed under arrest, accused of treason, put to the torture and beheaded.

Carmagnole, kär-män-yōl, a name applied in the early times of the French republic (1792–3) to a song which was accompanied by a dance. The song contained 13 couplets and the following refrain:

"Dansons la carmagnole
Vive le son, vive le son
Dansons la carmagnole,
Vive le son du canon."

The appellation originated, probably, from the name given to a peculiar form of vest worn by the confederates of Marseilles, who came to Paris in August 1792, to co-operate with the revolutionaries of the capital. The author and composer of the song are unknown. It is notable simply for its historical associations; not for the intrinsic merits of words or music. The song and dance were first used at the time of the indignation of the people on account of the veto allowed to the king on the resolves of the National Assembly. The Carmagnole was commonly sung and danced at popular festivals, executions, and eruptions of popular discontent. Afterward the name was also applied to the national guards, who wore a dress of a peculiar cut, and to the enthusiastic supporters of the Revolution. Several members of the National Convention — Barère, for instance — by way of jest, gave this name to their communications to the assembly.

Car'man, Elbert S., American editor: b. Hempstead, N. Y., 1836; d. New York, 28 Feb. 1900. He was graduated at Brown University in 1858, began contributing to the 'Turf, Field, and Farm' and similar publications early in life, and became owner and editor of the 'Rural New Yorker' in 1876. In connection with the last publication he established a farm at River Edge, N. J., where he gave much of his time to testing new plants, vines, and seeds, and also to originating new varieties of vegetables, fruits, and grains.

Carman, Ezra Ayers, American military officer: b. Metuchen, N. J., 27 Feb. 1834. He was graduated at the Western Military Institute, Kentucky, in 1855, and was assistant professor of mathematics in the University of Nashville in 1855–6. He served through the Civil War in the Army of the Potomac and the Army of the Cumberland; and attained the rank of brigadier-general of volunteers. He was comptroller of Jersey City in 1871–5; clerk in the United States Department of Agriculture in 1877–85; and a member of the Antietam Battlefield Board.

Carman, William Bliss, Canadian poet and journalist: b. Fredericton, N. B., 15 April 1861. He was educated at the universities of New Brunswick, Edinburgh, and Harvard, and has since done much journalistic work for New York and Boston papers. His verse has been widely read and his successive volumes include: 'Low Tide on Grand Pré' (1893); 'A Sea Mark' (1895); 'Behind the Arras' (1895); 'Ballads of Lost Haven' (1897); 'By the Aurelian Wall' (1897); 'Songs from Vagabondia,' joint author with R. Hovey (1894); 'More Songs from Vagabondia' (with Hovey) (1896); 'Last Songs from Vagabondia' (with Hovey) (1900); 'A Winter Holiday.' In 1903 he became editor of 'The Literary World.'

Carmarthen, kär-mär'thĕn, or **Caermarthen** (Welsh, *Caer Fyrddyn*), South Wales, a seaport town, capital of Carmarthenshire, 9 miles from Carmarthen Bay, Bristol Channel, and 14 miles northwest of Llanelly, on the right bank of the Towy. The principal buildings are the county hall, St. Peter's church, and St. David's church. Besides the established churches there are numerous places of worship belonging to other denominations. Of public and private schools the most prominent are the South Wales Training College, Sir Thomas Powell's Free Grammar School, Queen Elizabeth's Grammar School, etc. There are also two infirmaries and a literary and scientific institution. There are some tin and lead works, cloth manufactories, and iron foundries, and the salmon fishery is extensive. Pop. (1901) 9,935.

Carmarthenshire, or **Caermarthenshire,** South Wales, a maritime county, and the largest of all the Welsh counties; extreme length, 53 miles; breadth, 35 miles; area, 594,405 acres. It is mountainous generally, but not so rugged as some other Welsh counties. Some of the vales are beautiful, particularly that of Towy, which is 30 miles in length. The principal river, the Tywi or Towy, rises in Cardiganshire. This river and the Tave are the only navigable streams in the county. The valleys are fertile, and numerous herds of small black cattle are raised on the hills. The mineral products of the county are iron, lead, coal, and limestone. There are few manufactures. Pop. (1901) 135,375.

Carmaux, kär-mō, France, a city in the department of Tarn, nine miles northeast of Albi by rail. It is one of the great coal-mining centres of France, the annual output of coal sometimes reaching as much as 600,000 tons. Serious strikes and riots took place here in 1892.

Car'mel, a mountain ridge in Palestine, constituting part of Lebanon, on the southern frontier of Galilee, in the pashalic of Acca. It consists of several rich, woody heights, separated by fertile and habitable valleys within a circuit of about 28 miles, and terminates at the mouth of the Kishon in a lovely plain, which forms the southern coast of the Gulf of Ptolemais or Acca, on the Mediterranean. Upon different parts of this mountain there are ruins of churches and monasteries from the time of the Christian kingdom of Jerusalem, and the cave which, according to tradition, was inhabited by the prophet Elijah.

Car'melites, one of the four mendicant orders of the Roman Catholic Church; its full

title is Friars of Our Lady of Mount Carmel. The order has, traditionally, a very ancient origin, but as a religious order approved by the Roman Catholic Church is contemporary with the Dominican and Franciscan orders. According to the legends the Carmelites trace the origin of their order back to the early days of the kingdom of Israel, the time of the prophets Elijah (Elias) and Elisha (Elisæus). Elias, in his early manhood, says the legend, retired for religious contemplation to Mount Carmel, and there, taught by an angel, gathered to himself a number of men of like disposition, and instituted a society of contemplatives for worship of the true God and the attainment of spiritual perfection. Among the disciples attracted to this school of religion were the youths who afterward were the minor prophets Jonah, Micah, and Obadiah; and at a later period the renowned philosopher of Magna Græcia, Pythagoras, was numbered among the inquirers after the true religion and the science of divine things in this great school of the prophets: Pythagoras' instructor was the prophet Daniel. Elijah's wife instituted an order of female recluses. As pointing to the existence on Mount Carmel of some such institution as the legend postulates, reference is made to 1 Kings xviii. 19 and following; 2 Kings ii. 25; and 2 Kings iv. 25.

The world outside the precincts of those religious communities appears to have been entirely ignorant of this ancient institution till early in the 13th century, when Phocas, a Greek monk of Patmos, brought to the Latin patriarch of Constantinople intelligence of the existence in olden time of a great monastic or eremitic establishment on Mount Carmel, of which traces still remained. The site of the ancient ruins was occupied by a venerable monk from Calabria and 10 companion monks; and for these Phocas petitioned the patriarch to formulate or to approve a rule of monastic or eremitical life. This was done, and afterward the rule was approved by Pope Honorius III. in 1224. The connection of this order with the ancient school of the prophets, even if the traditional story be accepted, seems to lack proof. All that we are told which could give color to the claim that the new eremites are in the line of succession from the eminent school of prophets is, that in a vision Elias gave orders to the monk from Calabria to found a religious establishment on the ancient site. The community was expelled by the Saracens from its seat on Mount Carmel and took refuge in the west. One of the earliest houses of the Carmelite order in the west was founded at Alnwick in England; and about the same time, near the middle of the 13th century, St. Louis, the king, founded at Paris the first Carmelite house in France — the *Carmes*, of terrible celebrity in the great Revolution. Pope Innocent IV. modified the rule of the order and assimilated it to the Dominican and Franciscan rule. One of the traditions represents Jesus and his mother as initiates of the ancient order; and Saint Simon Stock, sixth general of the order, an Englishman, received from the hands of the Virgin the scapulary of Mount Carmel with the assurance that whoso should die wearing that scapulary would surely not be damned. A relaxation of the primitive severity of the rule was permitted by Eugenius IV. in 1431, and this led to a scission of the order into two suborders, the Conventuals or Calced (wearing shoes) and the Observants or Discalced (shoeless or barefooted). Pope Benedict XIII. in 1725 permitted the order to add to the statues in Saint Peter's Church of founders of religious orders, one to their founder, which was erected with the inscription: "Universus Ordo Carmelitarum Fundatori suo Sancto Eliæ prophetæ erexit" ("The whole order of the Carmelites erected this statue to their founder, Saint Elias, the prophet"). The order of Carmelite nuns dates from the middle of the 15th century. In 1562 the great mystic Saint Teresa, who was a Carmelite nun, in virtue of a papal brief established a separate branch of the sisterhood, under a very severe rule: these are the Barefoot Carmelite Nuns. She then undertook to restore in the original order of Carmelite Friars the ancient severity of discipline, and succeeded; the result is the order or suborder of the Barefoot or Discalced Carmelites. The Carmelite order, in its several forms, has establishments all over the world. The headquarters of the order in America are at Niagara Falls.

Car'men, a novel by Prosper Mérimée, published in 1847. Don José Lizzarrabengoa, Navarrese and corporal in a cavalry regiment, meets at Seville a gypsy known as Carmen. While taking her to prison for a murderous assault on another woman, he connives at her escape, and is reduced to the ranks. Jealous, he kills his lieutenant, and joins a band of smugglers. In a duel he kills Garcia, her *rom* or husband, and becomes her *rom* in turn. He offers to forget everything if she will go with him to America. She refuses, for the sake of another lover, as he believes, and he threatens to kill her. She answers that it is so ordained, but that "free Carmen has been, and free she will always be." Don José kills her, buries her body in the woods, rides to Cordova, and delivers himself to the authorities. The romance is best known in its operatic version, the adaptation having been made by Meilhac and Halévy.

Carmen Sylva, pen name of ELIZABETH, queen of Rumania (q.v.).

Carmi, Ill., a city and county-seat of White County, 150 miles southeast of Springfield, on the Little Wabash River. It is the centre of an agricultural region and exports fruit, grain, flour, tile, and lumber. It has flouring and saw mills, brick works, machine shops, etc. Pop. (1900) 2,939.

Carmichael, kär'mī-kal, **Frederic Falkiner,** Irish clergyman and author: b. 1831. He was educated privately, and entering the Anglican ministry in 1857 held several church preferments in Dublin, becoming a canon of Christ Church Cathedral, Dublin, 1886. He has published: 'Jesus Christ, the Way, the Truth, the Life'; 'Donellan Lectures' (1876); 'The Responsibilities of God'; 'All Men Shall at Length be Saved'; 'The Ghost of Samuel.'

Carmichael, Montgomery, English civil servant: b. Birkenhead, England, 17 May 1857. He was educated at Bonn and Munich and entered the English consular service in 1890. In 1892 he was appointed vice-consul at Leghorn, and he has been vice-consul for West Tuscany from 1896. He is a regular contributor to the 'Saturday Review,' and has published 'Sketches and Stories, Grave and Gay' (1896); 'In Tus-

cany,' a delightfully sympathetic description of Tuscan life (1901); 'The Lady Poverty' (1901); 'Life of John William Walshe,' a strongly conceived piece of imaginary biography (1902).

Car'minatives, remedies that cause a warm, pleasant sensation in the stomach and act as stimulants to the muscles, causing peristalsis, thus relieving flatus; and that increase the flow of the gastric and intestinal secretions. Most of the drugs containing volatile oils are carminatives; as, the mint family, parsley, anise, fennel, caraway, cardamom, ginger, cinnamon, cloves, etc. See VOLATILE OILS.

Car'mine, the most splendid of all the red colors, is made from the cochineal insect, or *Coccus cacti.* The finest is that which is thrown down from an aqueous infusion by chloride of tin. This, after depositing, is collected and dried. The operations require the greatest care, for the brilliancy of the color is affected by the weather, light, and temperature. The color produced by alum has a darker tint, and constitutes lake. Carmine, or carminic acid, is also the name given by chemists to the coloring matter of cochineal. The acid is a purplish body, extremely soluble in water and in alcohol. It forms salts with the heavy metals, and it yields various products when acted on by chlorine, nitric acid, and other re-agents. Carmine is used to some extent in dyeing, in water-color painting, to color artificial flowers, confectionery, etc.

Carmo'na (ancient CARMO), a town in Spain, 20 miles from Seville, on a height overlooking a large plain covered with olive-trees. It is well built, containing many handsome mansions belonging to the nobility, who, though usually resident in Seville, spend part of the year here. The principal square is well planted, and, among other edifices, possesses a handsome Gothic church with a lofty spire. Another conspicuous object is a Moorish castle, flanked with massive towers, and there are two old Roman gates. The manufactures are chiefly woolen hats, leather, and earthenware. Recent important excavations on the site of the ancient necropolis, to the west of the modern town, have brought to light a large number of tombs and funeral triclinia in almost perfect preservation. Considerable portions of the Moorish wall and Alcazar still remain. Pop. (1903) 18,000.

Carmontel, kär-môn-tĕl, or **Carmontelle, Louis Carrogis,** loo-ē kär-rō-zhē, French poet: b. Paris, 15 Aug. 1717; d. there, 26 Dec. 1806. He is best known by his 'Proverbes Dramatiques' (10 vols.). These are without much connection in themselves, being, in fact, only a series of dramatic scenes, but are well adapted for private theatres. The fertility of Carmontel was as extraordinary as his ease in writing. He is said to have left, besides his printed works and his pieces for the theatre, more than a hundred volumes of manuscripts.

Carnac, kär-nak, France, a village in the department of Morbihan, on a height near the coast, 15 miles southeast of Lorient, and remarkable for the so-called Druidical monuments in its vicinity. These consist of more than 1,100 rude blocks of gray granite, some of which are upward of 18 feet high, standing on end in the midst of a wide heath. They are in the form of unpolished obelisks, with the vertex reversed, and are arranged in 11 lines, forming 10 avenues, with a curved row at one end. There are many gaps in the lines; almost every house and wall in the vicinity is seemingly built from this artificial quarry. They are evidently of very ancient date, but their origin is unknown. Pop. (1891) 2,901. See Lukis, 'Chambered Barrows and Other Historic Monuments in Morbihan' (1875); Miln, 'Excavations at Carnac' (1877–81).

Carnahuba. See CARNAUBA.

Car'nall, Rudolph von, German mining engineer: b. Glatz, 1804; d. 1874. He began the study of mining in Berlin in 1823, was connected with the mining industry in Upper Silesia and rose to be superintendent of mines and director of the general mining office in Breslau. He took part in founding the German Geological Society, lectured at the University of Berlin on the science of mining engineering, and rendered important service to the development of German mining.

Car'nallite, a hydrous chloride of potassium and magnesium, found at Stassfurt, Prussia, and of great commercial importance as being one of the minerals from which come the world's supply of potash salts. See POTASSIUM.

Carnarvon, kär när'vŏn, **Henry Howard Molyneux** (4th EARL OF), English statesman: b. London, 24 June 1831; d. 28 June 1890. He succeeded his father in the earldom in 1849, and was secretary of state for the colonies, June 1866 to March 1867. During his secretaryship he devised a scheme for the federation of the British North American Colonies, subsequently approved by Parliament. He was again colonial secretary, 1874–8, and lord-lieutenant of Ireland, 1885–6. He published 'The Druses of Mount Lebanon' (1860).

Carnarvon, or **Caernarvon,** Wales, a seaport town and parliamentary borough, on the southeast side of the Menai Strait, and capital of the county, 209 miles northwest of London. The ancient walls thrown around it by Edward I., and flanked by round towers, are still fairly entire. The magnificent castle or palace of Edward I., and in which Edward II. was born, stands at the west end of the town, almost overhanging the sea, and is externally entire. Including its court-yards, etc., it covers about two acres of ground. There are extensive ironworks in the town, which supply machinery for steamers, etc. Pop. (1901) 9,760.

Carnar'vonshire, or **Caernarvonshire,** Wales, a maritime county having Carnarvon Bay on the west; Denbigh on the east; the island of Anglesea and the Irish Sea on the north; and Cardigan Bay on the south. Its extreme length, southwest to northeast, is about 52 miles; extreme breadth, 20 miles, although the greater portion of it does not exceed seven or eight miles on an average; area, 369,477 acres. This county is traversed throughout its whole length by lofty mountains, including the Snowdon range, whose highest peak is 3,557 feet above the sea. There are other summits varying from 1,500 feet to more than 3,000 feet. Dairy farming, and cattle, horse, and sheep breeding are the principal occupations of the farmer. The cattle and sheep are of a small breed. Lead and copper ores are found in the mountains south, and there are slate quarries at Bethesda,

CARNATION

Mau

Llanberis, and Nantlle, which have been extensively and profitably worked. Pop. (1901) 126,835.

Carnatic, kär-năt'ĭc, former province of British India, on the east coast of the peninsula. Its limits were ill defined, but it is commonly thought to have extended from Cape Comorin to lat. 16° N., and from the coast line to an average of about 80 miles inland. It was formerly included in the dominions of the nabob of Arcot, and the contentions arising from a disputed succession first brought the French and English into collision, and ended by the subjugation of the Carnatic under the British influence, which was completely effected in 1801. The Carnatic as one of the wealthy provinces has been the cause of endless native warfare and bloodshed, by which, whoever was victor, the unhappy cultivator suffered in the end; as each successive ruler, feeling his tenure uncertain, cared only to make revenue while the power lasted, an example which was but too closely imitated by his unscrupulous ministers and officials. The Carnatic is now included within the administration of the presidency of Madras.

Carnation, a half-hardy perennial herb (*Dianthus caryophyllus*) of the natural order *Caryophyllaceæ,* a native of southern Europe. It has more or less erect stems with enlarged joints, linear opposite leaves covered with a bloom, and solitary, variously colored terminal perfumed flowers, which naturally appear during summer, but which are produced artificially by certain varieties throughout the year. The plant has been in cultivation for its flowers for more than 2,000 years, but not until the early years of the 16th century did its flowers become greatly differentiated from their original flesh tint, which suggested the popular name (Latin *carnatio*). So numerous became the varieties that systems of classification were adopted. The popular European system of to-day is: (1) "Selfs," flowers of one color; (2) flakes, flowers with yellow or white ground and striped with either rose, scarlet, or purple; (3) "bizarres," resembling flakes except that they are striped with more than one color; (4) "picotees," with white or yellow petals margined with red, etc. The summer-blooming carnations which suggested this classification are little grown in America, but are very popular in Europe. They seem to demand a moist, cool climate. The group most cultivated in America and known as perpetual-flowering tree, or monthly carnations, originated in France about 1840 as the result of crossing and selection. The first of these varieties imported into America is said to have arrived in 1868, since when the growing of carnations under glass as a crop has developed. The extent of the industry is very great and is steadily growing. According to the census report of 1900 the value of the carnation crop in 1899 was about $4,000,000, produced in about 9,000 American commercial greenhouses.

Propagation of the monthly carnations is usually effected by means of cuttings of young stems. When well rooted they are potted in good soil and kept until late spring, when they are transplated to the open ground or to the benches where they are to blossom. A winter temperature ranging between 50 and 55° at night and preferably only 10° higher during the day, is desirable. At the end of the winter they are thrown away.

The most common insect pests of the carnation are the red spider and the green aphis. The red spider thrives best in dry atmosphere, and is most easily controlled by syringing with water and evaporating (not burning) sulphur in the greenhouse once a week for about five weeks, when the insects become troublesome. The green fly or green aphis seems to thrive under any ordinary conditions. It is usually fought with tobacco fumes or various extracts of tobacco. Three fungous diseases are often troublesome: Rust (*Uromyces caryophyllinus*), spot, or blight (*Septoria dianthi*), and anthracnose (*Volutella sp*). These are largely prevented by judicious management, and when they occur may be controlled by destroying diseased plants and by spraying with Bordeaux mixture (see FUNGICIDE). Rust appears on the stems and leaves as blisters which break and expose brown spores. Spot consists of brown dots with black centres where the spores are borne. Anthracnose is characterized by grayish-brown spots. (Bailey, 'Cyclopædia of American Horticulture,' New York 1900–1902). Thirty-seven acres of land are devoted to the raising of carnations at a nursery in Los Angeles, California. Nine greenhouses, each 200 feet long and 15 feet wide, together holding 35 tons of glass, are used to raise the young plants.

Carna'tion (Latin, *caro, carnis,* "flesh"), in the fine arts, the coloring of the skin of the human body. The use of carnation requires very attentive study and great skill in the artist. It varies with the sex of the individual, with the classes and countries to which the subjects belong, with the passions, the state of the health, etc. The cheeks are, in a healthy subject, of a lively red; the breast, neck, and upper part of the arms of a soft white; the belly yellowish. At the extremities the color becomes colder, and at the joints assumes a violet tint, on account of the transparency of the skin. All these shades require to be softly blended. Two faults in carnation are chiefly to be avoided,— hardness, the fault of the masters of the 15th century, and too great weakness. Guido Reni not infrequently painted his flesh so that it appeared almost bloodless. The French school has gone farthest in this respect. The flesh of the followers of this school often looks like porcelain or wax. Titian and Rubens are unrivaled in carnation.

Carnauba, kär-nä-oo'bạ, the Brazilian name of the palm, *Copernica cerifera,* which has its leaves coated with waxy scales (whence the name wax-palm), yielding a useful wax by boiling. The fruit and pith are eaten, the leaves are variously employed, and the wood is used in building.

Carne'ades, Greek philosopher: b. Cyrene, Africa, 213 B.C.; d. 123 B.C. He studied first under Diogenes the Stoic, but subsequently attended the lectures of Egesinus, who explained the doctrines of Arcesilaus; and succeeding his master in the chair of the academy, he restored its reputation by softening the prevailing pyrrhonism and admitting practical probabilities. The doctrine of Carneades specifically was, that "as the senses, the understanding, and the imagination frequently deceive us, they cannot be the infallible judges of truth, but that from the im-

pression made by the senses we infer appearances of truth, which, with respect to the conduct of life, are a sufficient guide.» He was a strenuous opposer of Chrysippus, and attacked with great vigor the system of theology of the Stoics. He was an advocate of free-will against the fate of the same sect, and urged just the same difficulties in reconciling divine prescience with the freedom of human actions as have divided some contending sects of Christianity. One of the most distinguished events of his life was his being joined in an embassy to Rome wth Diogenes the Stoic and Critolaus the Peripatetic, in order to gain the mitigation of a fine levied by the Roman senate on the Athenians. This extraordinary embassy was successful, and Carneades so captivated the people by his eloquence, one day delivering a harangue in praise of justice, and on the next proving it to be an odious institution, that Cato the censor, fearful of its effect on the Roman youth, persuaded the senate to send the philosophers back to their schools without delay. In his latter years Carneades became totally blind; he died in his 90th year, continually complaining of the shortness of life, and lamenting that the same nature which composed the human frame could dissolve it.

Carnegie, Andrew, American iron-master, manufacturer and philanthropist: b. Dunfermline, Scotland, 25 Nov. 1837. None even of the mighty makers of their own fortunes began closer to absolute zero; certainly none who have owed success not to fortunate speculations, but to steady labor, sagacity, and self-culture, the natural working of the highest powers on opportunities open to all and less to him than to most. His father owned a small hand-loom business, which was closed in 1848 by the competition of steam. He then emigrated to the United States and settled in Allegheny City, Pa. The 10-year-old child here became a bobbin-boy at 20 cents a day; his alertness in a few months brought him transference to an engine-room, his penmanship and arithmetic a chance to do clerical work. Next a telegraph messenger boy at Pittsburg (with a mother and younger brother to support from his slender wages), he promptly mastered telegraphy, was soon given a place as operator, and won himself extra earnings and experience in composition as a newspaper telegraph reporter. Superior fitness brought him the post of telegraphic train-despatcher to the Pennsylvania R.R.; then of secretary to its general superintendent, Col. Scott; and in 1860, when his chief became vice-president, Mr. Carnegie was made superintendent of the Western Division. Meantime his business fortune had opened with the tentative adoption by the road, through his agency, of the Woodruff sleeping-car system, in which he shrewdly embarked some borrowed money; his expert knowledge made it investment, not speculation; and his dividends went partially into oil lands around Oil City, selected with equal judgment. At the outbreak of the war, Col. Scott was made assistant secretary of war, and gave Mr. Carnegie charge of the eastern military railroads and telegraph lines, and of this department there was no complaint or scandal, and no breakdown except of Mr. Carnegie's health from overwork. He was also the third man wounded on the Union side, while removing obstructions from the Washington tracks.

Already a small capitalist, in 1862 the Pennsylvania road's experiments in replacing wooden with iron bridges led him to forecast the future monopoly of the latter, and organize the Keystone Bridge Works, which built the first iron bridge across the Ohio. To increase their profit by furnishing their own iron, he entered the field which has made him one of the industrial sovereigns of all time. The first step was the erection of the Union Iron Mills, furnaces and rolling mills; the last, after inspection of the Bessemer process in England, to establish it in this country in 1868. The story since is one of swift aggregation of plant on plant, till they have dominated their class, and become one of the chief industrial factors of the entire business world in this its greatest age. By 1888 he had acquired a controlling interest in his foremost rival, the Homestead Steel Works, and in seven other immense establishments centred around Pittsburg; in 1899 he consolidated all these into one giant structure, the Carnegie Steel Company; and in 1901 he retired from business life, transferring his company at a valuation of $500,000,000 to be merged into one still vaster, the United States Steel Corporation, formed by J. Pierpont Morgan. His United States residence is in New York; his summer establishment at Skibo Castle, in the extreme north of Scotland.

Such supreme success, fairly won in a struggle with the world, is of course the result of a supreme individual genius not to be taught or explained; but as the amount of work any one man can do unassisted is a trifle, the chief instrumentality is always the faculty of organization. Mr. Carnegie himself once said that the organization *was* the business; that if striped at a blow of all his material property and business connections, but left his organization, in four years he would have re-established himself. But the organization is simply the men who work it, with their capacity of selecting capable subordinates, and understanding public needs and the means of supplying them; and this leaves the faculty of creating and sustaining it no nearer solution than before. In the last analysis it means a nicely accurate judgment of *men,* resulting from an intuitive gift informed and tested by long experience; and as men are not pawns, it implies the power of persuading them into and keeping them in alliance as well.

Always a generous and helpful man, he had definitely begun, a few years before his retirement, a new existence consecrated to public service, and to which he will owe enduring remembrance. Another generation would have forgotten the mere business man, however great; for after all it would have had steel from some source, if perhaps less cheaply; but it could not have had from lesser men, and would not have had from any, the splendid, judicious, and permanently useful gifts with which he has endowed it, and which no change of social ideals can render obsolete or harmful. No one has ever so royally returned to the public what he had (to its own benefit) drawn from the public. This is his own expressed conviction of duty; that «surplus wealth is a sacred trust to be administered for the highest good of the people,» and that sometime «the man who dies possessed of millions free and ready to be distributed, will die disgraced.» But he is equally

Μηδ

emphatic in declaring that indiscriminate giving is mostly sheer mischief, and that no person and no community can be permanently helped except by their own co-operation. Therefore, every gift of his to a community is conditioned on the latter supporting it; and all those to institutions are thought out, and so bestowed that they forward the work without impairing the springs of public interest, or the ties to the public, which must after all be their permanent stay. These gifts are mostly not to charities in the current sense, relief of material distresses, for which the spirit of human brotherhood should be adequate; but for that mental and spiritual cultivation which should raise communities out of the lowest plane of social evils. An apparent exception, which, however, is not charity but justice and business sense, is the endowment of $4,000,000 given for an annuity fund to the workers at Homestead. The remainder of his benefactions may be divided broadly into institutions for research and the discovery of fertile new ideas; those for teaching the best of ideas and their practical appliances already known; and those for storing the results of knowledge and creation and distributing them to the public — in a word, universities, colleges, and technical schools, and libraries. Even the organs he has presented to several hundred churches may be classed in this category; as he genially observed, he is willing to indorse unreservedly all the utterances of the organs, but not of the preachers. The total amount of his benefactions to date is upward of $70,000,000, of which some $55,000,000 has been given in the United States, and with much more ultimately assured. The greatest single foundation will be the Carnegie Institute at Pittsburg, an enormous technological school, with library, art gallery, and every imaginable accessory,— the people's college of what he thinks the coming type,— which has received $10,000,000 already and is promised $25,000,000 in all. Next is the Carnegie Institution (q.v.) at Washington, to promote original research and enable original workers to use their whole time for study, experiment, and creation; perhaps his most valuable benefaction ultimately, since new ideas are at once the scarcest and the most valuable items of the world's income, and the work of one great man outweighs that of 10 generations of small ones. Of the others, perhaps the most useful, considering the work, and the chief, is the gift of $600,000 to the Tuskegee Normal and Industrial Institute in Alabama, conditioned on the trustees using enough of its income annually to free Booker T. Washington, its head, from money cares and the need of "drumming" support for his college the rest of his life, and enable him to devote his whole time to this noble institution. Sixty-five libraries in New York have received $5,200,000; one in St. Louis $1,000,000, and two in Detroit and San Francisco $750,000 each; libraries at Homestead, Braddock, and Duquesne $1,000,000; and the universities in his native Scotland $10,000,000.

Mr. Carnegie has also won fame as an author, in addition to his other distinctions; and the public appreciation has been evinced in the emphatic and unfeigned form of a large unaided sale. His first works, 'Notes of a Trip Around the World' (1879) and 'Our Coaching Trip' (1882), were printed first for private circulation, but published in consequence of the great pressure for private copies. 'An American Four-in-Hand in Britain' (1883) and 'Round the World' (1884) followed; but his greatest success was attained with 'Triumphant Democracy' (1886), which sold 40,000 copies within two years. 'The Gospel of Wealth' (1900) and 'The Empire of Business' (1902) have maintained his reputation as a clear, forcible, and interesting writer.

Carnegie Institution, an educational body incorporated 4 Jan. 1902, in Washington, D. C., by John Hay, secretary of State; Edwin D. White, justice of the supreme court; Daniel C. Gilman, ex-president of Johns Hopkins University; Charles D. Walcott, superintendent of the United States Geological Survey; Dr. John S. Billings, director of the New York Public Library; and Carroll D. Wright, United States commissioner of labor. The aims of the university as expressed by the founder are: (1) To increase the efficiency of the universities and other institutions of learning throughout the country by utilizing and adding to their existing facilities, and by aiding teachers in the various institutions for the experimental and other work in these institutions as far as may be advisable; (2) to discover the exceptional man in every department of study, whenever and wherever found to enable him by financial aid to make the work for which he seems especially designed his life work; (3) to promote original research, paying great attention thereto as being one of the chief purposes of this institution; (4) to increase the facilities for higher education; (5) to enable such students as may find Washington the best point for their special studies to avail themselves of such advantages as may be open to them in the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools and kindred institutions of the several departments of the government; (6) to insure the prompt publication and distribution of the results of scientific investigation, a field considered to be highly important.

The board of trustees elected by the corporators of the institution was as follows: The President of the United States (ex-officio), the president of the United States Senate, the speaker of the House of Representatives, the secretary of the Smithsonian Institution, the president of the National Academy of Sciences, and Grover Cleveland (New Jersey), John S. Billings (New York), William N. Frew (Pennsylvania), Lyman J. Gage (Illinois), Daniel C. Gilman (Maryland), John Hay (District of Columbia), Abram S. Hewitt (New Jersey), Henry L. Higginson (Massachusetts), Henry Hitchcock (Missouri), Charles L. Hutchinson (Illinois), William Lindsay (Kentucky), Seth Low (New York), Wayne McVeagh (Pennsylvania), D. O. Mills (California), S. Weir Mitchell (Pennsylvania), W. W. Morrow (California), Elihu Root (New York), John C. Spooner (Wisconsin), Andrew D. White (New York), Edward D. White (Louisiana), Charles D. Walcott (District of Columbia), and Carroll D. Wright (District of Columbia).

The trustees assembled in Washington on 29 Jan. 1902, received from Mr. Carnegie the deed of gift of $10,000,000, and elected Daniel C. Gilman, LL.D., president of the institution.

Carne'ia, a national festival of the ancient Spartans celebrated in honor of Apollo, and in

the Spartan month Carneios. The festival lasted nine days, during which the Spartans were not allowed to enter upon a hostile campaign.

Carnelian, a beautiful, translucent chalcedony (q.v.), usually of rich brownish-red color, though sometimes brown or more rarely yellow. Some of the finest Greek and Roman intaglios and seal rings are of carnelian or sard, which is a brownish-red or dark-brown carnelian. Sardonyx (q.v.) or sard with a white top, is cut into beautiful cameos. Fine carnelians come from Nova Scotia, Brazil, Uruguay, Arabia, and India. Cambay, in Hindustan, is a noted market for the Indian stones. The native jewelers, like the lapidaries of Idar (see AGATE), intensify the colors by baking the stones in the sun for several weeks and then in ovens.

Carneri, Bartholomäus von, bär-tō-lō mä'oos fōn kär-nā'rē, Austrian poet and politician: b. Trent 1821. His volume of poems 'Plough and Sword' was greatly admired. He has published 'Foundation of Ethic' (1881); 'Der Moderne Mensch' (1900); etc.

Car'nifax Ferry, W. Va., place at which occurred a battle of the Civil War, 10 Sept 1861. On 23 August Gen. John B. Floyd, who had marched from Lewisburg, crossed to the north side of Gauley River at Carnifax Ferry with five regiments of Virginia infantry, 100 cavalry, and five guns, aggregating about 2,600 men. The 7th Ohio had been guarding the ferry, but had been recalled to within six miles of Gauley Bridge, and then ordered to return to Cross Lanes, two miles from Floyd's position, which it reached in the night of the 25th. Early on the morning of the 26th Floyd advanced, surprised the regiment while at breakfast, and routed it, killing and wounding 45 and capturing 96. About 200 men escaped to Gauley Bridge and about 400 were collected and led by Major Casement to Charleston on the Kanawha. Floyd's intention in crossing the Gauley was to force the retreat of Gen. J. D. Cox from Gauley Bridge down the Kanawha Valley, whither he proposed to follow him and make a raid of 50 miles into Ohio, but Gen. H. A. Wise, who commanded one of his two brigades, had refused to obey his order to cross the Gauley, upon which Floyd abandoned his idea of invading Ohio, and intrenched his position in a bend of the Gauley, both flanks resting on the precipices rising abruptly from the river. The presence of Floyd north of the Gauley gave Gen. Rosecrans some uneasiness, and turned his attention from the Cheat Mountain region where he had been confronting Gen. R. E. Lee. Leaving Gen. J. J. Reynolds to oppose Lee, he drew troops from posts in the rear and assembled at Bulltown seven and a half regiments of Ohio infantry, two batteries of artillery and three companies of cavalry, which were formed into three brigades, commanded by Gen. H. W. Benham, and Colonels E. P. Scammon and R. L. McCook. On 9 September he marched from Bulltown, crossed Big Birch Mountain, drove the 36th Virginia and a company of cavalry from Summersville, on the morning of the 10th, and followed to Cross Lanes, which he reached at 2 P.M., and heard that Floyd was intrenched about two miles distant. Benham, commanding the leading brigade, was ordered to advance cautiously and feel Floyd closely, but not to engage him until the entire column came up, unless he saw a good opening. Benham drove in Floyd's pickets, and believing that he was in full retreat, pushed rashly forward in the face of a severe artillery fire, becoming closely engaged and making some spirited charges upon Floyd's works, which were repulsed. He then called for help. Rosecrans hastened up the brigades of Scammon and McCook, and going to the front, was surprised that the reconnoissance ordered had developed into a severe and badly conducted engagement. It was too late to withdraw without giving the appearance of defeat; other efforts were made, in which Scammon and McCook participated; but it was growing dark, the men were exhausted after their march of 17 miles, and Rosecrans withdrew, intending to renew the fight in the morning. During the night Floyd recrossed the Gauley, destroyed the foot-bridge behind him, sunk the ferry-boat and, with Wise, retreated to Sewell Mountain. The Union troops, fully exposed and not well handled, had 17 killed and 141 wounded. The Confederates, well protected by log-works, had none killed and 21 wounded. Consult Official Records, Vol. V.

E. A. CARMAN.

Carnio'la (German, KRAIN), a province of Austria, with an area of 3,856 English square miles. It is covered with lofty mountains, some of which are about 10,000 feet high, and, generally speaking, is one of the most unfertile regions of the empire. Some districts, however, produce considerable quantities of wheat, barley, wine, and, in the south, fruits of various kinds, and excellent flax. There are some iron, lead, and quicksilver mines, the latter exceedingly rich. It abounds in clays and valuable stones, and in coal and marble. There are considerable manufactures of iron, fine linen, lace, woolen cloth, flannel, worsted stockings, leather, wooden articles, etc. Its chief exports are steelwares, quicksilver, hats, linens, glasswares, wax, wine, flour, etc.; principal imports — salt, oil, fruit, coffee, sugar, tobacco, cloths, cattle, etc. Carniola was made a duchy in the 12th century, under the dominion of the Counts of Tyrol, who became extinct in 1335, and were succeeded by the Earls of Goerz. After the treaty of Vienna, in 1809, it was ceded to France, and incorporated in the kingdom of Illyria. In 1814 it came again into the possession of Austria. Capital, Laibach. Pop. (1900) 508,348.

Car'nival. The same views which led men to propitiate the higher invisible powers by gifts, sacrifices, and purifications, also introduced fasts, abstinence from pleasure, and penances. By fast is meant an abstinence from the usual means of nourishment, in order to mortify the appetites, and thereby to propitiate the Deity. In every nation of importance customs of this kind are found. Their historical origin is in the religious customs of the East, where the priests were originally the physicians of the people, and prescribed these fasts as a part of the regimen necessary in this warm region, as well as from religious views. Fasts are observed to this day in the East. The religions of the Persians and the Hindus, those of the Mohammedans, and of the worshippers of the Lama, insist much on fasts. Few traces of them are found in the religion of the ancient people of the North. The earliest Christians fasted on the vigils (q.v).

The fasts on the *jejunia quatuor tempestatum,* which continued for three days every quarter of the year, were penances, as was that of the period of 40 days (before Easter, or rather before Good Friday, *Quadrigesimæ*), which was called, by way of excellence, the fast, and which commemorated the 40 days' fast of Jesus in the wilderness. With regard to the origin of Christian fasts, opinions differ. The most common is, that Telesphorus, bishop of Rome, in the middle of the second century, first instituted the 40 days' fast as a rule of the Church. By Pope Gregory the Great, about 600, Ash Wednesday was made the beginning of the fast, and the day before was called fast eve, because in the night of this day, at twelve o'clock, the fast began. This fast was preceded by a feast of three days, very obnoxious to the strict zealots. "Christians," it is said, "on these days deliver themselves up to voluntary madness, put on masks, exchange sexes, clothe themselves like spectres, give themselves up to Bacchus and Venus, and consider all pleasure allowable." This is the origin of the present carnival, or *Fasching,* as it is called in the south of Germany, and which continues in that country from Twelfth Day to Ash Wednesday. The name carnival is derived from the Latin *caro, carnis,* flesh, and *vale,* farewell (according to Ducange, from the Latin denomination of the feasts in the Middle Ages, *carnis levamen,* solace of the flesh), because at that time people took leave of flesh. Previously to the commencement of their long abstinence, men devoted themselves to enjoyment, particularly during the last three days of the carnival. The carnival is nothing but the Saturnalia of the Christian Romans, who could not forget their pagan festivals. At least it greatly resembles the Saturnalia which were celebrated annually in December, with all kinds of mirth, pleasure, and freedom, in honor of Saturn, and the golden age when he governed the world, and to preserve the remembrance of the liberty and equality of man in the youth of the world. In Rome, the carnival brought to view, in a lively manner, the old Saturnalia in a new form. During the last days of the carnival, and particularly during the day which preceded the long fast, mummeries, plays, tricks, and freedom of every kind, abounded. From Italy, the modern Saturnalia passed to the other Christian countries of Europe. The wealthiest class commenced their amusements 8 or 10 days before Ash Wednesday, the middle classes 2 or 3 days, the poor only observed one day (the *Fastnacht* of the Germans). In the amusements of this period the dramatic poetry of Germany had its origin, after the cities had attained a flourishing condition. Its first traces appeared in the 13th century. The mummeries of the carnival produced the idea of adopting some character, and carrying it through. To please the multitude, and make the laugh more certain, the manners of common life were caricatured. These exhibitions afterward became more cultivated and developed. On fast eve persons in disguise sometimes went from one house to another, to make sport with their friends and acquaintances. A merry society of this kind formed a plan to represent some scene in their disguises, and hold a regular conversation at one of these mummeries. The unknown players received praises, entertainments, or presents. Encouraged by this success, the company grew stronger, their fables and speeches became longer by degrees, until they attained to regular representations of human life. It was in Nüremberg, renowned for its wares and its wit, that the first fast eve's play was produced, coarse and frolicsome, to suit the taste of the citizens. The earliest of these pieces that have come down to us date from 1450–70; they have a near relationship to the masques of the English and the farces of the French, as have the spiritual fast eve's plays, religious burlesques, to the Mysteries and Moralities. In Italy the carnival is now celebrated with the greatest show and spirit at Rome. It lasts for the 10 days preceding Ash Wednesday, certain observances taking place on certain days. Some days, for instance, are devoted to the throwing of comfits, or of small plaster pellets that take their place, these being flung from the balconies of the houses upon the persons in the streets — especially in the Corso — who retaliate in the same way, and in order that they may do this many of them are mounted upon lofty cars or other vehicles, all being masked. On other days the finest equipages move along in procession, and flowers instead of comfits are thrown. Races of riderless horses in the Corso are another prominent feature of carnival time. After sunset on Shrove Tuesday everybody carries a lighted taper (these being known as *moccoletti*), and each tries to extinguish as many others as he can while keeping his own alight. Venice, Turin, Milan, Naples, Florence, etc., also celebrate the carnival with more or less ceremony, and the same can be said of various towns of the south of France, Nice in particular. The carnival at Rome has been excellently described by Goethe. In Germany the carnival is celebrated with brilliancy only in the Catholic cities of the Rhine valley, Mayence, Bonn, but above all Cologne. In Protestant countries, generally, the feast is not observed to any extent.

Carniv'ora, broadly, those animals which prey upon other animals; but in a restricted sense, that order of mammals to which the cat, dog, bear, and seal belong. The head is small in proportion to the bulk of the body, and the skin is well covered with hair. The limbs, four in number, are fully developed, and are adapted either for walking or swimming. Two sets of teeth, deciduous or milk and permanent, are always developed in succession, and in both sets incisors, canines, and molars, are distinguishable. The order is divided into two groups, the *Fissipedia,* which include such animals as the lion, wolf, bear, etc., whose life is terrestrial; and the *Pinnipedia,* or those which are specially adapted for aquatic life.

1. *Fissipedia.*— All the carnivores of this division, except the sea-otter (*Enhydra*), have six incisor teeth in each jaw, the canine teeth are prominent, and one of the molar series in each jaw is usually compressed laterally, so as to present a cutting edge. The toes are furnished with claws, and the anterior limbs are used for seizing and holding prey as well as for walking. The skull is contracted behind the orbits, so as to give an hour-glass form when seen from above. The hollow formed by this constriction on each side of the head is bridged over by the wide zygomatic arch, and thus gives room for the powerful muscles of mastication. The lower jaw is articulated to the skull, so that it can only be moved up and down. The incisor

and canine teeth are represented by the formula $i\frac{3-3}{3-3}, c\frac{1-1}{1-1}$. The teeth behind the canines increase in size from before backwards, and vary from $\frac{4-4}{3-3}$ in the cat, to $\frac{5-5}{5-5}$ in the South African otocyon, the total number of teeth of all kinds ranging from 30 to 48. The posterior teeth are divided into premolars and molars; the last of the premolar series in the upper, and the first of the molar series in the lower jaw presenting the lateral compression and trenchant margin which earns for them the name of sectorial or carnassial teeth. Behind the carnassial the molars have tuberculated crowns. The stomach is simple and undivided, and, as a general rule, is more rounded in the flesh-eating genera. The limbs terminate in digits, which are never fewer than four, and are furnished with sharp claws, which in the *Felidæ* are retractile within sheaths of the integument on the dorsal surface of the toes. In walking, the extremities of the toes are applied to the ground, as in the "digitigrade" cat and dog; or the whole sole of the foot is put down, as in the "plantigrade" bear. The six families included under the fissipede carnivores are: (1) *Felidæ:* lion, tiger, leopard, cat, etc. These present the highest type of the carnivorous structure. The claws are retractile. (2) *Canidæ:* wolf, dog, jackal, fox, etc. The claws are not retractile, and the gape is longer. The toes in this and the previous family are five on the anterior and four on the posterior extremities; (3) *Hyænidæ:* hyæna, aardwolf, etc. The hyænas have the anterior limbs longer than the posterior, and both terminate in four toes. The skull and dentition approximate to those of the Felidæ; (4) *Viverridæ.* The supple elongated bodies of these animals are intermediate between those of the cats and the martens. Some, as the civet, gennet, zibet, have the claws retractile; in others, as the ichneumon and rasse, they are not retractile. Those mentioned are digitigrade, but the suricate of central Africa is plantigrade. In this family glands are found under the tail, the secretions of which have powerful odors. The diet of this family is not purely animal. (5) *Mustelidæ.* The members of this family have elongated bodies with short limbs, terminating usually in five-toed feet with retractile or non-retractile claws. The marten, weasel, polecat, ermine, glutton, or wolverene, constitute one sub-family of exclusively terrestrial life. The badgers, the skunks, and the like, constitute another division. (6) *Ursidæ.* In this family the carnassial tooth is no longer trenchant, but tuberculated. All are plantigrade, but the habits and aspect vary considerably, and include, besides the bears, the raccoons, panda, and several lesser forms. The raccoon and its allies are sometimes made a family with the name *Procyonidæ.*

2. *Pinnipedia.*— The aquatic carnivores comprise three families, represented by the walrus or sea-horse, the eared seals, and the common seals. They are related to the preceding families through the otters and the bears, and agree in having the extremities modified into swimming organs or flippers, and the teeth more uniform in character. See SEAL; WALRUS.

Carnivora, Fossil. The evolution of the *Carnivora* through the Tertiary Period is shown by numerous fossil species. These indicate that the modern carnivores are descended from a group of primitive *Carnivora* (see CREODONTA) of the early Eocene, and have gradually diverged from a single stock, of which the *Viverridæ*, or civets, are the nearest living representatives. From these the dogs branched out in one direction, the mustelines, hyænas, and cats in others, while the bears and raccoons are offshoots of primitive dogs. Many intermediate stages are known, between dogs and bears (as *Amphicyon, Hyænarctos*), dogs and raccoons (*Phlaocyon*), mustelines and civets (*Plesictis*, etc.), civets and hyænas (*Ictitherium*). No true *Carnivora* are found fossil in South America until the end of the Tertiary, and (with a single exception) none exist now in Australia. In both continents their place was supplied by carnivorous marsupials (see MARSUPIALS, FOSSIL), which branched out into groups more or less paralleling the true *Carnivora* of the northern hemisphere. See also BEARS; CATS; DOGS; FOSSIL.

Carnivorous Plants, plants of various genera which subsist partly upon insects and other small animals which they entrap in various ways. The apparatus in each case is a modified leaf or part of a leaf, and in some cases the modifications are so curious, so well adapted to the use to which they are put, and so perfect in action, that the plants seem almost intelligent. The object sought by these plants seems to be to supply themselves with nitrogenous food, which is generally in meagre supply where they usually live — undrained swamps. Probably, too, such plants as do not live in these habitats formerly did, but have not yet lost the use of the apparatus. A case of this kind is exhibited by the genus *Utricularia* (see BLADDERWORT). In this genus various species provided with active bladders, which act like eel-traps, live submerged in ponds; other species, also possessing active but less perfect and useful traps, live in the marshy soil of swamps. Still others live on dry ground, but these have usually abortive traps. The conclusion is that as the ponds became swamps, and the swamps were converted into dry land, the supply of nitrogenous food increased, and hence the traps became aborted, because they were no longer needed.

Probably the most nearly intelligent of these carnivorous plants is the Venus' fly-trap (*Dionæa*), found in the southeastern United States. The trap consists of two pieces hinged together. On the margins are bristles, and in the interior a few sensitive hairs, which, when touched, act like a trigger, and the apparatus closes. Should an insect cause this action the bristles will prevent its escape and the trap will remain closed until its digestion is complete, when the trap will open, cast out the indigestible portions, and be ready for another victim. If the trap fails to catch its prey, or if it be sprung by something it cannot utilize, it will open again in a short time. In the sundew (*Drosera*) the leaves are provided with glandular hairs which close over the insect that alights upon the leaf, and a glistening sticky substance holds it fast until its digestible parts are absorbed by the plant.

In the pitcher-plants (*Sarracenia, Nepenthes*, etc.), the pitcher consists of a tube either with or without a lid or hood. Around the mouth there is usually a sugary secretion which acts as a lure. The insect that alights cannot escape

because the tube is lined with hairs that force him downward to the bottom of the tube, which is usually partly filled with water. Some other genera in which the carnivorous habit is developed are *Darlingtonia, Aldrovandra,* and *Pinguicula.* Consult: Darwin, 'Insectivorous Plants.'

Carnochan, kär'nō-kăn, **John Murray,** American surgeon, famous for his bold and skilful operations: b. Savannah, Ga., 4 July 1817; d. New York, 28 Oct. 1887. He studied at Edinburgh and at various European universities; and began his practice in New York in 1847. In 1851 he became professor of surgery at the New York Medical College, and surgeon-in-chief to the State Immigrant Hospital. At one time he cured neuralgia by excising the whole trunk of the second branch of the fifth pair of nerves. In 1852 he tied the femoral artery to cure exaggerated nutrition. He also tied the primitive carotid artery on both sides, to cure elephantiasis of the neck. In 1853 he exsected the entire radius, in 1854 the entire ulna. He published a treatise on 'Congenital Dislocations,' and a translation of Rokitausky's 'Pathological Anatomy.'

Carnot, Lazare Hippolyte, lä-zär ē-pō-lēt kär-nō, French statesman, second son of the preceding: b. St. Omer, 6 April 1801; d. 16 March 1888. He was of liberal opinions, became a disciple of St. Simon, and wrote the 'Exposition générale de la doctrine Saint Simonienne,' the authorship of which was, with his consent, ascribed to Bazard. But as soon as St. Simonism assumed the form of a religious creed, Carnot parted with his friends, and became a journalist, and the chief editor of the 'Revue encyclopédique.' He was also entrusted with the publication of Grégoire's and Barère's 'Mémoires.' He was elected to the chamber of deputies in 1839, and re-elected in 1842 and 1846. After the revolution of February 1848, he was minister of public instruction until 5 July, and improved, as such, the condition of the teachers, rendered the normal schools free, and established free lectures. In 1848 he was elected to the constituant, and 10 March 1850, to the legislative assembly. After the *coup d'état* of December 1851, he left France; during his absence, he was elected a member of the *corps législatif,* but refused to take the oath. He was re-elected in 1857, but again refused to serve. He published the memoirs of his father (1860–4).

Carnot, Lazare Nicolas Marguerite, lä zär nĭk-ō-lä mär-gä-rēt, French soldier and statesman: b. Nolay, Burgundy, 1753; d. Magdeburg, 2 Aug. 1823. From his youth he exhibited an uncommon talent for the mathematical and military sciences, entered the corps of engineers, and rose in office by the favor of the Prince of Condé. He published, afterward, 'Mathematical Essays,' which caused him to be elected a member of several learned societies. His eulogy on Vauban received the prize of the Academy of Dijon. In 1791 he was appointed deputy to the constituent assembly, but at first took part only in military affairs. On his proposal the officers of the nobility were removed from the army, and others substituted from the citizens. He also proposed that implicit obedience should only be demanded of the soldier in presence of the enemy, at other times he should have all the privileges and rights of the citizen; a strange proposal to come from a military chief. As a member of the convention he voted for the death of Louis. In the following March he was sent to the army of the north, where he put himself at the head and repulsed the enemy. On his return to the convention he was made a member of the Committee of Public Safety. The influence of Carnot in the military operations now began to be more deeply felt. In possession of all the plans deposited in the archives of Louis XIV., he organized and directed the French armies; and his direction undoubtedly contributed very much to their success. After the fall of Robespierre he was often accused, but always acquitted, because his duty had been to take care of the defense of the country, and he could not be made answerable for the cruel decrees of Robespierre, in which Carnot's name, as he was a member of the committee, was of course to be found. At the establishment of the directory in 1795 Carnot was chosen a member, and for some time maintained an important influence. Barras at length succeeded him in the department of war, and was ever after his enemy. His plan for the overthrow of Barras was unsuccessful, and with some others he was sentenced to transportation on the 18th Fructidor (Sept. 4) 1797. He fled to Germany and published a defense, which was eagerly read in Paris, and by the exposure of the conduct of his former colleagues hastened their overthrow on the 30th Prairial (June 18) 1799. After the 18th Brumaire Carnot was recalled, and appointed *inspecteur aux revues,* and two months later, in April 1800, minister of war. He soon after retired into the bosom of his family, but was called to the tribunate, 9 March 1802. He often opposed the views of the government, voted against the consulship for life, and his was the only voice raised against the proposal for the imperial dignity. He remained, however, a member of the tribunate till it was abolished, passed the next seven years of his life in retirement, and published several valuable military works. In 1814 Napoleon gave him the chief command at Antwerp. He connected a vigorous defense with a careful regard for the interest of the city, which, by the command of Louis XVIII., he afterward surrendered to the British General Graham. He still retained his titles and his honors, but as a firm republican he could never expect the favor of the court; particularly as, in his memorial to the king, he openly and severely censured the measures of government, in consequence of which he was passed over in the new organization of the Academy of Sciences. When Napoleon was once more at the helm of state in 1815, he made Carnot count and peer of the empire, and pressed upon him the ministry of the interior. Carnot discharged the difficult duties of this office with his usual integrity. After the emperor's second fall he was made a member of the provisory government of France, and was afterward the only one of the members of it comprehended in the ordinance of 24 July. He retired to Cerney, where he employed his pen on political subjects; then to Warsaw with his family; and finally to Magdeburg. Among Carnot's writings the most valuable are his 'Essai sur les Machines'; 'Réflexions sur la Métaphysique du Calcul infinitésimal'; 'Sur la Géometrie de Position'; 'De la Défense des Places fortes'; 'Ex-

posé de la Conduite politique de Carnot, depuis le 1 Juill. 1814.' In Magdeburg Carnot published 'Mémoire sur la Fortification primitive,' and a volume of poems. He was rigid in his love of virtue, a scholar, a general, and an inflexible republican. He was universally esteemed, both in France and in foreign lands, and was honored by all parties.

Carnot, Marie François Sadi, mä-rē fräṅ-swä sä-dē, French president, grandson of Carnot (q.v.): b. Limoges, 11 Aug. 1837; d. Lyons, 24 June 1894. He was educated at the École Polytechnique and became a civil engineer. In 1871 M. Gambetta appointed him prefect of the Seine-Inférieure, and intrusted him with the duty of seeing to the defenses of his department, a task which he fulfilled with great ability. M. Brisson gave him the portfolio of public works in his cabinet of 1885, and in the following year he became minister of finance, retaining this post under Brisson's successor, De Freycinet. In 1887 he was elected president of the French republic in succession to M. Jules Grévy, but before his term of office had expired he was assassinated at Lyons by an Italian anarchist named Caserio.

Carnot, Nicolas Léonard Sadi, nĭk-ō-lä lā-ō-när sä-dē, French physicist: b. Paris 1 June 1796; d. there, 24 Aug. 1832. He was educated at the polytechnic school; in 1814 he entered the engineer corps, where he served until 1828, becoming captain in 1826. In 1824 he published his book, 'Reflexions sur la Puissance Notrice du Feu,' in which he laid down the principle that the efficiency of a thermodynamic engine is proportional to the amount of heat transferred from the source of heat to the condenser; and that heat passes only from a warmer to a colder body. This is called the second law of thermodynamics and is known also as Carnot's principle.

Carnotite, a mineral first described in 1899, and now one of the most important ores of uranium. It is a hydrous vanadate of uranium and potassium, its formula being, perhaps, $K_2O.\ 2U_2O_3.\ V_2O_5.\ 3H_2O$. Radium has been shown to be present in it and radiographs may be made from the crude mineral. It seems likely that it will become an important ore of radium. It is a canary-yellow crystalline powder, usually occurring disseminated through sandstone, but sometimes in earthy masses of considerable richness. Its chief locality is in Montrose County, Colo., but it has recently been reported from Utah.

Carnun'tum, an ancient Celtic town in the northern part of Pannonia, on the Danube, near where Hainburg now stands.

Caro, kä'rō, **Annibale,** Italian author: b. Citta Nuova, 1507; d. 1566. In 1543 he was appointed secretary to Pietro Ludovico Farnese, Duke of Parma and Piacenza, who entrusted him with several missions to Charles V. After the assassination of the Duke his own life was in considerable danger. He took refuge in Parma, and was treated in a friendly manner by the new Duke Octavio Farnese, whose two brothers, the cardinals, Ranuccio and Alexander, took him successively into their service. With the latter he remained from 1548 to his death in 1566, and received from him several ecclesiastical preferments. Caro devoted himself chiefly to the study of numismatics and the Tuscan language, and his pure and elegant style in verse and prose soon became generally admired. His translation of the Æneid in blank verse is excellent. After his death appeared a translation by him of Longus, and of Aristotle's 'Rhetoric'; also 'Rime' (1569), and 'Lettere familiari' (1572–5), the former of which are admired for the elegance of the verse, and the latter as models of beautiful Italian prose.

Caro, Elme Marie, ĕlm mä rē kä-ro, French philosopher: b. Poitiers, 4 March 1826; d. 13 July 1887. He was a lecturer at the École Normale of Paris in 1857, professor at the Sorbonne 1867, and a member of the French Academy in 1876. He was one of the popular lecturers of his day and his lectures in defense of the Christian religion were largely attended, being especially popular with women. He published 'L' Idée de Dieu et ses nouveaux Critiques'; 'La Philosophie de Goethe'; 'La Materialisme et la Science'; 'Etudes Morales sur le Temps présent'; 'Nelanges et Portraits.'

Caro, Jakob, yä kōb kä'ro, German historian: b. Gnesen, 2 Feb. 1836. He was educated at Berlin and Leipsic, traveled in Galicia and southern Russia, and in 1863 became lecturer at the University of Jena and later professor; in 1868 he was professor at Breslau. He has written 'Das Interregnum Polens 1856' (1861); 'Liber Cancellariæ Stanislai Ciolek' (1871–4); 'Lessing und Swift, Studien uber Nathan den Weisen' (1869); 'Aus der Kanzlei Kaiser Siegsmunds' (1879); 'Das Bundniss zu Canterbury' (1880); 'Beata und Halszka, eine Polnisch-Russische Geschichte aus dem 16. Jahr hundert.' (1880); and a continuation of Röpell's 'Geschichte Polens.'

Caro, Miguel Antonio, mē-gĕl' än-tō'nē-ō, Colombian prose-writer and poet: b. Bogotá, Colombia, 10 Nov. 1843. He has been an editor and contributor to periodicals. His principal works are 'Poems' (1866); 'Hours of Love,' a prose work; and a translation into Spanish verse of Virgil's complete works (3 vols. 1873–5). He is a correspondent of the Royal Spanish Academy, and in 1886 was national librarian in the Colombian Congress.

Carob, kăr'ŏb, or **Algaro'ba-bean** (*Ceratonia siliqua*), a leguminous plant of the suborder *Cæsalpineæ*, growing wild in all the countries bordering the Mediterranean, and more especially in the Levant. It has a dark-green foliage, and produces pods in which the seeds are embedded in nutritious pulp, of the taste and consistence of manna. The names "locust" and "St. John's bread" have been given to the legumes of this plant, from an idea that they were the food eaten, along with wild honey, by the Baptist in the wilderness. The legumes are sometimes imported into this country as food for horses, this being their principal use in the south of Europe and the north of Africa, where the plant is cultivated. Singers are said to chew the seeds for improving the voice.

Caröe, kä'rō, **William Douglas,** English architect of Danish parentage: b. Liverpool, 1857. He was educated at Trinity College, Cambridge, and studied architecture with the eminent architect, John L. Pearson. He is architect to Southwell Cathedral and to the Diocesan societies of Lichfield and Derbyshire, as well as to the dean and chapter of Canter-

bury. Among his principal works are the archbishop's palace at Canterbury, bishop's palace at Bristol; St. David's Church at Exeter; Wycombe Abbey School; and the Jubilee Monument to Queen Victoria at Mentone, France. He has also restored many buildings of historic interest.

Carol, a song of praise sung at Christmas or Easter. It originally meant a song accompanied with dancing, in which sense it is frequently used by the old poets. It appears to have been danced by many performers, by taking hands, forming a ring, and singing as they went round. It has been said that the oldest carol was that sung by the heavenly host when the birth of the Saviour was announced to the shepherds on the plains of Bethlehem. It is probable that the practice of singing carols at Christmas-tide arose in imitation of this, as the majority of the carols declared the good tidings of great joy; and the title of Nöels, nowells, or novelles, applied to carols, would seem to bear out this idea. Carol singing is of great antiquity among Christian communities, as the carol by Aurelius Prudentius, of the 4th century, will show.

Carolan, kär'ō lăn, **Turlogh,** Irish musical genius: b. near Nobber, County of Westmeath, about 1670; d. 1738. Having lost his sight when a child, he studied the harp, and in after life not only maintained himself thereby, but even became famous.

Carolanos, kä-rō-lä'nōs, a heathen tribe of the Philippines, living in the mountain lands of the island of Negros, especially the Cordillera of Canyan. They are of Malayan stock and may be identical with the Buquitnon, though that cannot be determined. Practically nothing is known of them.

Caroli, Pietro Francesco, pē ā trō frănchēs'kō kä'rō lē, Italian painter: b. Turin 1638; d. 1716. He studied painting at Venice, Florence, and Rome, and was professor in the Academy of Rome at his death. He is celebrated for his careful execution and beautiful coloring, and excelled particularly in perspective, of his skill of which he has left excellent specimens in his drawings of the interior of some of the Roman churches.

Carolina, kä-rō-lē'na. This name is generally given to a famous law of the German Empire, of the year 1532, under Charles V., which he himself called an ordinance of criminal procedure (*Peinliche Gerichtsordnung*). From him it was at a later period called *Constitutio criminalis Carolina,* or shortly *Carolina.* The arbitrary administration of justice, the disorder and cruelty which had become customary in the courts of Germany, where many a process was begun and ended with torture, and persons were sentenced even to death without regular process, gave occasion to this law. From the beginning of the peace of the land the necessity of such a law was felt throughout the country; but it was difficult in this, as in all other cases, to make the different members of the empire agree on one general measure. The Baron Johann von Schwarzenberg was chiefly instrumental in introducing this ordinance. He became minister of state of the Prince-bishop of Bamberg, and succeeded in procuring an ordinance of criminal procedure for Bamberg to be drawn up and published in 1507. The same was also adopted in 1510 by the margrave of Brandenburg and Franconia; and at last a law of criminal procedure for the empire at large was passed by the diet at Ratisbon, in 1532. The Carolina contains 219 articles, which regulate the standing and oaths of judges, the character of witnesses, the penalties of different crimes, and the circumstances in which torture at that time common in criminal jurisprudence should be applied. Several German princes, as the elector of Saxony, the elector of Brandenburg, and of the palatinate, protested against it, in order to protect the laws of their states and their own privileges against the legislative power of the emperor; but at last the Carolina was established in almost every part of the empire. From the connection of Switzerland with Germany, and the fact that several Swiss towns were imperial cities, German laws frequently passed into Switzerland, and the Carolina became the law by which even the Swiss troops in the service of the kings of France were governed until the French Revolution.

Caroli'na Allspice. See CALYCANTHUS.

Carolina, Original Constitution of. For many years after the subversion of the old English order by political and religious insubordination, 1642–60, the dominant idea of the conservatives was to prevent its recurrence, as with the conservatives after the French Revolution; and their chief dread was of republicans and dissenters. It is an almost grotesque incident of this reaction, that by far its narrowest embodiment came from a liberal philosopher and an unbelieving incendiary politician,—John Locke and Lord Shaftesbury (Anthony Ashley Cooper). A group of eight noblemen, headed by the famous Lord Clarendon, and including Shaftesbury, were granted on 24 March 1663, a tract called the province of Carolina, after Charles II.; as extended 30 June 1665, it included the present North and South Carolina and Georgia, and in theory stretched west to the Pacific. "To avoid erecting a numerous democracy," in their own words, they had Locke, who was Shaftesbury's secretary, draw up (whether on his own lines or Shaftesbury's is a moot point) a form of government called the "Fundamental Constitutions," which is a classic for impractical absurdity even among Utopias. The mass of the people (not alone, be it remembered, the future immigrants, but a considerable population already living there in pure democracy) were to be hereditary "leet-men," or serfs of the soil. Next above them was a sort of upper middle-class commons called "lords of the manor," who could let out 10-acre tenant farms. Over both (as the charter gave the proprietors the right to create titles of nobility other than English ones) were a fantastic self-perpetuating colonial *noblesse,* of "landgraves" and "caciques." Crowning the whole were the proprietors; the eldest was "palatine" or viceroy, the others were admiral, chamberlain, high constable, chief justice, chancellor, high steward, and treasurer. The "leet-men" held three fifths of the land; the nobility and "lords of the manor" one fifth, not to be alienated after 1700; the proprietors the remaining fifth. The province was divided checkerboard fashion into squares, first of counties; then each county into eight "signeries" for the proprietors, eight

"baronies" for the nobility (each signory and barony to contain 12,000 acres, perpetually annexed to the title), and four "precincts," and each precinct into four "colonies" for the serfs. There was a Parliament; but the commons were carefully kept powerless by giving them only 14 members out of 50, making only freeholders of 500 acres eligible to seats, and electing them for life; with the further proviso that landgraves could sit in either house at will, and vote on the same measures in both. All initiative was in a supreme executive council, which prepared and submitted all legislation to Parliament; and the proprietors had a veto on all. Each proprietor had a superior court at which he presided in person or by proxy; each nobleman held a court-leet for his barony, and there were precinct courts. The laws were worthy of this closet constitution. The English Church was established and supported by public taxation, in a province inhabited largely by Quakers, and the rest by Scotch Presbyterians, Huguenots, Luthcrans, etc. No one could live or hold property in or be a freeman of the province who did not acknowledge God, and that he is to be publicly worshipped. Every person above 17 not a member of some church, or who did not subscribe the "Fundamental Constitutions" and promise in writing to defend and maintain them, should be an outlaw. There was a severe censorship of the press, of ceremonies, of fashions, and of sports, in the hands of the nobility. Paid lawyers were prohibited; thus compelling the commons to put themselves under a relation of "clientage," in Roman fashion, to the nobility to avoid ruin. All commentaries on the constitution or laws were forbidden. This constitution was to replace one under which the people were ruled by a council of 12, chosen half by the proprietors and half by the Assembly; that Assembly consisting of 12 elected freeholders, so that the people had 18 out of 25 votes; with entire freedom of religion, civil marriage, security for five years from suit on cause arising outside of the country (for protection of emigrant debtors), exemption from taxation for the first year, and no political or social superiors anywhere. That is, free Englishmen in virtual democracy were to become at a blow the serfs and villeins of the time of the Norman Conquest. The proprietors bound themselves by solemn compact to maintain this incredibly foolish instrument as unalterable forever, and evidently expected men to emigrate to a savage wilderness on such terms. Five successive forms of this constitution were promulgated before its entire abandonment in 1693, each in turn proclaimed permanent and unalterable; and the result, especially in Albemarle County (afterward North Carolina), was simple anarchy. The people set them utterly at naught; and while the former system had been legally abolished, it continued in force by suffrance. Resistance to law as a first principle of life became ingrained in them; and the character of the colony was long and deeply injured by the quarter-century of attempt to force its people, new and old, into this iron mold of extreme feudalism. For further history, see NORTH CAROLINA; SOUTH CAROLINA.

Carolina-pink, Maryland Pinkroot, or **Worm-grass,** names given to the *Spigelia marilandica,* a plant of the order *Loganiaceæ,* bearing scarlet flowers, and having a root used as a vermifuge. It occurs in rich woods, and extends from New Jersey, west, north, and south, to Wisconsin and Texas.

Carolina Ridge, in geology, the name given to an elevation of the bottom of the Atlantic Ocean off North Carolina, that occurred in Miocene time. It deflected the Gulf Stream and caused a great change in climate along the Atlantic coast. See MIOCENE; TERTIARY.

Car'oline Amelia Elizabeth, Queen of England, wife of George IV., king of Great Britain and Hanover, second daughter of Duke Charles William Ferdinand of Brunswick: b. 17 May 1768; d. London, 6 Aug. 1821. She was married to the Prince of Wales, afterward George IV., in 1795. After the birth of her daughter, Charlotte Augusta (7 Jan. 1796), her husband abandoned her, declaring that no one could force his inclinations. This was the beginning of the disgraceful dispute between the two parties, which lasted till the death of Caroline, and exposed her honor to repeated accusations from her husband. The Princess of Wales lived retired from the court, at a country-seat at Blackheath, till 1808. In 1813 the contest was renewed between the two parties, the Princess of Wales complaining, as a mother, of the difficulties opposed to her seeing her daughter. In 1814 the princess obtained permission to go to Brunswick, and afterward to make the tour of Italy and Greece, in which the Italian Bergami was her confidant and attendant. Many infamous reports were afterward circulated, relating to the connection between the Princess and Bergami. When the Prince of Wales ascended the throne, 29 Jan. 1820, he offered her an income of £50,000 sterling, on condition that she should renounce the title of Queen of England, and every title appertaining to that dignity, and should not again return to England. She refused the proposal, returned to England, 5 June, and the next day entered London amid public demonstrations of welcome. She was now tried for adultery, but not convicted, and in this trial Brougham acted as the queen's attorney-general. Though banished from the court, the queen still lived at Brandenburg House, maintaining a style suitable to her rank. She was refused admission to Westminster Abbey on the occasion of the coronation of her husband, on 19 July 1821, and published a protest in the newspapers. Her tomb at Brunswick has a very short inscription, in which she is called the unhappy queen of England.

Caroline Matilda, Queen of Denmark, daughter of Frederick Louis, Prince of Wales: b. 1751; d. Celle, Hanover, 10 May 1775. She was married in 1766 to King Christian VII. of Denmark. She became the object of court intrigues caused by the jealousy of the grandmother and stepmother of her husband. These led to the execution for treason of Counts Struensee and Brandt, who were of the queen's party, and to the imprisonment of the queen herself, who was liberated through the interference of her brother, George III. of England. Her last hours are described in a small work, 'Die letzen Stunden der Königin von Danemark.'

Caroline, The, an American steamboat used in 1837 by the American sympathizers with the Canadian insurgents under William Lyon Mackenzie (q.v.). The latter, after years of agitation, had gathered a band of insurgents in December, and attempted to seize Toronto,

capture the lieutenant-governor and his cabinet, and proclaim a republic. He was defeated, and fled to Navy Island on the British side of the Niagara River. Some hundreds of American sympathizers joined him, and he set up a "provisional government," issued paper money, and offered bounties for volunteers and a reward for the apprehension of the lieutenant-governor. On 29 December an American steamer, the Caroline, crossed over to his camp from Schlosser on the American side, laden with reinforcements, provisions, and munitions; and returning, lay at Schlosser that night full of men presumably ready for a similar trip the next day. The Canadians, incensed at this outrageous violation of neutrality, sent over an armed party in boats to enforce it. They boarded the Caroline, hustled the passengers and crew ashore, killing one man (Amos Durfee) on shore in the fray, towed the vessel out into the stream, set it on fire, and sent it over Niagara. A great uproar ensued. President Van Buren issued a proclamation ordering the neutrality laws to be respected, and, calling out the militia under Winfield Scott, he then demanded reparation from the British government. The latter naturally showed no great alacrity in responding. Shortly afterward, one Alexander McLeod came over to the American side, boasting that he was one of the boarding party and had killed one of the Caroline's men with his own hand. He was arrested, indicted by the grand jury for the murder of Durfee, and imprisoned to await his trial. Fox, the English minister, demanded his release; the secretary of state (Forsyth of Georgia) replied that he was in the hands of justice in New York State, and must await its course; Lord Palmerston thereupon assumed for the English government full responsibility for the assault on the Caroline, and again demanded his release. But Fox in his letter curiously added that the government had every reason to believe that McLeod was not one of the boarding party; in which case, of course, he was either a mendacious braggart or a common murderer, and the matter of the Caroline was irrelevant. Webster, now secretary of state, replied, ignoring this point, that if the case were in a Federal court the President would order a *nolle prosequi* entered; but it being in a State court, he could only await its action, and if it did not discharge McLeod, the case should go up to the United States supreme court. In the July term of 1838 a writ of *habeas corpus* was sued for in the New York supreme court, but refused. McLeod was acquitted, however, and the whole affair dropped.

Caroline Books, or **Libri Carolini,** a theological work in four books, prepared under the direction of Charlemagne (Carolus Magnus), in connection with the disputed question of image worship that seriously agitated the Church during the reign of that monarch. The second synod of Nicæa had given its approval to the use of images, agreeing in this point with the views of the Eastern Church. Owing to a misunderstanding of the Nicæan canons through a bad translation, which seemed to make the Eastern synod declare that the worship due to God alone, *latria,* should be paid to images, the 'Libri Carolini' severely reviewed the doctrine. The condemnation of image worship as formulated in the Caroline Books does not, however, bear upon the inferior honor, *dulia,* paid to the saints and their images, or that given to the Virgin, *hyperdulia.*

Caroline Islands, a large archipelago in the North Pacific Ocean, between lat. 3° and 12° N., and lon. 132° and 163° 6′ E., and between the Philippines and the Marshall isles. Area, about 560 square miles. It contains many groups, embracing in all about 500 islands and islets. Many of them are mere coral reefs, little elevated above the ocean. The most westerly group is the Paloas, or Pelew Islands, which contain seven large and many small ones, all of coralline formation. The next group, Yap or Gouap, lies northeast of the last. In its chief island, which is mountainous, precious metals have been found. The other principal groups are Lutke, Mortlock, Siniavin, Enderby, and Hogoleu. The most easterly island is Ulalan. The most important vegetable productions are palms, bread-fruit trees, and bananas. The inhabitants, numbering about 35,000, though mainly Micronesians, include various races, and have made very different degrees of progress in civilization. In the central groups they are of a handsome physical type, active and industrious, and have some commerce. On the east generally, and on the west, with the exception of the Pelew Islands, the inhabitants, though apparently of the same stock, are far less advanced. The islands were discovered in 1527 by the Portuguese, who gave them the name of Sequeira. In 1686 they were annexed and renamed in honor of Charles II. by the Spaniards, who soon changed the name to New Philippines. After several futile missionary attempts in the 18th century, Spain took little active interest in the group until August 1885, when the German flag was raised over Yap. A serious dispute followed this act, and the question being submitted to the Pope as arbitrator, he decided in favor of Spain, reserving special trade privileges to Germany. In 1887 disturbances broke out at Ponapé, in which the governor, who had arrested one of the American Protestant missionaries, was killed by the natives; but the rising was soon suppressed. In February 1899 Germany purchased from Spain for about $3,300,000 the Caroline and Pelew islands, and all of the Ladrones, but Guam, which had been ceded to the United States in the treaty of peace that ended the Spanish-American war.

Carolingians. See CARLOVINGIANS.

Carolus-Duran, Auguste Émile, ā-mēl kā-rō-lüs-dü-rāṅ, French portrait painter: b. Lille, 4 July 1837. His name was originally Charles Auguste Émile Durand. He was a pupil of Suchon, and received the medal of honor at the Salon of 1819. Ten years later he was created commander of the Legion of Honor. He is a brilliant colorist, and as a painter of women has long been a favorite. Many American artists have studied under him in Paris. Among characteristic works of his are 'La Prière du Soir' (1863); 'The Lady with the Glove'; and portraits of Émile Girardin; Queen Maria Pia, of Portugal; Countess of Warwick; and Duchess of Marlborough.

Carolus, a gold coin struck in the reign of Charles I., and originally 20 shillings in value, afterward 23 shillings. The name was given also to various other coins.

Carora, kä-rō'rä, Venezuela, a city of the state of Lara, situated 95 miles south of Coro on a tributary of the Tocuyo River. It was founded by the Spaniards in 1572. It has a considerable trade in gums, rubber, and cochineal, and the raising of cattle mules is one of the chief industries. Pop. 8,000.

Carotid Artery, either of the two great arteries which convey the blood from the aorta to the head and the brain. In the article on the aorta (q.v.) the origin of the carotid arteries is described,— that from the right side springing from the innominate artery to supply most of the right side of the head; that on the left side arising directly from the aorta to supply all of the structures of the left side of the head. Apart from these slight variations in their origin on the two sides, the carotid arteries and their branches are practically duplicated in the two halves of the head. Thus the main branches, the common carotids, soon branch into two, the external and internal carotids. This division takes place about at the level of the thyroid cartilage. The external carotid supplies the upper part of the front and side of the neck, the tongue, larynx, pharynx, face, the pterygoid regions, the upper part of the back of the neck, the scalp, and the major portions of the brain membranes. The internal carotid soon enters the skull and supplies the greater part of the brain tissue, the orbital structures (the eye, etc.), and portions of the brain membranes. The branches of homologous arteries of the two sides anastomose somewhat, although many of the arteries of the brain are terminal arteries and do not anastomose. Occlusion of one of these vessels in the brain usually results in permanent injury. In deep cuts of the throat these arteries may be involved, but they lie very deep as a rule and are not often severed. (Morris, 'Anatomy'; Gray, 'Anatomy.')

Car'otin (Lat. *carota,* "a carrot"), the coloring-matter of the carrot. Its formula is doubtful, for although carotin appears, from such analyses as have been made, to be a simple hydrocarbon, no other strongly colored hydrocarbon is known, and hence the probability is that oxygen is also an essential constituent. It may be extracted from the chopped carrot by the action of carbon disulphide, in which (as also in benzene) it is very soluble. It crystallizes in small, red plates, which are insoluble in water and in alcohol. A similar compound, called "hydrocarotin," is also known.

Carotto (kä-rō'tō) **Family.** 1. GIAN FRANCESCO, jän frän-chĕs'kō, Italian painter: b. Verona, 1470; d. there, 1546. He studied under Liberale at Verona and under Andrea Montegna at Mantua. His earlier productions are in imitation of the style of Montegna; but at a later period the study of the works of Leonardo da Vinci and Raphael produced a decided change. Carotto is not distinguished by the grandeur of his conceptions, but excels in character and expression, and in the softness and the warmth of coloring. Verona contains most of his works. Among these is the 'History of Tobias,' a series of pictures in the church of Saint Eufemia. 2. GIOVANNI, jō-vän'nē, Italian painter: d. 1555. He was the brother of Gian, and his pupil. He was chiefly an architectural painter and is celebrated for his copies of ancient ruins. He is also said to have given instruction to Paul Veronese.

Carouge, Switzerland, a town of the canton of Geneva, on the left bank of the Arve, opposite Geneva, with which it is connected by a bridge. It has machine-works, foundries, dye-works, and manufactures of watches. It was ceded to Switzerland in 1816, until which time it had been the capital of the Sardinian province of Carouge, which was suppressed in 1837. Pop. (1902) 7,500.

Carp, a name applied to many fishes belonging to the *Cyprinidæ.* The members of this family inhabit fresh waters, and are extremely numerous in genera, species, and individuals. It is estimated that there are more than 1,000 species. One group of the family, found in North America, includes fishes known as suckers, buffalo-fishes, redhorses, and mullets, while another group contains the minnows, dace, fatheads, chubs, etc. They are all soft-finned fishes, with a stout, serrated spine, which stands in front of both the dorsal and the anal fins. There are no teeth in the mouth, but they are developed in the pharyngeal bones; that is, in the throat. The flesh is not of the best quality, and is full of fine bones. The name carp is especially applied to one fish — *Cyprinus carpio.* This was introduced into North America from Europe by the United States Fish Commission, but it came originally from Asia. It inhabits our streams and lakes, where it is increasing rapidly in numbers. It reaches a length of two feet and may attain a weight of 40 pounds. It is a scaly, compressed, robust fish, with well-developed barbels and dorsal fin, and a short anal, and is of a brownish hue. Owing to its hardiness, its durability under extreme temperatures, the facility with which it may be raised because of its adaptability to sluggish ponds and swampy lakes, it might form an important element in the fish food-supply of the North American interior, since farmers can raise it easily in their mill-ponds. It feeds upon vegetable fare, larvæ, insects, etc., and during the winter months hibernates, at which time it requires no food. The eggs, also, are very hardy, and number several hundred thousands to each individual. They adhere to aquatic grasses and weeds.

The carp is usually covered with large scales; but one variety of it, the "mirror carp," has only a few large scattered scales; while another species, the "leather carp," is wholly without scales. (Consult the publications of the United States Fish Commission.)

Carp-sucker, a common and little-valued fresh-water fish of the genus *Carpiodes,* related to the buffalo-fishes and suckers. It is found throughout the central part of the United States, takes its name from its carp-like form, averages about two feet in length, and is a dull green above, grading into silver beneath.

Carpaccio, Vittore, vē tō rā kär-pä'chō, Italian artist: b. Istria, about 1450; d. 1525. He was one of the most celebrated masters of the old Venetian school, and was the rival of Bellini and the last Vivarino. All that is known of his life is that he belonged to Venice. of which he has reproduced in the back-ground of his pictures the streets and monuments. His distinguishing characteristics are natural expression, vivid conception, correct arrangement,

and great variety of figures and costumes. He also excelled as an architectural and landscape painter. His favorite employment was the dramatic representation of sacred subjects, several of which he has illustrated by a series of paintings. Of these the most celebrated are the histories of St. Ursula and St. Stephen. The former, consisting of nine pictures, is now in the Academy at Venice, and has been engraved; the latter, in five pictures, is in Paris, Milan, and Berlin. The 'Madonna and Child Enthroned,' supposed to be an earlier production, is in the National Gallery, London. BENEDETTO, CARPACCIO, a son or grandson of the above, flourished about the middle of the 16th century, and is known for a fine painting of the 'Coronation of the Virgin' in the church of Capo d'Istria.

Carpani, Giuseppe, joo sĕp'pē kär-pä'nē, Italian dramatist and writer on music: b. Villalbese, near Milan, 28 Jan. 1752; d. Vienna, 22 Jan. 1825. Having prepared for the profession of the law, he afterward devoted himself to literary pursuits, and produced a great number of plays and operas partly translations and partly original. In 1792 he was editor of the 'Gazzetta di Milano,' and wrote violent articles against the French Revolution. He was obliged to leave the city after the invasion of the French, and went to Vienna, where he was appointed censor and director of the theatre. In 1809 he accompanied the Archduke John in the expedition against Napoleon. Under the title of 'Haydine,' he published a series of curious and interesting letters on the life and works of his friend Haydn, the composer. These letters, published in a French translation as an original work by L. A. C. Bombet, or, as other biographers state, by Beyle (known under the *nom de plume* of Stendhal), gave rise to a great literary controversy, in which Carpani vindicated his authorship most successfully.

Carpa'thian Mountains, a range of mountains in central Europe, forming for the greater part of their extent a natural boundary of Hungary, in the shape of a semicircular belt of nearly 800 miles in length, extending from Orsova on the Servian frontier, to Presburg. Its breadth is considerable, reaching a maximum of 240 to 250 miles, between the Banat and Transylvania. The Carpathian chain may be divided into two great sections, the East and the West Carpathians, the former curving from the mouth of the Nera to the source of the Theiss, and forming the boundary between Austria and Rumania; the latter proceeding from the sources of the Theiss and the Pruth, and terminating on the banks of the Danube west of Presburg, and forming the boundary between Hungary and Galicia. To the western Carpathians belongs the remarkable group of the Tatra, in which is situated the culminating summit of the whole system, the Gerlsdorf Peak, 8,737 feet. Several other peaks exceed 8,000 feet. The loftiest summit of the eastern Carpathians reaches an elevation of 8,318 feet. The most remarkable and frequented passes are those of Teregova, leading from Orsova to Temeswar; of Vulkar, forming the valley in which the Schyl flows; and of the Rothenthurm, in a gorge formed by the Aluta at the foot of Mount Szurul. The outer bend of the Carpathians is much steeper than that which descends toward the valleys of Transylvania and Hungary. The only important rivers which actually rise in the chain are the Vistula, the Dniester, and the Theiss. The formation of the Carpathians took place mostly in the Tertiary period, and was practically completed at the end of the Miocene. The eastern part of the Carpathian chain, from Orsova to the source of the Burcza, near Kronstadt, is entirely composed of primitive rocks. These are succeeded by grauwacke, which extends to the sources of the Theiss, and is only interrupted by a primitive group between the pass of Borgo and the source of the Viso. A great chain of trachyte appears on the frontiers of the Bukowina, and stretches to the point where the Aluta begins to flow southwest. To the west of this chain, on approaching the plains, an extensive tract of sandstone belonging to the coal formation begins to appear, and covers the greater part of Transylvania. Tertiary formations surround the vast plains of Hungary, which consist of a rich alluvium, and must once have been the bed of a lake. Basalt frequently occurs, but no distinct traces of extinct volcanoes have been found. The Carpathian range is rich in minerals, including gold, silver, quicksilver, copper, and iron. Salt occurs in beds, which have sometimes a thickness of 600 or 700 feet, and are apparently inexhaustible. On the plateaus corn and fruit are grown to the height of 1,500 feet; higher up the mountain steeps are covered with forests of pine, some of them as high as 5,500 feet. About 6,000 feet seems to be the vegetable limit. Above it a few lichens may be found, but in general nothing is seen but bare, steep rocks, many of them in the form of conical peaks.

Carpathos, kär'pa thŏs, an island in the Ægean Sea, now called Skarpanto. It is now under Turkish rule; in ancient times it belonged to Rhodes.

Carpeaux, Jean Baptiste, zhŏn bäp'tēst kär-pō, French sculptor: b. Valenciennes, France, 14 May 1827; d. Courbevoie, near Paris, 12 Oct. 1875. He studied at the School of Architecture in Valenciennes, and later went to Paris, becoming a pupil of Rude and of Duret. In 1854 he obtained the Prix de Rome. His bronze 'Neapolitan Boy' attracted notice; and 'Ugolino and His Four Sons' (1863), also in bronze, though it defied the canons of sculpture, made him famous. He settled in Paris in 1862. His masterpiece, a marble group, 'The Dance,' in the façade of the New Opera in Paris, fully showed his dramatic power and the exuberance of his imagination; but it provoked much hostile criticism as involving an attempt to stretch beyond their natural province the limits of the plastic art. The most notable of his later works is the great fountain in the Luxembourg Gardens.

Car'pel, the leaf forming the pistil. Several carpels may enter into the composition of one pistil.

Carpenta'ria, Gulf of, a large gulf indenting the northern coast of Australia, named for its discoverer, Pieter Carpenter. Cape York Peninsula, the northern extremity of Queensland, is on the east, and Arnhem Land on the west. It contains a number of islands, among them Groote Eylandt, Sir Edward Pellew Islands, and Wellesley Islands. Its maximum width is about 400 miles, and its length 460 miles. The land around is generally low.

Carpenter, Charles Carroll, American naval officer: b. Greenfield, Mass., 27 Feb. 1834; d. 1 April 1899. He was promoted commodore 15 May 1893, and rear-admiral 11 Nov. 1894; was commander-in-chief of the United States Asiatic squadron from 27 Aug. 1894, till 9 Nov. 1895; and was retired on reaching the age-limit, 28 Feb. 1896. During the summer of 1895 he rendered invaluable service in China in protecting American missionaries and in co-operating with United States Minister Charles Denby and the British and Chinese authorities to preserve peace, particularly after the Kucheng massacre.

Carpenter, Edmund Janes, American journalist: b. North Attleboro, Mass., 16 Oct. 1845. He was for many years on the editorial staffs of Providence, New Haven and Boston papers, and has published 'A Woman of Shawmut: a Romance of Massachusetts Bay Colony, 1640' (1892); 'America in Hawaii' (1898).

Carpenter, Edward, English socialistic writer: b. Brighton, England, 20 Aug. 1844. He was educated at Trinity Hall, Cambridge, and was for some time Fellow and lecturer there, as well as curate under the noted F. D. Maurice. In 1874 he gave up his fellowship and left the ministry, and until 1881 lectured on science and music in university extension work. He has since devoted his time to literary work, market gardening, and socialist propaganda. In 1884 he visited the United States in order to meet Walt Whitman. He has published 'Towards Democracy'; 'Love's Coming of Age'; 'Angels' Wings'; 'Adam's Peak to Elephanta'; 'Iolaus: an Anthology of Friendship.'

Carpenter, Esther Bernon, American prose-writer: b. Wakefield, R. I., 1848; d. 1883. She contributed to magazines; published 'The Huguenot Influence in Rhode Island'; and 'South Country Neighbors' (1887).

Carpenter, Francis Bicknell, American painter: b. Homer, N. Y., 6 Aug. 1830; d. New York, 23 May 1900. He studied with Sanford Thayer at Syracuse, N. Y. (1844), and in 1852 became an associate of the National Academy. Among his works are a portrait of President Fillmore, in the City Hall, New York; a portrait of President Lincoln, in the capitol at Albany, N. Y.; and the 'Emancipation Proclamation' (1864), in the capitol at Washington. While executing the last-named painting he was closely associated with President Lincoln, and his observations during this period are embodied in his book entitled 'Six Months in the White House with Abraham Lincoln.'

Car'penter, Frank George, American journalist: b. Mansfield, Ohio, 8 May 1855. He has been connected with various newspapers, and has made several important newspaper tours. He has published a series of geographical readers; 'Through Asia with the Children' (1898); 'Through North America with the Children' (1891); 'South America: Social, Industrial and Political' (1900).

Carpenter, George Rice, American literary critic: b. off the coast of Labrador, 25 Oct. 1863. He was graduated from Harvard University in 1886, and subsequently studied in Paris and Berlin. He was instructor at Harvard, 1888–90, professor of English in the Massachusetts Institute of Technology, 1890–3, and professor of rhetoric at Columbia University from 1893. He has written a 'Life of John Greenleaf Whittier' (1902); 'Elements of Rhetoric and Composition'; 'Life of H. W. Longfellow'; 'Principles of English Grammar.'

Carpenter, Gilbert Saltonstall, American military officer: b. Medina, Ohio, 17 April 1836. He was graduated at Western Reserve College in 1859; was admitted to the bar in 1861, and immediately afterward entered the Union army with the 19th Ohio Volunteer Infantry. Soon afterward he was transferred to the 18th United States Infantry, with which he served through the Civil War, in which he received the brevet of captain for gallantry in the battle of Stone River. Subsequently he rendered service in various Indian campaigns; was commissioned a brigadier-general of volunteers in the war with Spain in 1898; and became colonel of the 18th United States Infantry, 20 June 1899. His volunteer appointment was made in recognition of his gallantry at El Caney, Cuba. He retired in January 1900.

Carpenter, Henry Bernard, Irish Unitarian clergyman: b. Dublin, Ireland, 22 April 1840; d. Sorrento, Maine, 17 July 1890. He was a brother of William Boyd Carpenter (q.v.), bishop of Ripon, and was educated at Oxford University. He was for a time chaplain to the Earl of Belmore. He subsequently became a Unitarian, and coming to the United States in 1874 was pastor of the Hollis Street Church in Boston, 1878–87. He published 'Liber Amoris,' a volume of verse, and after his death a collection of his poems was edited by J. J. Roche (q.v.). He was a brilliant speaker and very popular as such.

Carpenter, Joseph Estlin, English Unitarian scholar: b. Ripley, Sussex, 5 Oct. 1844. He was educated at University College, London, and Manchester New College (now at Oxford). He was minister of Oakfield Road Church, Clifton, 1866–9, and of Mill Hill Chapel, Leeds, 1869–75, and is now vice-principal of Manchester New College, and Case lecturer on comparative religion there. He is one of the very foremost living authorities as a Sanskrit scholar and biblical critic, and besides editing Ewald's 'History of Israel' (Vols. III.–V.), and translating Tiele's 'Outlines of the History of Religion,' is the author of 'Life and Work of Mary Carpenter' (1879); 'Life in Palestine'; and 'The First Three Gospels: Their Origin and Relations' (1890). With Rhys Davids he has edited the 'Sumairgala Vilasini' (1886); and the 'Digha Nikaya' (1889). With Harford-Battersby he has also edited the Hexateuch according to the revised version.

Carpenter, Lant, English Unitarian clergyman: b. Kidderminster, 2 Sept. 1780; d. at sea, 5 April 1840. Designed for the ministry, he was sent in 1797 to the Northampton Academy. That school being temporarily discontinued, young Carpenter was placed at Glasgow College, where, however, he did not continue the length of time necessary to take his degree. Leaving college in 1801, he spent some time in teaching, and as librarian of the Athenæum, Liverpool. At Liverpool, Carpenter's views were so clearly in sympathy with those of the Unitarian denomination generally, that he received several invitations to the pastoral charge of Unitarian congregations, and a call to a professorship in

their college at York. In 1805 he accepted a call to Exeter, where he continued for 12 years. In 1806, the University of Glasgow gave him the degree of LL.D., although he had applied only for the degree of M.A. From Exeter he removed to the pastoral charge of the Unitarian congregation at Bristol (1817), where he continued until his death, which occurred by falling from a vessel between Naples and Leghorn, while on a tour for his health. Dr. Carpenter's piety was of an eminently practical turn. The instruction of children was an object of constant interest. Amid all his pastoral and literary labors he always found time and energies to devote to juvenile instruction, and, even against the prejudices of his congregations, established Sunday-schools among the children of Exeter and Bristol. In his pastoral charges at Exeter and Bristol, he was active in co-operation with others in the establishment of libraries, schools, savings banks, and institutions for general improvement and welfare. His published works are mainly theological and doctrinal, in support of the Unitarian sentiments he had early espoused. Among his more important works are 'An Introduction to the Geography of the New Testament'; 'Unitarianism the Doctrine of the Gospel'; 'Examination of the Charges Against Unitarianism'; 'Harmony of the Gospels'; and a volume of sermons. Mild in controversy, faithful in humane labors, and practically devoted to the improvement of society, Dr. Carpenter was greatly respected even by those who were his most staunch antagonists in theology.

Carpenter, Louis George, American engineer: b. Orion, Mich., 28 March 1861. He was graduated at Michigan Agricultural College in 1869, and after serving there as instructor in mathematics and engineering took post-graduate courses at the University of Michigan and Johns Hopkins University. In 1888 he became professor of engineering at the Colorado Agricultural College and meteorologist and irrigation engineer at the Agricultural Experiment Station, and organized the first course in irrigation engineering given in any American college. He founded the American Society of Irrigation Engineers in 1891. He has published Government Reports, 'Artesian Wells in Colorado' (1890); 'Irrigation Progress in Colorado' (1891).

Carpenter, Louis H., American military officer: b. Glassboro, N. J., 11 Feb. 1839. He entered the 6th United States Cavalry, and served in the Army of the Potomac through numerous engagements. He was an aide-de-camp to Gen. Sheridan; was commissioned colonel of volunteers in 1865, subsequently served in various Indian campaigns, became colonel of the 5th United States Cavalry in 1897, brigadier-general of volunteers in 1898, and brigadier-general, U. S. A., 18 Oct. 1899, for services in the Spanish-American war, and particularly as commander of the Department of Porto Principe, Cuba. He was retired 19 Oct. 1899.

Carpenter, Mary, English philanthropist: b. Exeter, 3 April 1807; d. Bristol, 15 June 1877. She was the eldest daughter of Lant Carpenter (q.v.). Her special work was for the neglected children of the poor and young criminals. She established a number of schools and reformatories, including the Red Lodge, a girls' school at Bristol, of which she was superintendent. She visited India in 1866, 1868, 1869, and 1875; and came to the United States and Canada in 1873, where she spoke on prison reform. She wrote 'Reformatory Schools for the Children of the Perishing and Dangerous Classes' (1851); 'Juvenile Delinquents' (1853); 'Our Convicts' (1864); and 'Six Months in India.' See J. E. Carpenter, 'Life of Mary Carpenter' (1879).

Carpenter, Matthew Hale, American legislator: b. Moretown, Vt., 22 Dec. 1824; d. Washington, D. C., 24 Feb. 1881. He studied at West Point, 1843–4; was admitted to the bar in 1845, and afterward studied under Rufus Choate. He removed in 1848 to Wisconsin, where he acquired a great reputation as a lawyer and orator. He was sent to the United States Senate from Wisconsin in 1869 and in 1879.

Carpenter, Rolla Clinton, American engineer: b. Orion, Mich., 26 June 1852. He was educated at the Michigan Agricultural College, the University of Michigan, and Cornell University; was professor in the Michigan Agricultural College, 1878–90, and later became professor of experimental engineering in Cornell. He has written 'Experimental Engineering'; 'Heating and Ventilation'; and numerous papers on engineering topics.

Carpenter, Stephen Cutter, American journalist: b. England; d. about 1820. He came to the United States in 1803, and settled in Charleston, S. C., where he founded and published with John Bristed the 'Monthly Register Magazine and Review of the United States.' Later he was editor of the 'Mirror of Taste and Dramatic Censor,' in which appeared some clever sketches of American actors. His works include: 'Memoirs of Jefferson, Containing a Concise History of the United States from the Acknowledgment of Their Independence, with a View of the Rise and Progress of French Influence and French Principles in that Country' (1809); 'Select American Speeches, Forensic and Parliamentary, with Prefatory Remarks, a Sequel to Dr. Chapman's Select Speeches' (1815); and under the pen-name of "Donald Campbell," 'Overland Journey to India' (2d ed, 1809–10), and 'Letter on the Present Times.'

Carpenter, William Benjamin, English physiologist and naturalist: b. Exeter, 29 Oct. 1813; d. 19 Nov. 1885. He was the eldest son of Lant Carpenter (q.v.); was educated in his father's school at Bristol, and in 1833 entered University College, London, as a medical student. Two years later he went to Edinburgh University, where he graduated as M.D. in 1839; and in that year also he produced his first important work, 'The Principles of General and Comparative Physiology.' In 1844 he was elected a Fellow of the Royal Society and also obtained the Fullerian professorship of physiology at the Royal Institution. From 1847 till 1852 he was editor of the 'British and Foreign Medico-Chirurgical Review,' and in 1856 he was appointed registrar of the University of London, a post which he resigned in 1879. He wrote several well-known works on physiology, one of which has been already referred to. Others are: 'Principles of Mental Physiology' (4th ed. 1876); and 'Principles of Human

Physiology' (1846, new edition by H. Power 1881). Still other works of his are: 'Introduction to the Study of the Foraminifera' (1862); 'The Microscope and Its Revelations' (1868, 6th ed. 1881); 'The Physiology of Temperance and Total Abstinence' (1853); besides many papers in scientific journals. He took a leading part in the expeditions sent out by government in 1868–70 for deep-sea exploration in the North Atlantic, and was chosen president of the British Association at Brighton in 1872.

Carpenter, William Henry, American philologist: b. Utica, N. Y., 15 July 1853. He received a university education in the United States and Europe, became instructor in rhetoric and lecturer on North European literature in Cornell University in 1883, instructor of German and Scandinavian languages in Columbia University, adjunct professor of Germanic languages and literature in the same institution in 1890, and subsequently professor of Germanic philology there. He has published several works in the line of his specialty.

Carpenter-bee, a species of bee (*Xylocopa virginica*) which burrows into dead tree-trunks, lumber, and even into woodwork of buildings. It is a large, black-bodied bee, as big as the biggest bumblebee. Its burrow is about half an inch in diameter, runs horizontally across the grain of the wood for a short distance, then forms a tunnel at right angles to this entrance, running sometimes 12 to 18 inches. When the tunnels are complete, the cells are made and supplied with pollen. The cells are about seven eighths of an inch long, and are separated from each other by partitions made of sawdust glued together. When the eggs, which are laid one in each cell, are hatched, the larvæ feed on the pollen-deposit until they are ready to bore their way out. The carpenter-bee will use the same burrow again and again, and its home is sometimes utilized by other species of bees.

Car'penters' Hall, Philadelphia, on the south side of Chestnut Street between Third and Fourth. It was built shortly after 1770 (as an assembly house and club) for the carpenters' guild of that city, and probably for civic uses if desired. In 1774 it became famous as the chosen meeting-place of several conventions for the liberation of the colonies. The first was on 15 July, when the committee of correspondence of the colony appointed a session of committees from each county, as "the most effective means toward a union." Later, on 5 September, the first Continental Congress met in its "plain but spacious rooms" on the lower floor, although the State house had been offered them. Behind its closed doors were prepared the papers which Chatham said ranked with the greatest of the world. The second Congress also began its sessions there, 10 May 1775.

Carpentras, kär-päṅ-trä, France, a town of the department of Vaucluse, situated 14 miles northeast of Avignon. In Roman times it was known as Carpentoracte, was a place of importance, and possessed many handsome edifices, of which a few traces are left. The principal structures are an aqueduct, which crossed the valley of the Auzon by 48 arches; a Roman triumphal arch, a Gothic cathedral, and the library. Carpentras has a considerable local trade, and weekly markets, which are among the most important in southern France. It was formerly the seat of a bishopric, and Pope Clement V. had his residence there in 1313.

Carpentry, the art of combining pieces of timber to support a weight or sustain pressure. The work of the carpenter is intended to give stability to a structure; that of the joiner is applied to finishing and decoration. The scientific principles of carpentry are founded on the doctrines of the composition and resolution of mechanical forces, and a knowledge of these doctrines, either theoretical or practical, is indispensable to the skilled carpenter. To go into the principles of the art would be merely to explain a particular application of these mechanical forces, which would be beyond the scope and limits of this work. An explanation of the terms employed in carpentry may, however, be useful to the general reader. The term "frame" is applied to any assemblage of pieces of timber firmly connected together. The points of meeting of the pieces of timber in a frame are called "joints." "Lengthening" a beam is uniting pieces of timber into one length by joining their extremities. When neatness is not required this is done by "fishing." In this mode the ends of the beams are abutted together, and a piece of timber placed on each side and secured by bolts passed through the whole. Sometimes the parts are indented together, and pieces termed "keys" are notched into the beams and side pieces. When it is desirable to maintain the same depth and width throughout the beam "scarfing" is employed. This is cutting from each beam a part of the thickness of the timber, of the length of the intended joint, and on opposite sides, so that the pieces may be jointed together, and bolted or hooped. In bolting scarfs, side plates of iron are used to protect the wood. When greater strength is required than can be produced by a single beam, "building" and "trussing" beams are resorted to. Building beams is combining two or more beams in depth so as to have the effect of one. In trussing the beam is cut in two in the direction of its length, and supported with cross-beams, as in roofing. "Mortise" and "tenon" is a mode of jointing timber. An excavation called a mortise is made in one piece, and a projecting tongue to fit it, called a tenon, in the other. The tenon is confined in the mortise by a pin penetrating it laterally through the side of the mortised beam, or by an external strap of iron passing round the mortised beam and rivetted in the one terminating in the tenon. The timber frame-work of floors is called "naked flooring." It is of three kinds — single, double, and framed. Single flooring consists of a series of joists stretching across the whole void from wall to wall, without an intermediate support. The flooring boards are laid on the top of these, and the ceiling of the lower story fixed to the under side. Double flooring consists in laying binding joists across the floor about six feet apart, crossed above by bridging joists, and also crossed below by the ceiling joists. Framed flooring is provided with girders or beams in addition to the binding, bridging, and ceiling joists. To prevent the transmission of sound, a double ceiling of lath and plaster is sometimes used, but generally pugging is inserted between the roof and the cealing. "Cornice bracketing" consists in rough wooden pro-

files of the room cornices, which are afterward lathed round and plastered. Partitions, when not required to bear weight, are formed by laying along the floor a piece of timber called a "sill," together with a corresponding piece along the ceiling joists, the space within being filled with vertical pieces called "quarters," to which the lath is nailed. When the partition has weight to support, it has to be trussed with posts and braces. The timbers which support the steps of a wooden staircase are termed the "carriage." They consist of two pieces of timber inclined to the "rake," or projection of the steps, and termed "rough strings," which may rest upon a piece of timber projected horizontally from the upper wall, called a "pitching" or "apron" piece, which also supports the joists of the landing or "half pace." The "roof" is the framework by which the covering of a building is supported. It may consist of a series of pieces of timber with their one ends resting on the opposite walls, and their other ends meeting in a point, which are called "rafters." When loaded with the weight of the covering, this framework would be apt to thrust out the roof; a third piece is consequently added, which, like a string, connects the lower extremities of the rafters and prevents them from spreading. This is called a "tie," and the whole frame a "couple." When the tie is of such a length that it is apt to droop in the middle, or "sag," by its own weight, a fourth piece is added to unite it directly with the apex of the rafters; this is called the "king-post." If the rafters, too, are liable to sag, cross pieces called "struts" are introduced, uniting their centres with the centre of the tie. Instead of the king-posts and struts, the centre of each rafter may be joined to the tie by a piece falling perpendicularly on the latter, and to each other by a piece running across parellel to and above the tie, forming a parallelogram with the perpendiculars and the section of the tie enclosed by them. The suspending pieces are called "queen-posts," and the horizontal one a "collar-beam." The whole frame, constructed in either way, is called a truss. The trussed frames are placed at intervals of about 18 feet apart, and support horizontal pieces called "purlins," which run the whole length of the roof and support the common rafters with their covering.

The principal instruments used in carpentry are saws, as the circular-, band-, and tenon-saws; planes, as the jack-plane, smoothing-plane, molding-plane, etc.; chisels, gouges, brad-awls, gimlets, descriptions of which will be found in their places.

Carpet (Lat. *carpere,* to "pluck" or "card," as wool), a thick woolen fabric used for covering floors. The word originally meant (in old French) a coarse cloth in which packages were wrapped for packing upon the backs of men and animals. As man advanced in civilization and desire for comfort, he began to use his packing *carpite* as a wrap for himself and to cover his feet and limbs at night. From that he began to use it to protect his sandaled feet from cold stone floors. Then the material was made finer and gradually embellished with colors and designs. The art progressed most rapidly in the cold mountain districts of western Asia — Persia, Turkey, Syria.

The art of carpet-making in its best sense still remains with the Orient. Some of the Indian carpets approach the fineness of those of Persia. Very high prices have often been obtained for some of these Oriental weaves.

Carpet Industry in America. A hundred years ago very few woolen carpets were in use in America. A few wealthy people had Turkish rugs, and some ingrains were imported; but they were so rare that children were cautioned to tread lightly on them when permitted on state occasions to enter the carpeted room. No carpets were made in America except "rag carpets" — the striped combination of rags and list which the housewives wove at home, and which are still made in small quantities both in farm-houses and in factories. The first carpet dealers in New York of whom we know anything were J. Alexander & Company, whose advertisement in Parker's *New York Gazette;* or *The Weekly Post-Boy,* on Monday, 30 June 1760, read as follows:

"J. Alexander & Company have removed their store to Mr. Haynes's house on Smith St., where Mr. Proctor, watch-maker, lately lived, where they sell Check Handkerchiefs, linens of different kinds, Lawn and Minonets, Scot's Carpets, broad and narrow cloths, Shoes of different kinds, made shirts, Hats, Stockings, with several other goods; Eine's Scot's barley and Herrings. Also a choice parcel of Old Madeira in Pipes."

In the following year they offered for sale Turkey carpets, and two years later state that they "have imported some English and Scot's carpets and Hair Cloth for Stairs and Passages." They were then located "in the house right opposite Mr. Donald Morison Ship Chandler House, betwix the Fly and Burling Slip." Judging from their advertisements in the papers of the day, they were not only the pioneers in the carpet business, but also the originators of the modern department store. From this time on the use of carpets began to increase and the business to grow, until, according to the city directories, there were lately over 300 firms engaged in the sale of carpets in New York and Brooklyn, the amount of capital invested being many millions. It was not until many years after carpets were first used in the colonies that the manufacture was introduced here, and the colonies had then become the United States. In 1791 William Sprague began to make Axminsters in Philadelphia. One of his first productions was a pattern which represented the coat-of-arms of the young republic. The carpet was probably not wonderful, but it has achieved fame, not so much on account of the fact that it was our first attempt, as because it was the first article to which the principle of tariff protection was applied. Alexander Hamilton was secretary of the treasury, and in a report on manufactures sent to the House of Representatives in 1791, he recommended that a duty of two and a half per cent be laid on carpets. To quote his own words: "To which the nature of the articles suggests no objection, and which may at the same time furnish a motive the more to the fabrication of them at home, toward which some beginnings have been made." (5 Dec. 1791.) The proceeds of this duty he proposed to use as a bounty to encourage the growth of wool in the United States.

Early in the century the manufacture of ingrain carpets was begun, and has continued steadily increasing in amount ever since. Probably the first ingrain mill in the United States was that of George M. Conradt, who came to this country from the kingdom of Würtemberg, and settled in Frederick County, Maryland. The factory was a stone building, and was still standing not many years ago. The carpets were made in a hand-loom on a drum having rows of pegs somewhat like the cylinder of a music-box. This drum worked the harness. Jacquard's great invention was made in 1800, and soon after began to be applied to the weaving of carpets in this country. Among the early mills was one owned by Henry Burdett, at Medway, Mass. Alexander Wright was the superintendent, and the concern is notable as having been the starting-point of what became later the great corporation known as the Lowell Manufacturing Company, whose carpets afterward were the standard goods of the country. In 1825 Wright endeavored to gain information touching the jealously guarded secrets of the Jacquard machine, then in use in the manufacture of ingrains in Philadelphia, which city seems to have been the second starting-point for the manufacture of ingrains. He was unable to gain access to the mills, and sailed for Scotland, whence he soon returned with the best looms he could procure. He also brought over with him William and Glaude Wilson, to aid in operating the machinery. Glaude Wilson was a skilled mechanic, and devised improvements in the Jacquard loom, simplifying its construction and rendering it more certain in operation. He resided many years in Lowell, and lived to see the Lowell Company become one of the most important manufacturing establishments in the country.

While the Medway experiment was going on, a charter had been granted to the Lowell Manufacturing Company, and on 22 Feb. 1828 its organization was completed. In those days directors' meetings were held at seven o'clock in the evening. Whitney, Cabot & Company were appointed to build the mills, employ the labor, and afterward sell the goods. The Medway mill and machinery were sold to the Lowell Company, which kept the looms in operation in that place until its own factory at Lowell was finished. Alexander Wright, referred to above, was the first superintendent. For a long time the enterprise was regarded as an experiment and many believed that the demand for carpets would not justify paying for the skill necessary to make them. The hand-looms of those days were by no means as perfect as the hand-looms of our time. The Lowell Company, however, persevered, and ingrain factories continued to spring up in various parts of the country. The progress was slow, and with the exception of the Hartford Carpet Company, then operating as two separate concerns, very few of the firms which afterward became famous started until many years later.

E. S. Higgins & Company began to manufacture ingrains in New York in 1841. Alexander Smith began at West Farms in 1844. Robert Beattie started in New York in 1840. John Bromley did not set up his looms in Philadelphia until 1845. Philadelphia has now some of the finest factories in existence, and its production is larger than that of all the rest of the country combined. More yards of ingrain carpets are made there than in any other city in the world, and the goods range from the highest to the lowest grade. The imports from England and Scotland continued to be heavy in spite of distance and duties, as up to 1850 hand-looms only being in use, the product of these and the other mills using these looms was necessarily very limited, and we had to overcome the prejudice against domestic goods.

Meanwhile Alexander Smith and J. G. McNair had devoted much time and labor to the invention of a patent process for weaving tapestry ingrains. They succeeded in producing a carpet which filled a want of the times for a strong and durable fabric in which a large variety of color could be introduced. The Crossleys, of Halifax, England, purchased the rights to the invention, paying a royalty of a penny a yard for England. Templeton, of Ayr, paid £200 and a like royalty for Scotland. The goods become enormously popular, and Stephen Sanford, of Amsterdam, N. Y., also secured the right to manufacture them. The fame of the carpets spread so rapidly that it did much to stop the importation of foreign ingrains.

Erastus B. Bigelow (q.v.), a young medical student of Boston, who was but 20 years of age, had seen somewhere the manufacture of coach-lace by hand. He was without mechanical training; and, in fact, had never read a book on the subject; but in 40 days after he took up the idea he perfected a power-loom by which coach-lace weaving could be done. At a single stroke he so reduced the cost of weaving this class of goods that what had previously cost 22 cents a yard was reduced to three cents. This invention brought him into notice, and he set to work to devise a power-loom for ingrain-carpet weaving. Before the year was out he succeeded. At this time eight yards a day was the product of the ingrain hand-loom. Mr. Bigelow's loom at once increased the product to 10 and 12 yards, and, after some defects had been remedied, rolled it up to 25 yards a day, thus stimulating successive inventors of power-looms, such as Duckworth, Murkland, Crompton, and others, who have multiplied the result, so that the product now reaches to from 40 to 45 yards a day, although the hours of labor have been materially shortened.

But Mr. Bigelow did not rest here. In 1848 he set to work to invent a power-loom for the weaving of Brussels and tapestry carpets. At this time the product of a long and hard day's labor for a weaver, including a boy to draw the wires, was seven yards of Brussels carpet. At once Mr. Bigelow raised this to over 25, some modern machines now getting 55 yards of production in a day. Prior to the perfecting of this invention, he had, with his brother, Horatio N., organized the Bigelow Carpet Company, which has the honor of being the original power-loom manufacturer of Brussels and Wilton carpets. The company has been very successful, and now ranks among the foremost concerns in the world. The Crossleys of England, promptly purchased, at a cost of £20,000, the right to use the Bigelow loom in England; and A. & E. S. Higgins, of New York, and the Roxbury Carpet Company, of Massachusetts, also secured the exclusive use for the United States for tapestry and velvet during the term

of the patent. Mr. Bigelow, of course, reserved the right to manufacture Wiltons and Brussels on his own loom. It has been my experience, in a connection of over 30 years with the trade, that the Wiltons, velvets, Brussels, and tapestries made at that day by these establishments would compare favorably in durability of wear and stability of color with the same grades of any country in the world.

The success of Mr. Bigelow's looms stimulated others to like inventions. The manufacture of Axminster and moquette carpets by hand in foreign countries was one of the slowest of trade processes. In this two men and a boy were employed at one loom, and could make but one and a half yards of French moquette in a day. In 1860 Alexander Smith and Halcyon Skinner, of Yonkers, invented an Axminster and moquette power-loom which was perhaps more striking in its ability to increase the productive capacity of labor than was that of Mr. Bigelow.

This was the beginning of a second era in the trade. The invention increased the production to about 11 yards per day, the loom being attended by a girl. Its merits were universally conceded, and foreign and domestic manufacturers were glad to pay large royalties for its use. The Alexander Smith & Sons Carpet Company became one of the most famous in the world, and its plant in Yonkers is to-day the largest of the kind in the country. How thoroughly American invention and American mechanical skill have gained control of the home market can easily be understood from a few figures which I present:

In the year ending 30 June 1870 there were entered at the port of New York alone body Brussels and tapestry Brussels valued at $1,355,832; in 1900 there were imported in the entire United States body Brussels and tapestry Brussels valued at less than $60,000. In 1870 the manufacture of carpets in the United States amounted in value to $21,761,573; in 1900 the value of the carpets made in the United States was over $50,000,000.

The number of firms engaged in the various departments, with the approximate number of power-looms employed (1902) was as follows:

PRODUCTION OF CARPETS.

Varieties	Manufacturers	Power-looms
Ingrains	89	4,800
Brussels and Wilton	16	1,200
Tapestry and Velvet	14	1,700
Axminster	6	600

These firms were capable of producing 100,000,000 yards, of the value of $50,000,000. There are also many hand-looms on ingrains, and many manufacturers of damasks and Venetians, Smyrna and other rugs and mats.

On the artistic side the improvement has been equally great. At the outset most of our designs were copied or adapted from foreign patterns. It was only a few years ago that a foreign manufacturer, to whom I showed a sample of the first piece of tapestry produced by Stephen Sanford, remarked, after examining the fabric closely, "Well, you may be able to manufacture the goods, but you can't design them." In less than five years from that time, the same gentleman, on his way to Canada to sell goods, proposed to me to exchange samples, that he might take orders from the American patterns. After looking through his line, I thanked him, with the assurance that I could find nothing there that could compare favorably with the discarded designs of last season's patterns of our domestic manufacture. In the fully equipped studios of the Bigelow, Lowell, Smith, Hartford, Higgins, and the Philadelphia companies a large proportion of the designers are Americans, and the proportion is steadily increasing. The American dealer of to-day has to overcome very little prejudice against either the fabric, color, or pattern of American carpets, and it is long since I have heard a customer ask, "Is it English?"

Were I able to give the exact amount of money expended each year, from the time the wool leaves the sheep's back until the carpet reaches its resting-place upon the floor of our homes, to be trodden upon, beaten, and sometimes abused, notwithstanding the fact that there is no article which goes so far to make the home comfortable and attractive, the figures would be astonishing. The people employed in designing, manufacturing, and selling this article to-day would form a sufficient population for a young republic, with abundant capital to carry on the government.

The skill and inventive genius in carpet manufactories have so built up the home industry of the United States as to give employment to a vast army of operatives, and reduced the cost of the manufactured article to such an extent that the humblest citizen is enabled to have a floor well carpeted with fabrics that are attractive, and even artistic; and, with the thrifty housewife, the addition of a rug or two upon the carpet and a good lining underneath is necessary, in her estimation, to sustain her status as one of the social leaders in her humble sphere.

In no other time and no other country has such comparative luxury been within the reach of modest means. The white and well-scrubbed floor of the Holland frau, the polished oak and tiling of France, Germany, Italy, Austria, and the other countries of continental Europe, have given no precedent for the American indulgence in carpets; and even England, outgrowing the rush- and straw-strewn floors of the time of Erasmus, has not yet learned to fill the great gap between the velvet pile carpets of the homes of the nobility and the bare boards of the White-chapel tenements. It is in this respect that the United States stands forth pre-eminent. There are carpets for all, and from the days when the grandmothers wove their rag carpets, to the present, when a far superior article is turned out from nearly every factory in the country, at a cost cheaper even than that of the home-made article, there have been few American homes too poor to enjoy the comfort of neat and pretty floor coverings.

SHEPPARD KNAPP,
Of Sheppard Knapp & Co., New York.

Carpet-baggers, Carpet-bag Governments. The admission of the southern negroes to the franchise after the war involved their organization and leadership, and their representation in State and national offices by intelligent whites. As no southern whites of character would undertake what they regarded as a crusade against civilization, the task fell to northern Republicans. Those who undertook it were of all grades of personal integrity and honesty of purpose, from sincere old-fashioned abolitionists

to mere scalawag adventurers; but they had one characteristic in common: the lack of property interests in the South to make its injury theirs. Hence the name, implying that their only possessions there were in their carpet-bags. The name was at first given only to those whose one motive for residence there was election to office from thence; and the purpose of many was voiced in the utterance of one high official, that when he could no longer hold office from there he would no longer live there. But the régime of monstrous plunder and social and industrial ruin which the system brought on, the levying of fraudulent taxes, and the piling up of huge State debts for the future, soon effaced all distinctions. All Northerners who upheld the system or tried to protect the negroes' voting rights were confounded under the name; all State governments in any way protected from overthrow by United States troops were "carpet-bag" governments; and finally the entire years of Reconstruction, and that attempt itself, are compendiously known as the "Carpet-Bag Régime."

Carpet-beetle, a small beetle (*Anthrenus scrophulariæ*), often wrongly called "buffalo-bug." In the grub or larval state, it is injurious to carpets and similar fabrics. It is an active, brown, hairy larva, the size of a grain of wheat, which works in a hidden manner from the under surface, sometimes making irregular holes, but more frequently following the floor-cracks and cutting long slits in a carpet. This insect was brought from Europe about 1874, and is abundant in the New England States and westward to Kansas. The adult insect is a minute, broad-oval beetle, about three sixteenths of an inch long, with a red stripe down the middle of the back. When disturbed it folds up its limbs and feigns death. As a general thing the beetles begin to appear in the autumn, and continue to issue, in heated houses, throughout the winter and following spring. Soon after issuing they pair, and the females lay their eggs in convenient spots. The eggs hatch in a few days, and the larvæ develop rapidly. Their development is retarded by cold weather or by lack of food, and they may remain alive for an indefinite period. When, under normal conditions, the larva reaches full growth, the yellowish pupa is formed within the last larval skin, from which the beetle emerges later. The beetles are day-fliers, and when not engaged in egg-laying are attracted to the light. They fly to the windows, and may often be found upon the sills or panes. The carpet beetle is very difficult to exterminate, and the best preventative is the use of movable rugs on hard-wood floors. Suspected carpets should be taken up, beaten, sprayed out of doors with benzine, and then be well aired. Before relaying the carpet, tarred roofing-paper should be laid upon the floor.

Another similar pest is the black carpet-beetle (*Attagenus piceus*), whose larva is readily distinguished from the buffalo-bug by its cylindrical shape and lighter color. It is not so fond of working in cracks and cutting long slits in carpets, and in general is not so dangerous a species as the other. It sometimes produces in feather-beds a peculiar felting of the ticking. It has also been known to infest flour-mills, and is to a certain extent a feeder upon cereal products. Two years are required for its development from egg to beetle. Consult Howard and Marlatt, 'Household Insects' (U. S. Department of Agriculture, Washington, 1896).

Carpet-snake, a python (*Python spilotes*) of Australia and New Guinea, which takes its name from the rich variegation of its colors, which are mainly black with yellow spottings. It spends most of its time in trees, and reaches a length of six feet. See PYTHON.

Carpi, Girolama da, jē-rō'lä-mō dä kär'-pē, Italian painter: b. Ferrara; d. 1556. He painted many pictures for the churches of his native place, and at Bologna, and was a great admirer of Correggio and Parmegiano, whose works he copied with great success.

Carpi, Ugo da, oo'gō dä, Italian wood-carver: b. Carpi, 1455; d. 1523. He is generally considered as the inventor of that species of carving denominated *chiaroscuro.* He was preceded in the art by Albert Dürer and Lucas Cranach (q.v.).

Carpi, kär'pē, Italy, a town in the province of Modena and nine miles north of the city of Modena. It is the seat of a bishopric, suffragan to Bologna. It is surrounded by walls, defended by a citadel, and has a cathedral, a seminary, and manufactures of straw hats and spun silk. The neighborhood produces rice, wheat, hemp, and flax. Pop. about 6,000.

Carpio, Bernardo del. See BERNARDO DEL CARPIO.

Carpio, Manuel, mä'noo ĕl kär'pē-ō, Mexican poet and politician: b. Casamaloapan, 1 March 1791; d. 11 Feb. 1860. He studied medicine and became professor of physiology in the University of Mexico, and entering political life he became a leader of the Conservatives. In 1825 and 1848 he was deputy, in 1851 senator, and in 1853 councilor of state. Several editions of his 'Poesias' have been published, the latest in 1883.

Carpoc'rates, a native of Alexandria, who in the 2d century revived several Gnostic errors. He rejected the Old Testament and the gospels of St. Matthew and St. Luke; denied the resurrection of the dead, and advocated the most licentious mode of life. Mosheim calls him "the worst of all the Gnostics."

Car'polites, a term applied to fossils of the nature of fruits, usually found in the Carboniferous system. Their exact place in the vegetable kingdom has not yet been determined.

Car'pophore, a stalk bearing the pistil, and raising it above the whorl of the stamens, as in *Passiflora.* Also applied to the stalk between the achenes of *Umbelliferæ.*

Carpus, in anatomy, the bones between the forearm and hand, the wrist in man, or corresponding part in other animals. See HAND.

Carpzov, kärp'tsŏf, the name of a German family which has furnished several eminent jurists and theologians. The founder of the family was Simon Carpzov, burgomaster of Brandenburg, in the middle of the 16th century. He had two sons: Joachim, who at his death at Glückstadt in Holstein, in 1628, was commander-in-chief of the Danish army; and Benedict, b. 1565; d. 1624. He was appointed professor of law at Wittenberg in 1595, became chancellor of

the Dowager-electress Sophia at Kolditz, but afterward returned to Wittenberg. A second Benedict, son of the former, b. Wittenberg 1595; d. 1666; became assessor of the supreme court and professor of law at Leipsic in 1645, then councilor of the court of appeal and member of the privy-council at Dresden. He was one of the most eminent jurists of his day, and is the author of several valuable legal works; but is justly censured for the severity and cruelty of his proceedings. He is said to have signed the death-warrants of not fewer than 20,000 persons. JOHANN BENEDICT CARPZOV, his brother (b. Rochlitz, 1607; d. 1657); became professor of theology at Leipsic, and is famed as the author of the 'Systema Theologicum' (1653). He left five sons, one of whom, JOHANN BENEDICT (b. 1639; d. 1669), became professor of theology and pastor of St. Thomas' church at Leipsic, distinguished himself by his knowledge of Hebrew language and literature, and translated several rabbinical works. Another member of the family, JOHANN GOTTLIEB CARPZOV, born at Dresden in 1679, became professor of Oriental languages at Leipsic, and died as superintendent at Lübeck in 1767. He was one of the most eminent theologians of his time, and wrote, among other treatises, 'Critica Sacra Veteris Testamenti' (1728); 'Introductio in Libros Canonicos Veteris Testamenti.'

Carquinez, kär-kē'nĕs, or **Karquenas,** a strait between Contra Costa and Salano counties, California; its greatest width is two miles and its length seven miles; it is navigable, and connects the bays of San Pablo and Suisin.

Carr, Dabney, American colonial politician; d. May 1773. He was a member of the house of burgesses of Virginia, and moved and eloquently supported a resolution to appoint a committee of grievances and correspondence, in consequence of British encroachments. His resolution was adopted, 3 March 1773. He married a sister of Jefferson, by whom he is described as a man of sound judgment and inflexible purpose, mingled with amiability, and of a fanciful eloquence.

Carr, Eugene Asa, American army officer: b. Concord, N. Y., 20 March 1830. He was graduated at the United States Military Academy in 1850, and joined the Mounted Rifles. He accompanied the Sioux Expedition in 1855, and was active in suppressing the insurrections on the Kansas border in 1856. In 1860 he was engaged in a campaign against the Comanche Indians. He was in active service throughout the Civil War, commanding the 4th Division of the Army of the Southwest, and subsequently acting as commander of the same army. He commanded a division in the Vicksburg campaign in 1863, and led the assault on the works of that city, 18 May. In December 1863 he was assigned to the Army of Arkansas. At the close of the war he was promoted to brigadier-general, U. S. A., and brevetted major-general of volunteers. In 1868–9 he was engaged against the Sioux and Cheyenne Indians, and afterward took part in other expeditions against hostile Indians. He fought in 13 engagements with Indians, was four times wounded in action, and received a congressional medal of honor and the thanks of the legislatures of Nebraska, Colorado, and New Mexico. He was retired in 1893.

Carr, Frank Osmond, English composer: b. near Bradford, England, 23 April 1858. He was educated at Cambridge University from which he received the degree of doctor of music in 1891. He has furnished the music to the opera librettos of 'Faddimir,' 'Joan of Arc,' and 'Out of Town,' by Arthur Reed Ropes (q.v.), and also that for W. H. Gilbert's opera, 'His Excellency.'

Carr, Henry Lascelles, English journalist: b. Knottingly, Yorkshire, 1841; d. 5 Oct. 1902. He was educated for the Anglican priesthood at St. Aidan's Theological College, Birkenhead, but after qualifying for orders decided upon a literary career. After being for some time on the staff of the Liverpool *Daily Post,* he removed to Cardiff, where he was successively sub-editor, manager, editor and part proprietor of the *Western Mail.* He retired in 1901. He published 'Yankee Land and the Yankees'; 'Letters from the United States of America.'

Carr, Joseph Bradford, American military officer: b. Albany, N. Y., 16 Aug. 1828; d. Troy, N. Y., 24 Feb. 1895. He joined the militia in 1849, and rose to the rank of colonel. In 1861 he was appointed colonel of the 28th New York Volunteers, and led them at the battle of Big Bethel and in McClellan's Peninsular campaign. He took part in the battles of Chancellorsville and Gettysburg, and for his bravery throughout the war he was brevetted a major-general of volunteers. After the war he became prominent in Republican politics in New York State, and was elected secretary of state in 1879, 1881, and 1883. In 1885 he was an unsuccessful candidate for lieutenant-governor.

Carr, Joseph William Comyns, English art critic and dramatist: b. 1849. He was educated at London University and was admitted a barrister of the Inner Temple in 1869. He has been English editor of 'L'Art' and art critic of the 'Pall Mall Gazette.' He has published 'Drawings by the Old Masters' (1877); 'The Abbey Church of Saint Albans' (1878); 'Examples of Contemporary Art' (1878); 'Essays on Art'; 'Papers on Art'; 'A Fireside Hamlet'; 'The United Pair'; 'The Naturalist'; 'The Friar'; 'Forgiveness'; 'King Arthur.'

Carr, Lucien, American archæologist: b. Lincoln County, Missouri, 1829. He received a collegiate education and from 1876 to 1894 was assistant curator in the Peabody Museum. He has written 'Mounds of the Mississippi Valley' (1883); 'Missouri, a Bone of Contention' (1888); 'Prehistoric Remains of Kentucky' (with N. S. Shaler).

Carr, or Ker, Robert, VISCOUNT ROCHESTER, EARL OF SOMERSET, a British politician: b. Scotland; d. July 1645. He followed James I. to England when that monarch became Elizabeth's successor. James chose him as his chief favorite and adviser, knighted him, gave him a seat in the House of Lords, and assisted him in his schemes for a marriage with Lady Essex. The latter after procuring a divorce was married to the earl, and in 1615 the couple were tried for the murder of Sir Thomas Overbury. They were condemned to death but pardoned.

Carr, SIR Robert, British commissioner in New England: b. Northumberland; d. Bristol, England, 1 June 1667. He was appointed to that office by Charles II. in 1664, in conjunction

with Nicolls, Cartwright, and Maverick. In 1664, Nicolls and Carr captured New Amsterdam from the Dutch, calling it New York, in honor of the king's brother, the Duke of York, afterward James II. Carr forced the Swedes and Dutch on the Delaware into a capitulation. He returned to Boston in 1665, and, in conjunction with his coadjutors, assumed the principal powers of government.

Carracci, or **Caracci, Agostino,** ä-gōs-tē'-nō kär-rä'chē, Italian artist: b. Bologna 1558; d. Parma 1602. One of a family of artists who founded the Bolognese or Eclectic school of painting. He was a brother of Annibale Carracci, and distantly related to Lodovico Carracci, under whose guidance he studied art. He attained great mastery in engraving, and engraved more pieces than he painted, in order, it is said, to please his brother Annibale, who became envious of his fame after one of Agostino's pictures had obtained a prize in preference to one of his own, and another excellent picture — 'The Last Communion of St. Jerome' — had gained his brother universal admiration. In 1600 Agostino accompanied Annibale to Rome, and assisted him in painting the Farnesian Gallery. As many persons said that the engraver worked better than the painter, Annibale removed his brother, under the pretext that his style, though elegant, was not grand enough. Agostino went then to the court of the Duke of Parma, and painted there a picture representing the heavenly, the earthly, and the venal love. There was only one figure wanting when, exhausted by labor and mortification, he died. He wrote a treatise on perspective and architecture. As an engraver he deserves great praise, and often corrected the imperfect outlines of his originals.

Carracci, Annibale, än-nē-bä'lē, Italian painter: b. Bologna, 1560; d. Rome, 1609. He worked first with his father, who was a tailor. By the advice of Lodovico Carracci he learned drawing, and made the most astonishing progress, copying first the pieces of Correggio, Titian, and Paul Veronese, and painting, like them, small pictures, before he undertook large ones. In the academy founded by the Carracci he taught the rules of arrangement and distribution of figures. He is one of the greatest imitators of Correggio. His 'St. Roque Distributing Alms,' now in Dresden, was the first painting which gave him reputation. His 'Genius of Glory' is likewise celebrated. In the Farnesian Gallery at Rome, which he, aided by his brother Agostino, painted (1600–4), there breathes an antique elegance and all the grace of Raphael. You find there imitations of Tibaldi (who painted at Bologna about 1550 with Nicolo del Abate), of Michael Angelo (the style, indeed, somewhat softened), and the excellencies of the Venetian and Lombard schools. Outside of Bologna he is acknowledged as the greatest of the Carracci. In that city, however, Lodovico is more admired. Agostino, perhaps, had more invention, and Lodovico more talent for teaching; but Annibale had a loftier spirit, and his style is more eloquent and noble. He was buried at the side of Raphael in the Pantheon. His best picture is that of 'The Three Maries,' now at Castle Howard, in Yorkshire, England.

Carracci, Lodovico, lō-dō-vē'kō, Italian painter: b. Bologna, 1555; d. 1619. He was the eldest of the three Carracci, and is regarded as the chief founder of their school. He was the son of a butcher, and appeared at first to be more fit for grinding colors than for transferring them to canvas. But his slowness did not arise from deficiency of talent, but from zeal for excellence. He detested all that was called ideal, and studied only nature, which he imitated with great care. At Florence he studied under Andrea del Sarto, and enjoyed the instruction of Passignano. He went to Parma for the purpose of studying Correggio, who was then imitated by almost all the Florentine painters. At Bologna he endeavored to gain popularity for his new principles among the young artists, and united himself with his relatives, Agostino and Annibale Carracci, whom he sent in 1580 to Parma and Venice. In 1589 they established an academy for painters at Bologna, called the Academia degli Incamminati (from *incamminare,* to put in the way), which they directed jointly till 1600, the year of the departure of Agostino and Annibale for Rome. From that time till his death Lodovico was sole director. The academy was so successful that similar institutions in Bologna had to be closed. Among his most famous pupils were Domenichino and Guido Reni. His first principle was, that the study of nature must be united with the imitation of the best masters. He soon gave an example of this principle in his 'Prophecy of John the Baptist,' in the monastery of the Carthusians, imitating in single figures the style of Raphael, Titian, and Tintoretto. The finest works of Lodovico are in Bologna, especially in the picture gallery or *Pinacoteca,* and among them are 'The Annunciation'; 'The Transfiguration'; and 'St. George and the Dragon.' He excelled in architectural views and in drawing, and in general was very thorough in all the branches of his art. He also executed several fine engravings.

Carrageen, kär'ra gēn, **Carragheen,** or **Irish Moss,** a name applied to several species of marine algæ found abundantly near Waterford, Ireland, at a place called Carragheen, from which the name is derived. It abounds also on the rocks in other localities in Great Britain and Ireland, and is found on the east coast of North America. The species from which the carrageen of commerce is chiefly derived is a seaweed called *Chondrus crispus.* The frond is thick, cartilaginous, somewhat fan-shaped, and repeatedly forked; color, various shades of purple or green. It is gathered from the rocks, washed, bleached in the sun, and dried, and is then the Irish moss of commerce. In hot water it swells up, and on boiling it dissolves. The results of the analysis of Irish moss are somewhat discordant; but the main constituent is a mucilage, which differs from gums, starches, and jellies by not giving their characteristic reactions. It is nutritious, and is substituted for animal jelly and starches in the preparation of soup, jellies, creams, and similar dishes. It is of value in pulmonary troubles, and is also used by painters and others in the preparation of size. It is sometimes confounded with Iceland moss, which is a lichen. See ICELAND MOSS.

Carrara, kär-rä'rä, Italy, a city in the province of Massa-e-Carrara, Tuscany, on the Lavensa, near the Mediterranean, and 60 miles

west-northwest of Florence. An academy of sculpture is established here, and several artists have their residence, attracted by the convenience of obtaining marble almost cost-free. Carrara has some fine churches, an academy of the fine arts, a statue of Garibaldi, and is surrounded by marble hills, which have made it celebrated. Most of the inhabitants are employed in, or in connection with, the quarries. Pop. 42,000. See CARRARA MARBLE.

Carrara (kär-rä'rä) **Marble** (so called from the city of Carrara), the variety of marble generally employed by statuaries. It is a white crystalline limestone, sometimes with black or purplish veins, and occurs in deposits of enormous extent — veritable «marble mountains.» Carrara marble, which was formerly supposed to be a primitive limestone, is now considered an altered sub-carboniferous limestone. The plutonic action to which it has been subjected, has served to obliterate the traces of fossils. The mountains containing the marble are situated a few miles from the sea, and reach the height of over 5,000 feet. Although the quarries have been worked for 2,000 years, having furnished the material for the Pantheon at Rome, the supply is still practically inexhaustible. Those quarries supplying the pure white marble used for statuary are the most valuable. The so-called «Carrara district,» embracing the communes of Carrara, Massa, Pietrasanta, Seravezra, Stazrema, and Arni, is the centre of the marble industry. Carrara and Massa are the two most important, the former having a population in the city itself of 21,000 people, with an additional 21,000 in the mountain villages surrounding it and forming part of the commune. These villages are inhabited almost entirely by the quarrymen and laboring class. The commune of Massa has a population of about 24,000. Broadly speaking, the entire male population of these two communities is actively engaged in some branch of the marble industry. There were in 1901 in the district 611 quarries in active operation, of which 345 are at Carrara, 50 at Massa, and the rest distributed among the places named above. In addition to these, there are perhaps double this number which have been opened and afterward abandoned as being unproductive, or in which, for various reasons, active work has for the time being ceased. Under the sanction of ancient laws, the mountains where the quarries are found are the property and under the direct control of the municipality of the district in which they are located. Applications for leases are made to the syndic of the town, and within a reasonable time, after survey, etc., the concession is granted. The concession is permanent, the only conditions being that the grantee should formally renew it every 30 years, pay the annual rent, and work the property. The rent is merely nominal. Failure to pay it for two successive years or to develop the property in the same length of time renders the concession void. Quarries thus leased may be sold or transferred, or left as an inheritance by the grantee at any time, without formal permission from the grantor. Until 1890 most of the output of the quarries was transported to the local mills, and to the Marina for shipping, by ox-teams. But now the quarry railroad, completed in 1890, greatly facilitates this transportation. From Carrara it makes the difficult ascent of the mountains, through many tunnels and over high viaducts, to a point some 1,500 feet above the sea-level. Tremendous obstacles were overcome in the construction of these 15 miles of railroad, the completion of which cost about $4,000,000. Although largely patronized by the quarry owners, it has not as yet entirely supplanted the former method of hauling by ox-team.

Carraray, Philippines, a small island about 30 miles long and 6 miles wide. It has coal deposits. The population is sparse and wholly uncivilized, subsisting by trade with the neighboring islands of Samar and Luzon.

Carré, Michel, mē-shĕl kä-rā, French dramatist: b. Paris, 1819; d. Argenteuil, near Paris, 27 June 1872. He first published a volume of poems, 'Folles rimes'; then turned to the drama and wrote 'La Jeunesse de Luther' (1843) and 'Scaramouche et Pascariel.' He then worked in collaboration with other authors, especially with Jules Barbier. With him he wrote many dramas, vaudevilles, and opera librettos, several of which met with much success; among his other works are 'Van Dyck a Londres' (with Narrey, 1848); 'Jobin et Nanette' (with Battu, 1849); and 'Le Tourbillon' (with Deslandes, 1866).

Carrel, Nicolas Armand, nĭk-ō-lä är-mäṅ kä-rĕl, French writer and republican leader: b. Rouen, 8 May 1800; d. 24 July 1836. He was educated at the military school of St. Cyr. He entered enthusiastically into several of the secret political societies which were numerous in France after the restoration of the Bourbons. In 1819, when lieutenant of the garrisons of Belfort and Neubreisach, he became implicated in a conspiracy, and though his conduct escaped investigation he was removed with his regiment to Marseilles. He resigned his commission to take an active part in the politics of his time. Finally settled in Paris, he zealously prosecuted his historical and political studies, and became intimate with Thiers, Mignet, and Augustin Thierry, particularly the last. He published a 'History of the Counter Revolution in England,' and in 1830 united with Thiers and Mignet in editing the *National,* which soon rose to be the leading opposition newspaper. After the revolution his colleagues joined the government, and he was left with the chief direction of the paper, which still continued in opposition. In 1832 the *National* became openly republican. Carrel was mortally wounded in a duel with Émile de Girardin. He has been called the Bayard of republican journalism.

Carreño, Teresa, tā-rā'sä kä-rā'ñō, Venezuelan pianist: b. Caracas, 22 Dec. 1853. She was educated by her father and by Julius Hoheni; in 1862 she appeared as a concert player in New York and attracted the interest of Gottschalk, who gave her some instruction especially in regard to playing his own compositions. She has traveled widely in America, and given many concerts; she not only has a high rank as a pianist, but also has won success as a concert singer, and has published a number of musical compositions. Her first husband was Sauret, the violinist, from whom she was divorced; she has also married and divorced Tagliapietra, the singer, and Eugene d'Albert, the pianist.

Carreño de Miranda, Juan, hoo-ān kär-rā'ñō dā mē-rān'dā, Spanish painter: b. Avilés, Asturias, 25 March 1614; d. Madrid, 1685. He was a pupil of Bartolomé Roman and Pedro de Las Cuevas in Madrid, and became court painter. He painted many portraits and excelled in religious subjects. As a colorist the Spaniards rank him with Titian and Vandyke. His principal paintings are a 'Magdalen in the Desert,' at Madrid; a 'Holy Family,' at Toledo; and a 'Baptism of our Saviour,' at Alcala de Henares.

Carrer, Luigi, loo-ē'jē kär'rĕr, Italian poet: b. Venice, 1801; d. 23 Dec. 1850. He was professor of philosophy at Padua, from 1830 to 1833, when he went to Venice, where he conducted a literary journal for nine years, during which time he was also appointed by the municipal council professor in the school of arts and sciences, and director of the museum. Here he published several works, the most popular of which is 'L'Anello di Sette Gemme,' a poetic description of the history and customs of Venice.

Carrera, kär-rā'rā, the name of three brothers distinguished as Chilean revolutionists — José Miguel, Juan José, and Luis. The chief of them, José Miguel, was born at Santiago, 15 Oct. 1785; d. 5 Sept. 1821. They were the sons of a rich landholder in Santiago, Don Ignacio Carrera. One of them served in Europe until 1811, and attained the rank of lieutenant-colonel and commandant of a Spanish regiment of hussars. The three brothers took an active part in the revolution from its commencement, and in November 1811 obtained the effective control of the revolutionary government. José Miguel Carrera was elected first president of Chile. In 1813 he was deposed and succeeded by O'Higgins. The brothers Juan José and Luis, were apprehended in 1817 near Mendoza, on a political charge, and having been first induced to attempt an escape, were brought to trial and executed 18 March 1818. José Miguel raised a body of troops to revenge their death, and a conspiracy was formed in his favor; but it was detected and suppressed, and he himself being defeated and taken prisoner, was executed on the same spot as his brothers.

Carrera, Rafael, Guatemalan revolutionist: b. Guatemala, 1814; d. there, 14 April 1865. He was of mixed Indian and negro blood. In 1837 he placed himself at the head of a band of insurgent mountaineers. Enlisting the sympathies of the Indian population, the rebellion spread. Carrera was in turns courted and caressed by members of the opposite factions which divided the government. In February 1838, he occupied the city of Guatemala with 6,000 Indians, and succeeded in restraining his followers from anticipated pillage and massacre. Having secured his victory, he became dictator in 1840, and from 1844 to 1848 was president of Guatemala; was re-elected in 1852, and made president for life in 1854. He recalled the Jesuits, who in 1767 were banished, and in 1863 he engaged in war with Salvador. After capturing San Salvador, the capital, he deposed President Barrios and appointed Dueñas in his stead.

Carrera, Valentino, văl ĕn tē nō kär-rā'rā, Italian dramatic poet: b. Turin, 19 Dec. 1834. He is one of the most original dramatists of Italy, especially in comedy. Among his many comedies, vaudevilles, etc., the play which won for him a wide reputation was 'La Quaderna di Nanni' (1870), a perfect picture of Florentine life. He has also written some historical sketches and narratives of travel.

Carrere, John Merven, American architect: b. Rio de Janeiro, Brazil, 9 Nov. 1858. He was of American parentage and his education was obtained in Switzerland. He graduated from the École des Beaux Arts, Paris, in 1882, and since 1884 has been a partner in the firm of Carrere & Hastings, New York. The firm designed the Ponce de Leon and Alcazar hotels at Saint Augustine, Florida, and are the architects of the New York Public Library at Bryant Square.

Carrhæ, kär'rē, the name of the site of an ancient city in northwestern Mesopotamia, supposed to have been the biblical Haran.

Carriacou, kär-rē-ą-koo', the largest of the Grenadine islands, in the British West Indies, seven miles long and from two to four broad. It is well cultivated, and produces good crops of cotton. The town and harbor of Hillsborough are on its west side.

Carriage, a general term for vehicles of all sorts, especially wheeled vehicles; in a narrower sense confined to those vehicles that carry persons only, for pleasure or business. The carriage is as old as the wheel. The first man who cut two slices from a tree-trunk and mounted them on an axle was the builder of the first carriage. The early Egyptians and Assyrians knew how to make wheels, as evidenced by carvings on their monuments. Some of these show a wheel made with tire and spokes, a construction indicating considerable mechanical knowledge.

Wheels held in place by wooden pins in the axle, a pole to which the horses were attached, and a rude box open at the rear, constituted the early chariots. These and the primitive carts were always two-wheeled. Four-wheeled carriages came into use with the formation of comparatively smooth roads, being ill adapted to rough and unkept highways. The earliest vehicles were made almost wholly of wood, pinned together, the holes being often burned in, and the parts tied with thongs. The Romans made use of the two-wheeled *carruca* (from which word "carriage" is derived), but although chariots of war and carts for transportation were comparatively common from early times, the carriage proper, for conveying persons, was in very slight use before the 16th century.

As late as 1550 there were only three coaches in all Paris, and the stage coach did not make its appearance in England until 1555. When the coach and covered carriage first came into use they were considered fit only for women and children, men scorning to seek such protection from the weather as is afforded by a covered vehicle. By the opening of the 17th century the coach had become popular, and not only crowned heads, but titled families, commonly employed them, emblazoned with their arms and decorated to the highest degree. Some of the most beautiful and elegant handiwork of that period was expended in the ornamentation of coaches. Elaborate painting, upholstery, and joiner-work combined to pro-

duce the most sumptuous of vehicles. No such extreme effort at display has characterized carriages of later generations.

About 1625 the hackney coach came into existence in London, and the hired cab soon became an established institution. The increase of post-roads and general improvement in highways caused a gradual increase in private carriages and wheeled vehicles of all sorts during the 17th and 18th centuries. The bodies of these early carriages and coaches were suspended by leather straps, and depended on these, in combination with the springiness of the timber employed, to reduce the shocks and jolts to the occupants. That they were jolty enough to afford considerable exercise can be testified to by those who have taken up the modern sport of coaching in imitation of the old-time tally-ho coach. About 1700, steel springs were introduced, but they did not make very rapid headway. The C spring was a radical improvement, but gave way to the elliptic spring, which was invented in 1804 and remains in use to the present day. The rubber-tired wheel was borrowed from the bicycle about 1875, and still further added to the comfort of carriage riders, while the pneumatic tire of more recent date affords the latest refinement of comfort.

The various wheeled vehicles that may be grouped under the name "carriage" embrace a wide nomenclature, the best known being here grouped:

Auto-carriage, an automobile carriage. See AUTOMOBILE.

Barouche, a four-wheeled, falling top carriage, with low body, two inside seats facing, and an outer driver's seat.

Berlin, a four-wheeled covered carriage having a rear seat behind the body.

Britzska, or *Breet,* a four-wheeled Russian carriage with falling top and a rear seat uncovered.

Brougham, a four-wheeled covered carriage with outer driver's seat, and the fore body cut under so as to turn short. The *miniature brougham* seats only two.

Buckboard, a very simple form of carriage, in which a springboard or boards take the place of the springs, the seat being placed in the centre of the springboard.

Buggy, a light carriage with either two or four wheels, and with or without a top.

Cab (short for *cabriolet,* but of more general meaning), a carriage licensed to carry passengers for hire, usually closed, with an outer driver's seat.

Cabriolet, a two-wheeled (later four-wheeled), two-seated, covered carriage with falling top.

Calash, or *Calêche,* a two-wheeled carriage with a falling or folding top, a seat for two passengers, and a narrow seat on the dashboard for the driver; much used in Canada. The top itself is also called a calash.

Car, (1) a railway carriage; (2) a carriage of unusual magnificence, as for use in a procession; (3) a van; (4) one of various special forms of vehicle, as the Irish jaunting-car.

Cariole, a small, light, open carriage, somewhat resembling the calash.

Carryall, a four-wheeled covered carriage, light and commodious, having two or more seats.

Cart, (1) a two-wheeled, light, topless pleasure vehicle; (2) a heavy two-wheeled springless vehicle, with a strong box, for carrying rough material.

Chaise, originally a two-wheeled, one-horse vehicle with a top, the body being hung on straps; later, a light, topless, four-wheeled carriage of varying construction.

Chariot, the early two-wheeled war-carriage; also a light 18th-century coach, with one inner seat and a driver's seat.

Coach, a four-wheeled covered carriage of large size, having two or more inner seats and one or more outside — a tally-ho; also, a two-seated four-wheeled cab, or large hack.

Coupé, a four-wheeled carriage, low-bodied, with an outer driver's seat.

Curricle, a simple form of two-wheeled two-horse carriage.

Dog-cart, a light pleasure cart with back-to-back seats, the rear seat covering a box to carry a dog or dogs.

Drag, a form of coach or tally-ho, sometimes uncovered.

Drosky, a long-bodied, four-wheeled Russian carriage. In its primitive form the body is a plank on which the passengers ride astride; also, in some European cities, a public hack.

Fiacre, the French name for a public cab.

Gig, a very light, small-bodied, two-wheeled, one-horse vehicle, with seat for one.

Hack, a hackney coach; loosely, any cab.

Hackney Coach, a four-wheeled coach kept for hire.

Hanson, or *Hansom Cab,* a two-wheeled, low-bodied, one-horse, covered carriage, having a single seat, closed in with front doors, and seat for the driver behind.

Jaunting-Car, a light two-wheeled, sometimes four-wheeled, vehicle having a perch in front for the driver, and longitudinal seats extended over the wheels, and a well between them for baggage.

Landau, a coach-like vehicle having a top, the forward part of which is removable and the rear part folding.

Landaulet, a one-seated landau.

Omnibus, a four-wheeled covered carriage with long body, seats running longitudinally, a rear door with steps; often with seats on the roof.

Phaeton, a light pleasure carriage of varying construction, usually low-bodied.

Rockaway, a four-wheeled pleasure carriage with two seats and permanent top.

Sociable, a four-wheeled topless pleasure carriage, with facing seats.

Stage, a four-wheeled carriage of large size, with several seats inside and on top, for long journeys; called also stage coach; loosely, an omnibus.

Sulky, a two-wheeled carriage, of skeleton construction, with a seat for one directly on the shafts.

Surrey, a light four-wheeled box carriage with two seats, and often side-bars.

Tally-ho, a four-in-hand coach.

T Cart, a pleasure cart having a T-shaped body.

Trap, a pleasure carriage; a term used very loosely.

Van, a very large covered wagon for conveying bulky articles, as furniture.

Victoria, a four-wheeled carriage with falling top, a seat in the body for two, and an elevated driver's seat cut under.

Wagon, a heavy four-wheeled vehicle, usually with rectangular box, for carrying goods, sometimes with removable seats, and often with removable top.

Wagonette, a light wagon for pleasure riding, with longitudinal seats facing each other, and entered by steps and a door in the rear.

To these might be added many more compound names, as top-buggy, box-buggy, post-chaise, etc. It is difficult sometimes to draw the line of distinction absolutely between many of the forms of carriages here named. Even the very common names of "coach" and "cab" overlap in use, that which one would call a cab in one part of the country being known as a coach in some other section.

The important parts common to the typical form of carriage are as follows: Body, seat, top, hood, dashboard, apron, step, springs, running-gear, perch, forward gear, clip, fifth-wheel, tongue, shafts, swingletree, doubletree, axle, wheel, hub, spoke, felloe, tire. The body of a carriage is commonly made of selected hard wood, ash, oak, hickory, etc., being preferred. It is put together with iron braces, screws, mortises, and tenons, and glue. The top, if permanent, is supported on selected wood uprights, or, if falling, is framed of iron or steel rods that fold up and open into a braced position. Leather, canvas, and leatherette are used as coverings. The gear, axles, shafts, poles, etc., are commonly of wood, selected with special reference to straight grain and consequent strength. The parts are largely reinforced with metal at all points where special strength or resistance to friction is essential. The tendency is to increase the use of metal to replace wood, and many carriages are made with steel axles and side-bars.

The fifth-wheel is the circular device in which the forward axle turns, and is made of iron or steel. The axles have metal boxes, which in the old style are lubricated with axle-grease, but in many modern vehicles roller-bearings are being substituted, that run with very little or no lubrication. The regulation wooden carriage-wheel has spokes let into the hub and felloes, the whole being held together by the pressure of an iron tire. Instead of making a wheel in the form of a flat disk, the practice is to make it dishing; that is, with the spokes inclining slightly away from the body of the carriage. The reason for this is that a vehicle wheel that is one of a pair receives the most strain when the vehicle is on an incline tipped to one side. In this position of severest strain the spokes of the wheel on the lower side nearest the ground, bear the weight, and when dished are inclined to the best position to receive the load.

This dishing of the wheel produces a necessity for placing the axle box slightly out of alignment. A dished wheel running on a straight axle tends to bear against the end nut, and work off the axle. By drawing the axle skein slightly inward at the forward side this tendency is overcome, and the wheel runs true. The wire wheel, or bicycle wheel, as it is commonly called, is made on a different principle, and dishing of the spokes and drawing of the axle are unnecessary. In these wheels the hub may be regarded as suspended from the tire, and the wire spokes are so spread that they receive the strains due to an inclined roadway to as good advantage as would the spokes of a dished wooden wheel.

Previous to 1850 most carriages were built by wheelwrights, assisted by blacksmiths, and the wheelwright's shop was to be found beside the blacksmith's shop in nearly every village. The development of carriage manufactories has changed all this, and the occupation of the country wheelwright is almost gone, a few remaining who do simply a general repairing business. The carriage factories buy their lumber and hardware and supplies in large quantities, and use up the raw material in a more economical manner than could the wheelwright. But their greatest advantage is the use of special machinery. In tirework alone there are four special machines employed, the tire-bender, tire-setter, tire-upsetter, and tire-shrinker. Special lathes have been designed for turning out spokes, axles, hubs, etc., and there are hub-borers and templates, and all the conveniences equivalent to those used in the construction of general machinery. Amesbury, Mass., is a centre of carriage manufacture, but there are factories scattered through various parts of the United States.

The term "railway carriage" was commonly employed in the early days of railroads, and is still in use in Great Britain, where "coach" is, however, the technical word, but in the United States it has given way almost wholly to the shorter and more distinguishing "car" (q.v.).

The most recent development in carriages is the auto-carriage, or automobile (q.v.).

For further information as to carriages and carriage-building, see Richardson, 'Practical Carriage Building' and 'The Blacksmith and Wheelwright.'

Carriages of Machines.— The term "carriage" is also applied to any traveling or moving part of a machine that serves to carry or transport something, usually back and forth. In this sense carriage is to be distinguished from "conveyor," which is applied to more or less similar devices for transporting something that is picked up at one point and dropped or discarded at another. Examples of machine-carriages are the lathe-carriage, being that part of the lathe that travels back and forth, carrying the cutting tool; the carriage of a planer or shaper, performing a similar office; and the typewriter carriage, being the moving part that supports the sheet of paper and the platen.

C. H. COCHRANE.

Carriage and Wagon Industry. From the earliest times of which there has been any historical record, mankind has utilized wheels as a means of transportation. On the great sculptured stones now in the British Museum, taken from the ruined city of Nimrod near Nineveh, can be seen, besides the innumerable war chariots, carts drawn by oxen, and carts drawn by men. The writer made a drawing of one of the latter kind, which shows very good construction. The wheels have six spokes and are well proportioned; probably they were about 42 inches high. The body is framed up with posts and a top rail, and the spaces are filled with handsome wickerwork. There is an arched guard over the wheel to protect the latter from contact with the overhanging load.

The cart is loaded with logs of wood. On another slab is shown the king's chariot, with an elegant canopy over the royal head. This chariot carries, besides the king, the charioteer and an arms-bearer. In biblical history the chariot is very frequently referred to, those of the great army of Pharoah being engulfed in the Red Sea. It is worth noting that the word "carriage" was at one time used in the sense of goods or baggage, and we find in the New Testament, "After those days we took up our carriages and went up to Jerusalem." The Greeks and Romans were, of course, familiar with the horse-drawn vehicle, and in the story of the Trojan war we find Achilles dragging the body of Hector, lashed to his chariot, around the walls of Troy. Carriages without wheels were used as late as the 17th century, when they were known as litters, having shafts behind and before, which were supported upon the backs of the horses. The litter was but a form of the sedan chair, itself a species of carriage. If we look for a carriage with wheels but without horses, we find it in the jinrikisha of Japan, a unique vehicle drawn by manpower. The ancient chariot, with all its splendor of decoration, was but a two-wheeled cart without springs, and this, the starting-point in the evolution of the carriage, we find among many barbaric peoples, the wheels being formed of solid wood rendered circular when nature formed the trees from which they were made. Even the triumphal and funeral cars of early history were but springless carts; and ages of progress lie between a gorgeous chariot of the Cæsars and a modern buggy. Queen Elizabeth's wonderful state coach, with its highly ornamented and canopied body, was without springs. It was a sort of triumphal car for state parades. Her usual mode of locomotion was by water or on horseback.

The various forms which the modern carriage has assumed appear to be almost limitless. The old-time stage-coach has developed into the fashionable drag or tally-ho; the post-chaise and the curricle are no more; but there are still left to us innumerable forms of vehicles, of which the American buggy is perhaps the most useful and represents the highest development of the carriage-builder's art. Many of the forms came to us from England, notably the brougham, named for Lord Brougham. The landau takes its title from the town of the same name in Germany, where it was first made. A few specimens of the Irish jaunting-car have found their way to America, where they serve to remind us of the active nation with which they are popular. The hack as a name is solely American, but is of course a lineal descendant of the English hackney coach. See CARRIAGE.

Carriage-building, as an art, began to be developed in all parts of Europe about the middle of the 17th century. Steady but slow progress was made in all the great cities, and some almost elegant forms are shown in the old prints, profusely decorated. The running parts, however, were very imperfect. The first relief from the jolting of the dead-axle carriage was accomplished by suspending the body of the carriages on long leather thoroughbraces stretched from upright iron jacks which stood up from each end of the running part. The next improvement was made by transforming these stiff iron jacks into spring jacks, and by making them of steel plates. Finally, in the early part of our own century, the spring jack was given a bold, sweeping curve, and the beautiful C spring evolved. The Collinge axle, now in common use all over the world, was perfected almost 100 years ago, and the elliptic spring, the best of all springs, was invented at about the same time. It was early in the 18th century that the post-chaise came into use for journeying, and the hackney coach and hackney cab came to take the place of the sedan chair in the great cities. This created quite a war in London between the watermen and the chairmen on the one side, and the coaches on the other.

In very old times the post-chaise had a small body hung very high on its leather straps; the wheels were very high and far apart, and the postilions rode the "near" horses. In later times this uncouth post-chaise developed into the elegant chariot, perhaps the most perfectly formed carriage ever built. This carriage, with its gorgeously draped coachman's seat, as well as the full coach similarly mounted, is now seen only at royal receptions and other state occasions in the capitals of monarchical countries. As with other inventions, the evolution of the carriage has taken place by fits and starts, the greatest progress having been made during the present century, and the field in which that progress occurred having been the United States of America.

The volume of business done by American carriage manufacturers in 1795 was exceedingly small. Technical knowledge was not wanting, however, for there were many shops which had been established in colonial days, where fine carriages were occasionally built, and many imported French and English vehicles repaired. But business languished for lack of customers. Before the War of the Revolution the rich shipping merchants of Salem, Boston, Newport, New York, Philadelphia, Baltimore, and Charleston lived in good style, as was common in those monarchical times, and imported in their own ships coaches, chariots, and phaetons, from England and France. Repair shops sprang up in all the large towns and cities, and skilled workmen came from England, Ireland, and Scotland, finding ready employment on their arrival.

A curious bit of history, clearly showing the use of carriages in New York city in 1770, came to the writer's knowledge some years ago from the late George W. W. Houghton, who embodied the facts in a lecture delivered before the New York Historical Society. The old record, which he somewhere discovered, gives a list of 59 owners of carriages; and the vehicles mentioned were 26 coaches, 33 chariots or post-chaises, and 26 phaetons — in all, there were 85 vehicles. The names of the owners were Cadwallader Colden, Daniel Horsmanden, John Watts, Oliver De Lancey, Joseph Reade, Charles W. Apthorp, Colonel Roger Morris, Henry Cruger, John Cruger, James De Lancey, the widow of Governor James De Lancey, the widow of William Walton, the widow of Judge John Chambers, the widow of James McEvers, the widow Lawrence, Mrs. Waddell, Andrew Elliott, William Bayard, Nicholas Bayard, Philip Livingston, John Livingston, Robert G. Livingston, Walter Rutherford, Gerardus Beekman, Colonel Beekman, Nathaniel Marston, John

Marston, Rev. Dr. Ogilvie of Trinity Church, Anthony Rutgers, Jacob Le Roy, David Johnson, William Axtell, Miss Lodge, Leonard Lispenard, Samuel Verplanck, Lawrence Kortright, David Clarkson, John Van Cortlandt, Robert Murray, James Jauncey, Dr. William Brownjohn, Dr. Jonathan Mallet, Thomas Tiebout, Jacob Walton, John Watkins, Nicholas Gouverneur, John Aspinwall, Hugh Wallace, Isaac Low, A. Van Cortlandt, Gerardus Duyckinck, Gen. Gage, John Read, Archibald Kennedy, Thomas Sowers, Captain John Montressor, John Leake, Abraham Montier, and Ralph Izard. Many of these names are familiar to the New Yorker of to-day, the prestige of the old families having kept pace with the march of events.

It will be observed that there were but three styles of carriages known among the old aristocracy, and they were all for town use. No similar records are to be found in other cities, but there are many ancient relics of grand chariots now to be found in Boston and vicinity, still preserved in the stables of the old families as curiosities.

The effects of the struggle for independence, and the hard times which followed, so impoverished the people that there was but little use for carriages of luxury in the early days of the present century. The tendency of all classes was essentially democratic, and rigid economy was esteemed a great virtue. This state of things was not favorable for the makers of fine carriages; but, fortunately for them, all well-to-do people required something to ride in, and that took the form of the two-wheeled chaise, immortalized by Dr. Holmes. These were in great demand as the country grew prosperous, and were built in large numbers in Boston, Salem, Worcester, Pittsfield, West Amesbury, Mass., New London and New Haven, Conn., as well as in Wilmington, Del., and Philadelphia. They had enormously high wheels, and the tops were stationary, being supported on iron posts. Curtains of painted canvas or leather covered the sides and back. These chaises were often built without dashers or aprons in the earlier times, but in later years they had falling tops and were gay with silver plate. So universally was this style of carriage in use that most carriage-makers were known as "chaise-makers," as the old signboards of 50 years ago plainly indicated. Chaise-making throve mightily, and up to about 1840 it seemed that nothing could ever fully supplant the favorite old two-wheeler. But the buggy, which had been struggling for existence for several years, began to come to the front.

The chaise had been for generations of nearly the same form, no radical changes having been tolerated; but the buggy came in a multitude of forms, as it was new and without any recognized standard of shape to hamper the fancy of the builder. At last the door was open for novelties, and has since been still wider open, with no signs of being closed again.

The buggy is purely American in its origin, and is without doubt the greatest achievement of American carriage-makers. The body may be of any form, but the running part is always of the same, or nearly the same, type. Its common-sense construction is wholly unlike the work of any other country. It is simpler, lighter, stronger, and cheaper than any other style of vehicle, and is so admirable in all respects that it is not likely to go out of use for at least another century.

In the early days of this century of progress a great stimulus was given to the carriage and wagon trade by the advent of the grand old stage-coach. It was elegant in form, gay with paint and gilded scrollwork, and when starting out on its journey, rocking on its tough thoroughbraces under its load of passengers and baggage, with its team of four or six Morgan horses, it was an inspiriting sight. It has been said that the stage-coach was unknown in America prior to 1810, but this is a mistake. In 1776 John Hancock stole away from his duties in the Continental Congress to Tamfield, Conn., where he married the beautiful Dorothy Quincy, and took her on a wedding journey to Philadelphia by stage-coach. The incidents of the journey, including the upsetting of the coach, are duly set forth in the record of William Bant, attorney to Gov. Hancock. It is also related that Mrs. Hancock took a similar journey with her son, who was but two weeks old, to join her husband in Philadelphia. This was in 1778. The roads, however, at this early date, were little better than bridle-paths, and the chief resource for journeying was the saddle. In 1791 there were but 1,905 miles of post-roads in the States, and in these roads were many bottomless sloughs, and corduroy bridges consisting of round logs laid crosswise over swamps, sometimes for long distances. As the government and local authorities improved and extended the roads, some sort of public conveyance followed.

In New York, New Jersey, and Pennsylvania the great Conestoga wagon, broad-wheeled, and with huge canvas-covered body, was drawn over the rough roads by six or eight horses or oxen for the transportation of freight and passengers. This wagon was the prototype of the famous "prairie schooner," or emigrant wagon, of later times.

Government roads, called military roads, were built across the mountains of Virginia, connecting the East with the valley of the Ohio; also through the great forests of Maine to the town of Houlton on the New Brunswick frontier, and in many other parts of the country. They were for postal and military purposes. On all these were quickly established thriving stage lines, and the business grew very rapidly. Capital was freely invested in the varied interests directly and remotely connected with the innumerable lines which radiated from all the chief towns and cities in the country; and the investments paid good dividends.

The carriage-maker, the harness-maker, the horse-breeder, and the jolly old country tavern-keeper, with his good dinners, his well-stocked and well-patronized bar, all seem to have been prosperous and happy in the good old slow-going time.

Stage-coaches and wagons were built in many places at the time I write of. Salem, Mass., was early in the field. Osgood Bradley, of Worcester, was a large builder; the Troy coach, of Troy, N. Y., was very famous in its day; but a little later, and still more famous came the Concord coach, of Concord, N. H. The founder of the house of Abbot, Downing

& Company, now the largest wagon-builders in New England, whose work is known throughout America as well as in South Africa and Australia, was Louis Downing, who moved to Concord from Salem, Mass., in 1815. There he began the manufacture of coaches and wagons; and after 80 years, this old house is still in the full tide of active business.

So great was the coaching business from 1810 to about 1845, that in addition to the builders hundreds of smaller shops derived their chief income from repairing and painting these fine old road coaches. See COACH.

After the War of 1812, trade and commerce entered upon a new career of prosperity. The shipping merchants were piling up wealth; manufacturing, which had grown strong by the fact that the war had thrown us wholly on our own resources, was opening up new sources of wealth, and again stylish carriages for city use were in demand. Fine coaches and chariots, hung on C springs, and made grand with the hammer-cloth coachman's seat, were built in all the large cities. Boston had two well-equipped shops for this kind of work; New Haven and Bridgeport were active and growing; Newark, N. J., became celebrated for its fine productions; and New York, Philadelphia, Baltimore, and Wilmington, Del., were supplying their own wants and sowing the seeds of greater development in later times.

About this time a considerable export trade grew up with the West Indies. The carriages shipped there were known as volantes, and were large two-wheeled vehicles with immensely long shafts. The wheels were placed so far in the rear of the vehicle, in order to give greater freedom of access, that the shaft horse had a very large share of the weight upon his back. In addition to this, the overloaded beast carried the postilion, while the leader did most of the hauling. These carriages were shipped by the sugar and molasses merchants of the northern cities to the planters of the West Indies in commercial exchange for their product, which was speedily converted into rum, then in great demand at home and abroad. Thus the carriage-maker played his part in the interchange of commodities, and trade flourished.

Farmers' wagons and carts had been made in every village in the country since the earliest time, but wagon-making as a great business began with the development of the Western States. First came the large emigrant wagon, and after that the lighter farm wagon, and, later still, wagons for the great overland current emigration, which flowed like a mighty river from the East to the gold-fields of California. Happily for the emigrants, the wagon-makers of the West were equal to the occasion. Great factories quickly grew up, stimulated by this additional demand, and among the rest the great house of Studebaker Brothers, which had its origin as far back as 1813, now came to the front, reorganized and ready for business. This firm, now the largest wagon and carriage manufacturers in the world, was just in time to take a leading part in supplying the government with army wagons for the western regiments in the Civil War. It was due to the thorough equipment of the wagon-makers of the country that the armies of the North were better and more properly supplied with the means of transportation than any army in military history. Wagon-building is so vast in its proportions that when one visits such an establishment as that at South Bend, Indiana, he wonders where purchasers can be found for so many vehicles, a wagon being produced every 10 minutes in this one factory.

The older men of the present generation of carriage-makers have witnessed a great change in the extent as well as in the method of manufacturing. In the early years of the century, business in the old carriage towns was done on what is called the "dicker" system. Woodworkers, blacksmiths, trimmers, and painters, each did business on his own account, and swapped parts, as they termed it, the final settlements being made in finished carriages. The dealer in materials also took carriages in payment. The workmen were paid with orders for goods, and money was almost unknown in all the various transactions. The old operators, who did business in this way, used to say that the plan was much safer than the cash system, there being fewer failures and less danger of getting involved in debt.

By and by the small operators with their little shops went the way of all old-time things, and well-organized factories succeeded them. Then a multitude of inventions in machinery were eagerly taken up and utilized. Larger and larger grew the factories, more and more perfect the machinery, until the present time, when the limit of quick methods and cheap production seems to be well-nigh reached. But the end is not yet.

Much the larger number of carriages built in the great factories where machinery is employed are built in duplicate by the million, and are sold to the million at exceedingly low prices. Of course, there are many qualities among the vast variety of vehicles built by the new processes, and many grades of stock enter into their composition. As in all other manufactures, the price is a very fair indication of quality. One might think that in the rush for low prices of both builders and buyers all really good work would be superseded by low grades, and that the tendency would be steadily downward in quality; but such is not the fact. Fine work — I may say superb work, that which taxes the highest skill and care of the best designers and mechanics — is still in great demand, and will probably continue to be for all time.

There are many builders of high-grade work widely known by the public, of whom I should be glad to speak, and who are distinguished for their excellent productions; but I will name only one, easily the first in this or any other country — Brewster & Company, of New York. A visit to this great establishment — of which all American carriage-builders are justly proud — will show the appreciative observer to how high a degree of perfection, beauty, and completeness modern carriage-building has attained.

In 1872 the leading carriage-makers of the country formed an association called the "Carriage Builders' National Association." The

good that this organization has accomplished by means of its annual conventions can scarcely be estimated. All trades which have similar associations know the value of good fellowship and good feeling among competitors instead of the old-time jealous antagonism. Very early in the history of the association the decay of the useful old apprenticeship system was recognized; and as a substitute for this past method of training workmen a fund was raised by subscription for a technical school, to be established in New York city, to teach the science of carriage drafting and construction. This school has been a great success. Under able teachers a large number of talented young men have graduated, well equipped to take charge of the constructive departments in our factories. Thus scientifically trained foremen and whirling machinery now very largely take the place of the skilled workmen who formerly occupied our benches, each working by his own methods, carefully guarded, in which there was more of the rule of thumb than of science.

It is fortunate for the graduate of the technical school when, in addition to the knowledge gained in the course of his studies, he has the inborn faculty of producing new and beautiful forms; that keen sense of fair proportions and graceful lines which is the necessary qualification of a designer. Few things fashioned by human skill are more beautiful than a fine carriage; none but a true artist in his line is fit to determine its form, and none but an expert mechanic, painstaking and honest, is fit to supervise its construction. The light-weight carriages now required, the tremendous strain and rough usage which they must undergo without a sign of weakness, require the most carefully selected stock and the most watchful care in all the details of mechanical arrangement.

The volume of business done by all the carriage-makers in the country is clearly shown by the last census report, from which the following figures are taken:

AMERICAN CARRIAGE AND WAGON TRADE.

Number of establishments	7,632
Total number employed	66,842
Number of wage earners employed	62,540
Officers, clerks, etc	4,302
Capital employed	$118,187,838
Miscellaneous expenses	6,261,469
Wages of workmen	29,814,911
Salaries of officers, etc	4,073,932
Value of all products	121,537,276
Cost of materials	56,676,073
Value of family and pleasure carriages	51,504,176
Value of business, farm, municipal, etc., wagons	31,480,157
Value of automobiles, etc	4,680,276
Repair work	25,192,057

That the volume of business done in the carriage trade at the present time is fully equal to the wants of the community is evident from the exceedingly sharp competition among builders and dealers. The business, however, will certainly continue to grow as fast as the increased capacity of the purchasing class can be made to absorb the increased product.

Given that prosperity which our country and her beneficent institutions insure us, if wisdom rules, a continued advance will be made, a wider and wider market will be open to us, greater novelties will be forthcoming to tempt the lovers of new things, greater perfection will be attained, and a greater number of our hard-working fraternity will find good employment with satisfactory returns.

CHAUNCEY THOMAS,
Chauncey Thomas & Co., Boston.

Car'rick, Scotland, the southern district of Ayrshire. The surface is mountainous, but in the valleys and along the shores of the Atlantic the ground is level, with a fine clay or loamy soil. It became the property of Robert Bruce, father of the Scottish king of that name, by his marriage with the heiress of the Earls of Carrick; and this title is still royal, being assigned to the eldest sons of the kings of Great Britain.

Carrickfergus, kăr-rĭk-fĕr'gŭs, Ireland, a seaport town in the county of Antrim, 10 miles by rail northeast of Belfast. It is a municipal borough, and also a county of itself, called the county of the town of Carrickfergus. It comprises an area of about 25 square miles, of which only 129 acres is embraced in the town proper, the remainder belonging to the territory of the county. The Bay of Carrickfergus is a small indentation on the north side of Belfast Lough. It is memorable in history as the landing-place of King William III., who disembarked on its shore at the quay of the town of Carrickfergus, on 14 June 1690. The castle stands upon a rock projecting into the bay, and is still maintained as a fortress, having a number of guns on the walls and a small garrison. The public buildings besides the Episcopal, Roman Catholic, and other churches, are a town hall, court-house, market-house, etc. Pop. (1891) 8,923.

Carrier, Common. See COMMON CARRIER.

Carrier, Jean Baptiste, zhŏñ bāp-tēst kăr-rē-ā, French Jacobin: b. Yolet, near Aurillac, 1756; d. Paris, 16 Dec. 1794. At the beginning of the Revolution he was an obscure attorney, but in 1792 was chosen a member of the convention. He aided in the establishment of the revolutionary tribunal, 10 March 1793, and exhibited the wildest rage for persecution. He voted for the death of Louis XVI., demanded the arrest of the Duke of Orleans, 6 April 1793, and contributed greatly to the outbreak of 31 May. On 8 Oct. 1793, he was sent to Nantes with a commission to suppress the civil war and finally put down the Vendeans. Multitudes, informally and precipitately condemned, were executed daily; but Carrier resolved to destroy the prisoners by numbers at a time and without a trial. He first caused 94 priests to be conveyed to a boat with a perforated bottom, under pretence of transporting them, but in reality with a view of having them drowned by night. This artifice was repeated a number of times, and the victims were of every age and of both sexes. These wholesale murders by drowning were called noyades. The executioners are also said to have sometimes amused themselves by tying together a young man and woman, who were then forced into the water; and they called the murders carried out in this way «republican marriages.» It has been estimated that 15,000 individuals perished in this manner. The banks of the Loire were strewed with the dead, and the water was so polluted that drinking it was prohibited. Out of terror people refrained for a time from drawing public attention to these

atrocities, but at last the truth began to become known, and Carrier was recalled. Shortly after the fall of Robespierre he was arrested and brought before the revolutionary tribunal, which condemned him to death, and he was guillotined accordingly.

Carriera, Rosalba, Italian painter: b. Venice 1675; d. 1757. She is chiefly known by her portraits in crayon. In 1705 she became a member of the Academy of St. Luke in Rome, and in 1720 of the Academy of Bologna. She visited Paris in 1720 and painted portraits of King Louis XV. and members of the court. She was elected a member of the French Academy and in 1721 returned to Venice. She was a great worker and toward the end of her life became blind from overwork.

Carrière, Moritz, German author: b. Griedel, Hesse, 5 March 1817; d. Munich 19 Jan. 1895. He studied philosophy at Giessen, Göttingen, Berlin, and in Italy. In 1849 he became professor of philosophy at Giessen and after 1853 held that position at Munich. He was a defender of Christianity, opposed Ultramontanism, and was of the liberal school. He also took high rank as an art critic. Among his published works are: 'Der Kölner Dom als freie deutsche Kirche' (1843); 'Abälard und Heloise' (1844); 'Die Religion in ihrem Begriff' (1841); 'Die philosophische Weltanschauung der Reformationszeit' (1847); 'Das Charakterbild Cromwells' (1851); 'Die Kunst im Zusammenhang der Kulturentwickelung und die Ideale der Menschheit' (1863–71); 'Geschmack und Gewissen' (1882).

Carrier-Belleuse, Albert Ernest, äl-băr ĕr-nā kā-rĕ-ā-bĕl-lĕrz, French sculptor: b. Anizy-le-Château 12 June 1824; d. Paris 3 June 1887. He was a pupil of David d'Angers, and while studying was compelled to earn his living by making models for the manufacturers of bronzes. Toward the close of his life he was director of the porcelain works at Sèvres. His works include marble sculptures and terra-cotta busts; among them are 'Angelica'; 'Madonna and Child' (in the Church of St. Vincent de Paul in Paris); 'Sleeping Hebe'; 'Forsaken Psyche'; and a number of busts of remarkable truthfulness to life.

Carrier-pigeon. See HOMING PIGEON.

Carrier Shell, or **Mason Shell,** a gastropod mollusk of the genus *Phorus,* which covers its shell with grains of sand, shell, coral, etc. These bits are fastened by an exudation from the mantle, and are apparently protective in their purpose.

Carrières, Louis de, French theologian of the Roman Catholic Church: b. Cluvilé 1662; d. Paris 11 June 1717. In 1689 joined the Congregation of the Oratory and became well known as a theologian. At the request of Bousset he published a 'Commentaire Littéral' (24 vols. 1701–16), reprinted Paris 1872.

Car'rington, Edward, American soldier: b. Charlotte County, Va., 11 Feb. 1749; d. 28 Oct. 1810. He was lieutenant-colonel of Gen. Harrison's artillery regiment, quartermaster-general under Gen. Greene, a delegate to the Continental Congress, and foreman of the jury in Aaron Burr's trial for treason.

Carrington, Henry Beebee, American lawyer, soldier and historian: b. Wallingford, Conn., 2 March 1824. He graduated at Yale in 1845; taught at Tarrytown, N. Y., 1846 and at Yale Law School 1847; began the practice of law in Columbus, Ohio, in 1848, and took an active part in the anti-slavery movement. In the convention which met in 1854 to organize the Republican party, Carrington was a member of the committee appointed to correspond with persons in the different States with a view of making the movement national. In 1857 he was Adjutant-General on the staff of Gov. Chase and organized the State militia in preparation for war. In 1861 he was appointed colonel of the 18th United States infantry, served through the Civil War, and afterward was in service on the plains; was wounded in war with Sioux Indians and retired in 1870; he became professor of military science and tactics in Wabash College, Ind., a position which he held till 1873. He has written: 'Russia as a Nation'; 'American Classics'; 'Ad-sa-ra-ka, Land of Massacre'; 'Battles of the American Revolution'; 'Washington the Soldier,' and other works.

Carrington, Paul, American statesman: b. Charlotte County, Va., 24 Feb. 1733; d. 22 June 1818. He was graduated at the College of William and Mary. During the Revolution he was a member of various conventions and of the Committee of Safety; opposed the Stamp-Act resolutions of Patrick Henry; became a member of the court of appeals, and in the Virginia convention voted for the adoption of the Federal Constitution.

Carrington, Richard, English astronomer: b. Chelsea, 26 May 1826; d. November 1875. Carrington entered Trinity College, Cambridge, in 1844, to prepare for the Church, but his scientific tendencies being awakened by the lectures of Prof. Challis he turned his attention to astronomy. He held the post of observer at the University of Durham from 1849 to 1852. He was elected a Fellow of the Royal Society (7 June 1860). His work 'Observations on the Spots on the Sun' (1863) furnished data that materially affected the study of solar physics.

Carrion-crow, any of several large carrion-eating birds. The only true carrion-crow (*Corvus corone*) is found in England. It is larger than a crow, of black plumage, and with feathered neck. It is seldom seen in flocks, and lives upon carrion, small mammals, eggs, and birds. In the southern United States the name is locally given to the black vulture (*Catharista atrata*), a bird closely related to the turkey-buzzard (q.v.), but smaller, and resembling it in habits and public service as a scavenger. Its bluish and spotted eggs number from one to three and are placed in a nest built under logs and bushes.

Carrion-flowers, certain species of the genus *Stapelia* (natural order *Asclepiadaceæ*), so called because of their putrid odor. In the United States the name is also given to the *Smilax herbacea,* a liliaceous plant.

Carroll, Charles, "of Carrollton," American patriot: b. Annapolis, Md., 20 Sept. 1737; d. Baltimore, 14 Nov. 1832. He attended several schools abroad; studied law in Paris and London, where he became a member of the Inner Temple; returned to his native country in 1764; was elected to the Continental Congress in 1775, and with the other members

signed the Declaration of Independence, on 2 August of the following year. To make certain his identity, he added "of Carrollton" to his signature, thus distinguishing himself from another by using the name of his family mansion. After many more years of important public service to the State of Maryland and to the new republic, in 1804 he withdrew to private life at Carrollton, which was his patrimonial estate, and where as his life advanced he became an object of universal veneration. He survived by six years all the other signers of the Declaration.

Carroll, Henry King, American clergyman and editor: b. Dennisville, N. J., 15 Nov. 1848. He was on the staff of 'Hearth and Home' (Methodist), and from 1876 to 1898 was religious and political editor of the *Independent.* He has written 'The Religious Forces of the United States'; and many reviews, reports, and miscellaneous papers. He supervised the compilation of religious statistics for the 11th census, and in 1898 was appointed to prepare a report on the internal conditions of Porto Rico. In 1900 he became a secretary of the Methodist Episcopal Church Missionary Society.

Car'roll, Howard, American journalist: b. Albany, N. Y., 1854. He began newspaper work in New York as reporter for the *Times,* of which he subsequently became special Washington correspondent. He has since held several responsible business positions and is the author of 'A Mississippi Incident'; 'Twelve Americans: Their Lives and Times.'

Car'roll, John, American prelate: b. Upper Marlborough, Md., 8 Jan. 1735; d. Georgetown, D. C., 3 Dec. 1815. He was a cousin of Charles Carroll of Carrollton, and first Roman Catholic bishop in the United States. At the age of 13 he was sent to Belgium to be educated. He was professor (1759–71) at St. Omer's and Liège, then, becoming a Jesuit, he was made prefect of the Jesuit College at Bruges. On the suppression of the Jesuits in 1774, he returned to the United States. In 1784, at the suggestion of Franklin, he was appointed superior of the Roman Catholic clergy in the United States; was made bishop in 1789; and in 1808 was created archbishop of the archdiocese of Baltimore. Georgetown College was founded by Bishop Carroll in 1791.

Carroll, John Joseph, American Roman Catholic clergyman: b. Enniscrone County, Sligo, Ireland, 24 June 1856. He came to the United States in infancy, was educated in St. Michael's College, Toronto, Ontario, and at St. Joseph's Theological Seminary in Troy, N. Y. He became assistant priest in the Cathedral of the Holy Name, Chicago, in 1880, and subsequently rector of St. Thomas' Church there. He is a Gælic scholar of prominence and has written 'Notes and Observations on the Aryan Race and Tongue' (1894); 'Prehistoric Occupation of Ireland by the Gælic Aryans.'

Carroll, Lewis. See DODGSON, CHARLES LUTWIDGE.

Carron Oil, a mixture of equal parts of linseed oil and lime water, much used as a dressing for burns. It has no particular advantages over other simpler and neater dressings, notably vaseline, or oxide of zinc ointment. Its name is derived from its use in the Carron Foundry, Scotland.

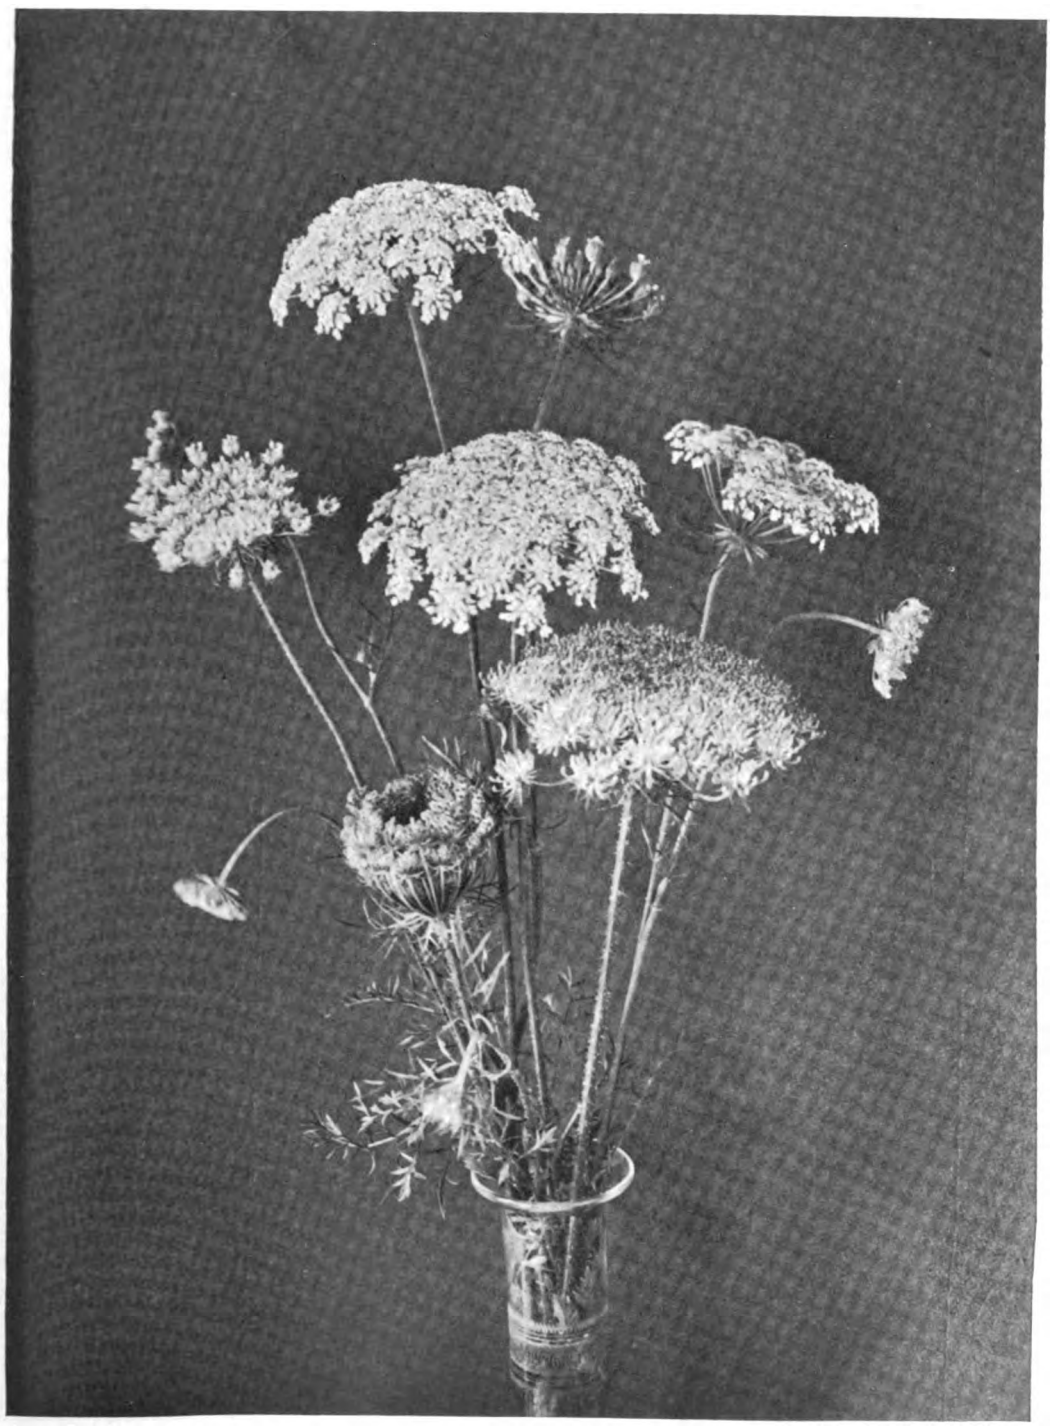
Carronade', an iron gun introduced in 1779 by the director of the Carron Foundry, in Scotland, from which it took its name, said to have been invented in 1752 by Gen. Melville, and first used in the American Revolutionary War. They were of large calibre, and lighter than common cannon; but they admitted of only a small charge of powder and had a very confined range. See ORDNANCE.

Carrot, a biennial plant (*Daucus carota*) of the natural order *Umbelliferæ.* It is a native of Europe, introduced into America, and is known as a troublesome weed upon poor land especially in the eastern United States. It is more favorably known by its cultivated varieties which are said to have been derived originally from Holland prior to the 16th century, since when it has become deservedly popular in all temperate climates. Certain large-rooted varieties are raised for stock feeding. The most popular culinary varieties are small, rapidly growing plants of diversely formed roots. Since they are most used as a flavoring in soups, stews, and other dishes which have not become specially popular in America, they are less cultivated here than in Europe, where these dishes are commonly made. The plants succeed best in a warm, friable, rich soil, well supplied with moisture, free from stones, weeds, etc., and in the best physical condition. The seed may be sown in drills one half foot apart as soon as the ground has become warm, since they are slow to germinate and since the seedlings are very tiny. A few radish seeds of an early maturing variety are usually planted with them to break the soil and indicate the positions of the rows, so that cultivation may be commenced early. The radishes are pulled when they reach edible size and the carrots given clean cultivation, the plants being thinned to stand two or three inches apart. When they reach edible size they are bunched and marketed. The larger growing kinds are planted in rows 24 to 30 inches apart and the plants thinned to 3 or 4 inches. When mature they are stored in pits or root cellars. Few diseases attack the carrot, and the few harmful insects are usually controlled by their parasites.

The average percentage composition of carrots is: Water 88.6; nitrogen-free extract, 7.6; carbohydrate, 1.3; protein, 1.1; fat, a trace; ash, about 1 per cent. They resemble other root and tuber vegetables in their succulence and nutritive value. They are greatly relished by stock, especially horses, but are usually replaced in American rations by cheaper foods.

Car'rotin. See CAROTIN.

Carrousel, kä-roo-sĕl', formerly an exhibition of various knightly exercises, as riding at the ring, throwing the spear, etc., which were celebrated at the courts of princes on festival occasions with great pomp and splendor. They are very ancient, but are first mentioned in history in 842, on occasion of the meeting held by Charles the Bold and Louis the German. They were superseded by tournaments, but when these had fallen were again revived. Their introduction or revival in France took place after tournaments had fallen out of fashion in consequence of the accident which ended in the death of Henry II. Similar fêtes had already



WILD CARROT.

long existed among the Moors, Spaniards, and Italians. These exhibitions were common during the continuance of the old French monarchy. The Place du Carrousel in Paris was so called from one of these fêtes given there in 1662, in honor of Mademoiselle de la Vallière. The greatest extravagancies were enacted at these displays. Recitations accompanied them, some verse in outrageous taste, and full of absurd allegorical personages, being usually recited in honor of the heroine of the fête, although genuine dramatic performances were sometimes given by professional actors. In the United States the name carrousel is applied to a merry-go-round, a machine with a revolving circular platform and fixed wooden horses, etc., upon which both children and grown people ride for amusement.

Carruth', Frances Weston, American writer: b. Newton, Mass., 12 July 1867. Since 1896 she has lived in New York, engaged in literary work. Her published volumes include: 'Those Dale Girls'; 'The Way of Belinda.'

Carruth, Fred Hayden, American journalist: b. Lake City, Minn., 1862. He was on the editorial staff of the New York *Tribune* 1888–92, and has been more recently editor of the humorous department of 'Harper's Magazine.' He has published 'The Adventures of Jones' (1895); 'The Voyage of the Rattletrap' (1896); 'Mr. Milo Bush and Other Worthies' (1899).

Carruth, William Herbert, American scholar: b. Ossawattomie, Kan., 5 April 1859. He was educated in the University of Kansas, and at Harvard, and has been professor of German in the former institution from 1887. He has published 'Schiller's Wallenstein with Introduction and Notes' (1894): and other German texts similarly edited.

Carruthers, kăr-roo'thẽrz, **William A.,** American novelist: b. Virginia, about 1800; d. Savannah, Ga., about 1850. He was professionally a physician, but wrote a number of spirited romances founded on incidents in American history. His best work is 'The Cavaliers of Virginia, or the Recluse of Jamestown, an Historical Romance of the Old Dominion' (1832). He is the author also of 'The Knights of the Horse-Shoe' (1845).

Carrying-trade, a phrase used in political economy, and also in commercial transactions. It usually refers to the commerce of different countries with each other, and is most frequently applied to carriage by sea. In a purely commercial sense the carrying-trade is simply the carriage of commodities from one place or country to another, irrespective of the mode of conveyance. In political economy the term is used in a special and restricted sense. In considering the entire commerce of a country it may be found that a part of that commerce is not directly with any one foreign country, but consists in supplying facilities for the conveyance of goods from one foreign country to another. The ships of the United States, for example, may be employed in carrying goods between India and China. This is called a carrying-trade. The carrying-trade does not consist merely in the occasional charter of vessels to foreign merchants for a foreign voyage. Though this may be included in it, its regular organization implies more than this. A shipowner, instead of lending his vessels incidentally to foreign merchants, may build or purchase them expressly for the purpose of conveying goods between different foreign ports at his own risk, and may even invest capital in merchandise to be so conveyed. It is to this abnormal development of commerce that the term carrying-trade in its restricted sense is applied. It is an investment of capital common in the case of commercial communities which have acquired great surplus wealth, or from the limited range of their territory, have few home investments. From the earliest time, the principal commercial communities, especially the great trading cities of antiquity, and those of the Middle Ages which have formed communities in themselves, have embarked largely in this kind of commerce.

Carryl, Charles Edward, American broker and author: b. New York, 30 Dec. 1841. He has been a member of the New York Stock Exchange from 1874 and has published 'Davy and the Goblin,' a very popular juvenile in the manner of 'Alice in Wonderland' (1884): 'The Admiral's Caravan' (1891).

Carryl, Guy Wetmore, American humorous writer: b. New York, 4 March 1873; d. New York 1 April 1904. He was a son of C. E. Carryl (q.v.), and the author of 'Fables for the Frivolous' (1898); 'Mother Goose for Grown-Ups' (1900); etc.

Carson, Christopher, popularly known as KIT CARSON, American mountaineer, trapper, and guide: b. Madison County, Ky., 24 Dec. 1809; d. Fort Lynn, Col., 23 May 1868. While yet an infant his family emigrated to what is now Howard County, Mo. At 15 years of age he was apprenticed to a saddler, with whom he continued two years, when he joined a hunting expedition. The next eight years of his life were passed as a trapper, which pursuit he relinquished on receiving the appointment of a hunter to Bent's fort, where he continued for eight years more. At the expiration of this time, he chanced to meet Fremont, by whom he was engaged as guide in his subsequent explorations. In 1847 Carson was sent to Washington as bearer of despatches, and received an appointment as lieutenant in the rifle corps of the United States army. In 1853 he drove 6,500 sheep to California, a difficult but successful undertaking, and on his return to Taos was appointed Indian agent in New Mexico. He served in the Federal army during the Civil War, attaining the rank of brevet brigadier-general.

Carson, Hampton Lawrence, American publicist: b. Philadelphia, Pa., 21 Feb. 1852. He was graduated at the University of Pennsylvania in 1871, and became a lawyer, rising speedily to prominence by speeches and addresses on topics of the time. He has written: 'History of the Supreme Court of the United States'; 'The Law of Criminal Conspiracies as Found in American Cases'; 'History of the One Hundredth Anniversary of the Promulgation of the Constitution of the United States'; and is a lecturer on law at the University of Pennsylvania.

Car'son City, Nev., a city, capital of the State and county-seat of Ormsby County; on the Virginia & Truckee R.R., 32 miles south-

east of Reno. The city is in a mining and agricultural district, and is the location of a branch mint, a Federal building, State capitol, State prison, an orphans' home, and an Indian school. The business is mainly connected with mining, agriculture, and lumbering. Here are railroad and machine shops, etc. Carson City is only 12 miles from Lake Tahoe, and, on account of its beautiful scenery at the base of the Sierra Nevada, is a popular summer resort. Pop. (1900) 2,100.

Carson River, a river of Nevada, rising in the Sierra Nevada and flowing northeast for about 150 miles. It then divides, and the main branch flows into Carson Lake, a small lake with no apparent outlet. The other branch flows in the opposite direction, and is lost in Carson Sink.

Carstairs, William, Scottish clergyman of political eminence: b. Cathcart, near Glasgow, 1649; d. 1715. He pursued his studies at the universities of Edinburgh and Utrecht. He returned to Scotland with the view of entering the ministry, but after receiving a license to preach resolved to return to Holland. As he was to pass through London, he was employed by Argyle and his party to treat with the English exclusionists and became privy to the Rye-house plot. On the discovery of that conspiracy he was apprehended. After a rigorous confinement in irons he was subjected to the torture, and endured this trial with great firmness; but being afterward deluded with the hopes of a full pardon, and assured that his answers should never be made evidence against any one, he submitted to make a judicial declaration. Being released he returned to Holland, and was received by the Prince of Orange as a sufferer in his cause. The prince made him one of his own chaplains, and procured his election to the office of minister of the English congregation at Leyden. He accompanied the prince in his expedition, and always remained about his person, both at home and abroad. During this reign he was the chief agent between the Church of Scotland and the court, and was very instrumental in the establishment of Presbyterianism, to which William was averse. On the death of William he was no longer employed on public business; but Anne retained him as her chaplain-royal, and made him principal of the University of Edinburgh. When the union of the two kingdoms was agitated he took a decided part in its favor. The memory of Carstairs is for the most part revered by his countrymen as that of an enlightened patriot; and few men of active power and influence have steered between parties more ably and beneficially.

Carstens, Asmus Jakob, Danish painter: b. St. Jürgen, near Schleswig, 10 May 1754; d. 26 May 1798. He was a miller's son, but received a superior education from his mother. He had a youthful passion for painting, but after his mother's death was placed in a mercantile house. After quitting his master, he went to Copenhagen, where he struggled on for seven years, supporting himself by portrait painting, at the same time working at a large historical picture on the 'Death of Æschylus.' He went to Italy after finishing this work, then lived at Lübeck for five years, toiling on in obscurity, when he was introduced by the poet Overbeck to a wealthy patron, by whose aid he went to Berlin, where the merit of his 'Fall of the Angels,' a colossal picture, containing over 200 figures, gained him a professorship in the Academy of Fine Arts. Two years' labor in Berlin enabled him to accomplish his cherished wish to go to Rome, and study the works of Michael Angelo and Raphael. His best works were designs in aquarelle, and painting in fresco; he rarely painted in oil. His cartoons at Weimar have been engraved by Müller. Homer, Pindar, Aristophanes, and Dante supplied him with his best subjects; and among the painters who endeavored to infuse a classic spirit into the fine arts of the 18th century, he holds a prominent position. His works are distinguished by correctness of form and outline, gracefulness of attitude, and loftiness and vigor of expression; but they frequently exhibit a certain harshness, arising from too close imitation. He was often defective in anatomy and perspective, and having begun late to paint in oil, was unacquainted with the secrets of coloring.

Cart, a carriage with two wheels, fitted to be drawn by one horse or other animal, and used in husbandry or commerce for carrying many sorts of goods. There are various descriptions of carts used in agriculture, and for many kinds of agricultural work the cart is preferable to the wagon. The ordinary cart for heavy goods has no springs, but there are many carts provided with springs.

Cartagena, kär ta jē'nā, Colombia, capital of the department of Bolivar, founded Jan. 21, 1533, by Pedro de Heredia. Early in the 17th century it ranked next below Mexico among the cities of the Western world, and was called "Queen of the Indies." At that time its inhabitants numbered about 20,000, of whom 3,000 were Spaniards; it was strongly fortified, and one of the main entrepôts of commerce between the hemispheres — a distinction due, in part, to its proximity to the Isthmian route, but even more to the excellence of its harbor, which is one of the best on the northern coast of South America. As the principal stronghold of Spanish America, it was repeatedly attacked: by a French fleet in 1544; by the English under Drake in 1585; again by the French in 1697; and by the English under Vernon in 1741. The town remained Spanish until 1815, when Bolivar took it; but the same year it was surrendered to the royalists, after a memorably heroic defense; and finally it was taken by Republican forces 25 Sept. 1821. Its population at present is little more than one half the number accredited to it three centuries ago. Cartagena is situated in lat. 10° 25′ 48″ N., lon. 75° 34′ W.

Cartagena, Spain, a city and fortified seaport and naval arsenal in the province of Murcia, and 31 miles south-southeast of the city Murcia. Its harbor is one of the largest and safest in the Mediterranean. The city, located at the northern end of the harbor, is surrounded by a lofty wall, flanked with bastions. The principal buildings are the cathedral, dating from the 13th century, now converted into a simple parish church; the old castle, supposed to date from the foundation of the city by the Carthaginians; the barracks, arsenal, presidio or convict establishment, the military hospital, the Hospital de Caridad, the artillery park, the

observatory, the convents of St. Augustine and Monjas, and several other convents and churches. Great improvements have been made recently in the accommodation for shipping by the construction of moles, wharves, breakwaters, and a floating dock. Lead smelting is largely carried on; and there are also in the neighborhood rich mines of excellent iron, which are connected with the harbor by means of a tramway about eight miles in length. Esparto grass, compressed by hydraulic power, is largely shipped; other exports are iron ore, lead and lead ore, copper ore, zinc ore, fruits, etc. Cartagena (ancient Carthago Nova) was founded by the Carthaginians under Hasdrubal about 228 B.C. It was taken by Scipio Africanus 210 B.C., and afterward became a Roman colony. In 425 A.D. the Vandals largely destroyed it; and in 711, after having been in possession of the Visigoths, it was again destroyed by the Saracens. When Spain possessed her colonies, and was in a flourishing condition, Cartagena was one of her most important naval stations, and carried on a very extensive commerce. In 1873 a body of communists obtained possession of the city and fortifications, but they were compelled to surrender in the following year. Pop., 100,000.

Cartago, kär-tä'gō, Colombia, a town in the valley of the Cauca, on the Viega, a tributary of that river. Its trade is principally in dried beef, pigs, fruits, coffee, cacao, and tobacco. The sugarcane thrives well here. Cartago is the entrepôt for the trade of Santa-Fe-de-Bogotà. The climate is hot, but dry and healthy. Pop. about 8,000.

Cartago, Costa Rica, a city, formerly capital of Costa Rica, on the right bank of a river of its own name, 14 miles east-southeast of San José. It was once a place of considerable commercial importance, and had a population of about 37,000. It was so ruined by an earthquake 2 Sept. 1841, that only 100 houses and a church were left standing. It had already been superseded both as a capital and a seat of commerce by San José. The railroad from San José to Limon passes through it. Near the town are the springs of Aguacaliente, and also Mount Cartago or Irazu, an active volcano, rising 11,480 feet above the sea-level. Pop. about 3,500.

Carte, Thomas, English historian: b. Clifton-upon-Dunsmoor, Warwickshire, April 1686; d. near Abingdon, 2 April 1754. He was educated at University College, Oxford, and Cambridge. His first publication was entitled 'The Irish Massacre Set in a Clear Light, etc.,' in which he defended Charles I. from the common charge of secretly instigating the rebellion and massacre in Ireland in 1641. During the rebellion of 1715, a warrant was issued for his apprehension, which he eluded by concealment; and later when it was supposed that he was concerned in a conspiracy, and a reward of £1,000 was offered for his capture, he escaped to France. Here he collected material for an English edition of the 'History of Thuanus' (de Thou). At length Queen Caroline procured leave for his return to England. His important work, the 'Life of James, Duke of Ormonde,' was published in 1735–6, and gained him great reputation, especially with the Tory party. In 1744 he was arrested on a suspicion of being employed by the Pretender, but was discharged. He published three volumes of his 'History of England' between 1747 and 1752, the fourth, which brought down the history to 1654, not appearing until after his death. The character of this work is deservedly high for research. Hume and other historians have been indebted to it, but the prejudices of the author are everywhere conspicuous.

Carte-blanche, kärt-blänch, a blank sheet of paper to be filled up with such conditions as the person to whom it is given may think proper; hence absolute freedom of action.

Carte de Visite, kärt dė vē-zēt, literally a visiting card, a photographic likeness executed on a card somewhat larger than a visiting card, and usually inserted in a photographic album. Cartes de visite were introduced by Disdéri in 1854.

Cartel', an agreement for the delivery of prisoners or deserters; also, a written challenge to a duel. A cartel-ship is a ship commissioned in time of war to exchange prisoners; also to carry proposals between hostile powers.

Car'ter, Elizabeth, English poet and linguist: b. Deal, 16 Dec. 1717; d. London, 19 Feb. 1806. She was the daughter of Dr. Nicholas Carter, a clergyman of Kent, and was educated by her father, soon becoming mistress of Latin, Greek, French, and German; to which she afterward added Italian, Spanish, Portuguese, Hebrew, and Arabic. She was for 50 years the friend of Dr. Johnson. Several of her poetical attempts appeared in the 'Gentleman's Magazine' before she attained her 17th year, and these procured her much celebrity. In 1739 she translated the critique of Crousaz on 'Pope's Essay on Man,' and in the same year gave a translation of Algarotti's explanation of the Newtonian philosophy. She published a translation of 'Epictetus,' in 1758.

Carter, Franklin, American educator: b. Waterbury, Conn., 30 Sept. 1837. He was graduated at Williams College in 1862, was professor of Latin there in 1865–72, and of German at Yale in 1872–81, and became president of Williams College 1882, resigning in 1901. He wrote a 'Life of Mark Hopkins' and a translation of Goethe's 'Iphigenia in Tauris.'

Carter, Sir Frederic Bowker Terrington, Canadian jurist: b. Saint John's, Newfoundland, 12 Feb. 1819; d. Saint John's 28 Feb. 1900. He was called to the Newfoundland bar in 1842, served in the Newfoundland assembly from 1855 to 1878, and two years later became chief justice of Newfoundland. He was knighted in 1878.

Carter, George B., American politician: b. Honolulu, Hawaii, 1866; was educated at Phillips Andover College and Yale University. In 1891 he was appointed Hawaiian consul at Seattle, Wash. He returned to Honolulu in 1896 and became active in island politics. He was appointed governor of Hawaii by President Roosevelt in 1903.

Carter, Henry. See Leslie, Frank.

Carter, James Coolidge, American lawyer: b. Lancaster, Mass., 14 Oct. 1827. He was educated at Harvard, and was admitted to the bar in New York in 1853. He was counsel for the city of New York in the famous case of the people against William Tweed, and in 1875 was appointed a member of the commission to devise a system of municipal rule for the cities

of the State of New York. He has published: 'The Proposed Codification of Our Common Law' (1884); 'The Provinces of the Written and the Unwritten Law' (1889); 'The Ideal and Actual Law' (1890).

Carter, James Madison Gore, American author: b. Johnson County, Ill., 15 April 1843. He was educated at the State Normal University, St. John's College, and Northwestern University Medical School. He served in an Illinois regiment during the Civil War, being captured and taken to Libby Prison. Among his works are: 'Outlines of Medical Botany of the United States'; 'Catarrhal Diseases of the Respiratory Organs'; and 'Diseases of the Stomach'; and various monographs on medical topics.

Carter, Louise Leslie, American actress. Her stage career began 10 Nov. 1890, when she appeared in the 'Ugly Duckling' in New York. Her other roles have been the Quakeress in 'Miss Helyett'; Maryland Calvert in 'The Heart of Maryland'; Zaza in 'Zaza'; and Madame Du Barry in 'Du Barry.' She is considered one of the leading actresses of the day. See Strang, 'Famous Actresses.'

Carter, Samuel Powhatan, American naval and military officer: b. Elizabethtown, Tenn., 6 Aug. 1819; d. Washington, D. C., 26 May 1891. He became a midshipman in 1840, fought in the Mexican war in coast attack, and in 1856 took part in the capture of the Barrier forts, Canton, China. In 1861 he was detailed to go to Tennessee, where he started the Tennessee brigade. All through the Civil War he was of great service to the government, and for his gallantry was brevetted major-general of volunteers. In 1882 he was promoted rear-admiral on the retired list.

Carter, Thomas Henry, American politician: b. Scioto County, Ohio, 30 Oct. 1854. He was bred to farming, but later became a lawyer, removing to Montana in 1882. He was Montana's first representative in Congress (1891), United States senator from that State from 1895 to 1901, chairman of the National Republican Committee in 1892–6, and was appointed in 1900 United States commissioner to the St. Louis Exposition.

Carter, William H., American military officer and author: b. Nashville, Tenn. In 1868 he entered the United States Military Academy. Successively promoted, he became in 1898 lieutenant-colonel and assistant adjutant-general. He served on the frontier from 1873–97, receiving a medal of honor for distinguished bravery in action at Cibicu Creek, Arizona, in 1881. In 1897 he became connected with the War Department. He wrote: 'Horses, Saddles, and Bridles'; 'Historical Sketch 6th United States Cavalry'; and 'From Yorktown to Santiago.'

Carteret, Antoine Alfred Désiré, än-twän al-frā dā-zē-rā kär-tē-rā, Swiss statesman and fabulist: b. Geneva, 2 April 1813; d. there, 31 Jan. 1889. His political career was long and brilliant; and in literature he has made a name with pleasing 'Fables' (1873), frequently treating political subjects, and a novel, 'Two Friends' (1872), descriptive of Genevese customs.

Carteret, kär'tē rĕt, Sir **George,** English provincial proprietor: b. St. Ouen, Jersey, between 1609–17; d. 14 Jan. 1679. He had a distinguished career in the British navy, was an active supporter of the royalist cause, was made lieutenant-governor of the island of Jersey and vice-admiral. He manifested an interest in colonization and received a royal grant, "in perpetual inheritance," of certain lands in America "to be called New Jersey," the name being taken from the island of which he had been governor. In 1651 he surrendered to the commonwealth and served for a time in the French navy, returning to England at the restoration. He was made treasurer of the navy in 1661 and suspended in 1669 for mismanagement of funds. In 1664 he was made joint proprietor with Lord Berkeley of the province of New Jersey under a grant from the Duke of York, and in 1676, when the province was divided, East Jersey fell to his share. He was one of the first proprietors of Carolina.

Carteret, John, Earl Granville, British statesman: b. 22 April 1690; d. Bath, 2 Jan. 1763. He received his education at Westminster School and Christ Church College, Oxford. From Oxford he proceeded to London, plunged into the political and social excitements of the period, made the acquaintance of Swift, and in 1710 married Lady Frances Worsley. Entering the House of Lords on 25 May 1711, as second Baron Carteret, he espoused the side of the Whigs, then led by Stanhope and Sunderland, and in 1714 made his first speech in the House of Lords in support of the Protestant Succession. On the accession of George I. Carteret became a lord of the bedchamber. In 1719 he was appointed by Stanhope, ambassador extraordinary to Sweden, and succeeded in arranging two treaties of peace, the first between Sweden, Hanover, and Prussia, and the second between Denmark and Sweden. In 1721 he was appointed to one of the two foreign secretaryships, that for the "Southern Department" of Europe, and as such, attended, in 1723, the congress of Cambria, which attempted the settlement of differences between Germany and Spain, and accompanied George I. to Berlin. In 1724 Carteret was appointed lord-lieutenant of Ireland. Though he came into collision with Swift over the Drapier prosecution, the two ultimately became warm friends. Between 1730 and 1742 Carteret took the lead in the House of Lords of the party opposed to Sir Robert Walpole. When this opposition succeeded in overthrowing Walpole, Carteret became the real head of the administration, but was driven from power by the Pelhams in 1744. In the same year he became Earl Granville on the death of his mother, who had been created Countess Granville in her own right.

Carteret, Philip, English provincial governor: d. 1682. He was appointed governor of the province of New Jersey by the proprietors, Berkeley and George Carteret, and was given power to grant land to settlers. He reached New Jersey in 1665, bringing with him about 30 settlers, and settled at Elizabethtown. He avoided trouble with the Indians by adopting the wise policy of buying the land from them or requiring the colonists to do so. In 1672 he went to England for a time, but returned in 1674, and during his absence New Jersey was in the possession of the Dutch for a year, 1673–4. In 1676 when the division of the prov-

ince into East and West Jersey was completed, he became governor of East Jersey, holding the position till his death. Owing to conflicting claims of New Jersey and New York, he had frequent quarrels with Andros, who attempted to deprive him of his commission.

Carteret, Philip, English navigator: d. Southampton, England, 21 July 1796. He was in the expedition commanded by Wallis, in 1766, on a voyage of discovery to the South Seas. He discovered Queen Charlotte's Isles, and other isles, two of which he called Gower and Carteret. A description of his voyage was given by Hawkesworth in the introduction to his narrative of Capt. Cook's first voyage (1773).

Cartesian Diver, Devil, or **Bottle-Imp,** a contrivance to illustrate the effect of the compression or expansion of air in changing the specific gravity of bodies. It is a small glass figure, hollow, and sometimes provided with a hollow bulb on its head. This is to be partly filled with water, and placed in a tall vessel, nearly full of water, and having a piece of caoutchouc secured tightly over the top. On pressing the caoutchouc the air of the vessel will be compressed; this will compress that within the figure or bulb, so admitting more water by a small aperture, and causing the figure to sink. On removing the pressure the air in the figure or bulb will expand, forcing out some of the water, and causing it to rise.

Carte'sian Oval, the name, from their earliest student, Descartes, applied to a family of curves defined as the locus of a point whose distances from two fixed points bear a stated relation to each other. The ellipse is a familiar example, though it was known and studied long before it was grouped with the cartesians.

Carte'sianism, the system of philosophy taught by René Descartes (q.v.). At the age of 20, Descartes resolved as far as possible to eliminate from his mind all that he had ever learned from books or instructors, and to think out for himself the entire circle to knowledge. His first postulate was *Cogito, ergo sum* — "I think, therefore I exist." Inquiring next into ideas, which he defined as "all that is in our mind when we conceive a thing, in whatever way we conceive it," he regarded clearness and distinctness as the criterion of a true as distinguished from a false idea. Of all ideas in the human mind that of a God is the clearest, therefore there is a God. As in this clear conception of God infinite veracity is attributed to him, it is impossible that he could make our faculties deceive us in mathematical and metaphysical demonstrations; these sciences, therefore, are trustworthy. The actual existence of the external world is proved by the prior truth, the existence of God. Creation was and is a manifestation of the divine will. Descartes revolutionized mathematics, imparting to it a beneficial impulse. He did likewise to metaphysics. Among his immediate followers in the latter science were Geulincx, Malebranche, and Spinoza. A celebrated opponent was Gassendi. The method of Descartes was adopted by all the philosophers of the rationalistic school who flourished during the latter half of the 17th and the whole of the 18th centuries. In physics he discovered the law of the refraction of a ray of light through a diaphanous body, but his *a priori* method was not the proper instrument for physical investigation, and his researches in that department were comparative failures.

Car'thage (conjectural native name, the Phœnician *Kereth-hadeshoth,* new city, from which the Greek *Karchēdon,* and the Roman *Carthago* are supposed to have been derived), the most famous city of Africa in antiquity, capital of a rich and powerful commercial republic. It was situated on the north coast, not far from the modern Tunis. According to tradition, Dido, fleeing from Tyre, came to this country, where the inhabitants agreed to give her as much land as could be compassed by an ox-hide. Dido cut the hide into small thongs, with which she enclosed a large piece of land. Carthage was founded, according to Aristotle, 287 years later than Utica. Becker supposes it to have been a joint colony or factory, in the Anglo-Indian sense, of Tyre and Utica. The actual date of its foundation is much contested. The uncertainty is accounted for probably by the gradual growth of the city, as well as by the diversity of epochs reckoned from, and the different calendars, or modes of computing time, used by the different chroniclers. The date commonly given is 878 B.C. The history of Carthage is usually divided into three periods. The first is the epoch of its gradual rise; the second that of the struggles with other states occasioned by its extended power; the third that of its decline and fall. These epochs interlock each other, and it is only as a matter of convenience that we can interpose exact dividing dates between them. The first epoch has been extended as far as to 410 B.C.; the second limited to the period chiefly distinguished by wars with Greece, 401–265; the third is the period occupied with the Roman wars, and ending with the fall of Carthage.

Carthage appears early to have been independent of Tyre, if ever she owned any direct dependence on the mother city. There existed, however, a close relationship between them, due to affinity of race and religion. This appears from various incidents in their history, as when the Tyrians refused to follow Cambyses in a contemplated attack on Carthage, and when Alexander, having attacked Tyre, the women and children were sent to Carthage. Tyre also appears as an ally of Carthage in her second treaty with Rome; and an annual offering was sent from Carthage to Tyre for the Temple of Hercules, to the neglect of which in periods of prosperity, subsequent calamities were often attributed. There is no evidence that the government of Carthage was ever monarchical. She appears soon to have acquired an ascendency over the earlier Tyrian colonies, Utica, Tunis, Hippo, Leptis, and Hadrumetum. This was probably gained without any effort, as the result of her material prosperity. Placed amid foreign and often hostile tribes, the African colonies of Tyre might have slight jealousies and rivalries among themselves, but their relations must, on the whole, have been friendly and confidential, and in the earlier stages of their history at least they would naturally follow the lead of the strongest among them. The rise of Carthage, then, may be attributed to the superiority of her site for commercial purposes, and the enterprise of her inhabitants. Her relations with the

native populations, as is evident from her subsequent history, would always be those of a superior with inferior races. Some of them were directly subject to Carthage, others contributed to her strength by recruiting her armies, although frequently in hostility with her. She established colonies for commercial purposes along the whole northern coast of Africa, west of Cyrenaica, and these colonies enabled her to maintain and extend her influence over the native tribes. These colonies, together with most of the earlier Phœnician colonies subject to her, possessed little strength in themselves, and easily fell a prey to an invader; hence they were in the end a source of weakness, although it is not easy to see how her prosperity could have been attained without them. It is only after the north of Africa has thus been placed at her command that Carthage appears formally on the stage of history. One of her earliest recorded contests is that with Cyrene, when the boundary between the two states was fixed, to the advantage of Carthage, at the bottom of the Greater Syrtis, the Carthaginian envoys, according to the traditional story, consenting to be buried on the spot. The immediate wants of the city were provided for by the cultivation of the surrounding territory, which alone was directly dependent on her.

Commerce naturally led Carthage to conquest. The advantages, both for the promotion and protection of her trade, of possessing islands in the Mediterranean, led to her first enterprises. Expeditions to Sicily and Sardinia appear to have been undertaken before the middle of the 6th century. The war was carried on in the latter half of this century by Mago, and his sons Hasdrubal and Hamilcar. At the same time a war arose with the Africans on account of the refusal of the Carthaginians to continue the payment of a ground-rent for their city. In this the Carthaginians were unsuccessful, but at a subsequent period they achieved their object. Sardinia was their first conquest. They guarded it with the utmost jealousy. The Romans, by the first treaty 509 B.C., were allowed to touch at it; but this permission was withdrawn in the second. It was the entrepôt of their trade with Europe, and lessened their dependence on their own territory for corn. They founded its capital, Caralis, now Cagliari. They soon after occupied Corsica, where they united with the Tyrrhenians, its previous possessors, against the Greeks. Sicily was already occupied by Greek and Phœnician colonies. The latter, on the decline of Tyre, seem to have fallen under the dominion of Carthage, which gave her a footing on the island. The Greeks were still the more powerful party, and the Carthaginians occupied themselves in promoting dissensions among their cities. When the Greeks were occupied with the Persian invasion, they organized a great expedition to take possession of the island, in which they landed 300,000 men, contributed by all their dependencies. Among these Sardinians, Corsicans, and Ligurians, the latter from the gulfs of Lyons and Genoa, are enumerated. They were totally defeated by Gelon, tyrant of Syracuse, and their leader slain, in the battle of Himera, 480 B.C. The Balearic, and many smaller islands in the Mediterranean, had already been occupied by the Carthaginians. Spain had also been colonized by them with peaceable commercial settlements. No other great enterprise took place in the first period of her history.

The war with the Greeks in Sicily was renewed in 409. Hannibal, the son of Gisco, landed an army at Lilybæum, in the spring of that year, and reduced Selinus and Himera. In a subsequent expedition Agrigentum was subdued. A pestilence seconded the efforts of Dionysius and saved Syracuse, 396 B.C. A treaty put an end to the war in 392. The struggle between the Greeks and the Carthaginians continued with varying success throughout the remainder of this period. Its most remarkable event was the invasion of Africa by Agathocles, 310 B.C. Defeated in Sicily by the Carthaginians, to avert the total ruin of his affairs, he raised an army and passed over to Africa. The most extraordinary success awaited him, showing at once the weakness of the hold which Carthage had of her external possessions on the continent, and the danger she constantly encountered from factions and dissensions within the city itself. Agathocles was the precursor of Scipio. After the death of Agathocles the Carthaginians renewed their enterprise in Sicily, and had nearly completed its conquest when the Greeks called in the aid of Pyrrhus, who for a time arrested their progress 277–5 B.C. Notwithstanding numerous and disastrous defeats in their contests with the Greeks, the Carthaginians seemed, after the departure of Pyrrhus, to have the conquest of Sicily at length within their power. A dissension with the Mamertines, their former allies, called in the Romans, and with their invasion, 264 B.C., the third period of Carthaginian history begins.

The first Punic war, in which Rome and Carthage contended for the dominion of Sicily, was prolonged for 23 years, 264 to 241 B.C., and ended, through the exhaustion of the resources of Carthage, in her expulsion from the island. The second Punic war, conducted on the side of the Carthaginians by the genius of Hannibal, lasted 17 years, 218 to 201 B.C., and after just missing the overthrow of Rome, ended in the complete humiliation of Carthage. The policy of Rome, at the end of this war, in placing Carthage, disarmed, at the mercy of her African enemies, and raising her a powerful opponent in Masinissa, occasioned the third Punic war, in which Rome was the aggressor. It lasted only three years, but served to throw a halo of glory round the fall of the republic, in whose total ruin it ended. This war, begun 150 B.C., was ended 146 B.C., in the destruction of Carthage.

The repeated and not always unsuccessful struggles of Carthage with her African neighbors, in the very midst of her schemes of foreign conquest, indicate the marvelous tension to which a power inherently so weak was wrought in those great enterprises which virtually grasped at the supremacy of the world. In this matter the experience of Carthage was not unparalleled by that of Rome; but the great difference between them was that the former was surrounded by alien tribes, the latter by races kindred in language and manners, with whom, after conquest, she could easily unite. The invasion and conquest of Spain, begun by Hamilcar and carried on by Hasdrubal and Hannibal, and which led to the second Punic war, can only be mentioned in passing.

Carthage perished leaving no historians to tell her tale; hence many interesting circumstances in her history can never be known, and

what is preserved has the color of partial and often hostile authority. The constitution of Carthage has occupied much of the attention of scholars, but still remains in many points obscure. The name of king occurs in the Greek accounts of it, and the first Carthaginian general who is recorded to have invaded Sicily and Sardinia is called Malchus, the Phœnician for king, but the monarchical constitution, as commonly understood, never appears to have existed in it. The officers called kings by the Greeks were two in number, the heads of an oligarchical republic, commonly called suffetes, the original name being considered identical with the Hebrew *shofetim,* judges. These officers were always chosen from the principal families, and were elected annually. It is not known if they could be re-elected. There was a Senate of 300, and the citizens were divided into classes similar to the Roman tribes, curiæ, and gentes. There was a smaller body of 30 chosen from the Senate, sometimes another smaller council of 10. Various other officers are mentioned, but the particulars regarding them are often obscure, and sometimes contradictory. There seems to have been an appeal to the people in certain circumstances, but the power at first lay almost exclusively in the hands of the oligarchy. The constitution worked well during the early part of the history of Carthage, but in its later ages the state was divided by bitter factions, and liable to violent popular tumults. Both Hamilcar and Hannibal, in their most important enterprises, experienced the opposition of the aristocratic party, led by Hanno, the head of a rival family, who appears to have been for a long period a consistent advocate of alliance with Rome.

After the destruction of Carthage, her territory became the Roman province of Africa. A curse was pronounced upon the site of the city, and any attempt to rebuild it prohibited. The attempt was, however, made 24 years after her fall, by Caius Gracchus, one of the leading men of Rome. The same plan was entertained by Julius Cæsar, and it was accomplished by Augustus. The new city became the seat of the proconsul of Old Africa in place of Utica, and continued to flourish till the Vandal invasion. It became distinguished in the annals of the Christian Church. Cyprian was its bishop, and Tertullian is supposed to have been a native of it. It was taken and destroyed by the Arabs, under Hassan, in 647.

The religion of the ancient Carthaginians was essentially that of their Phœnician ancestors. They worshipped Moloch or Baal, to whom they offered human sacrifices; Hercules, the patron deity of Tyre and her colonies; Astarte, and other deities, which were identified with the heavenly bodies, but propitiated by cruel or lascivious rites. Their religion was considerably modified by their intercourse with the Greeks. After their defeat by Gelon he made it a condition of peace with them that they should abandon human sacrifices. Some of their deities were identified with those of the Greeks, and they adopted others of that people, and no doubt received also some of their ideas regarding them. See Arnold's and Mommsen's histories of Rome; R. B. Smith, 'Carthage and the Carthaginians'; A. Church, 'Carthage, or the Empire of Africa'; N. Davis, 'Carthage and Her Remains.'

Carthage, Mo., a city and county-seat of Jasper County, in the southwestern part of the State, situated on Spring River and on the St. Louis & S. F. and the Missouri Pac. R.R.'s, 300 miles southwest of St. Louis. It is the centre of an extensive lead region, and in addition to zinc mines and stone and lime works has flour mills, machine-shops, foundries, and various other manufactories. Carthage has a public library, parks, national banks, daily and weekly newspapers, good public schools, and is the seat of Carthage College. It is located in one of the most attractive regions of the southwest, and in recent years great public improvements have added to the handsome appearance of the city. The cultivation of gardens has been stimulated by premiums from a popular fund, and the beautifying of the city has been most remarkable. Carthage is a place of historic note on account of an engagement which occurred in the vicinity during the Civil War. Pop. (1900) 9,416. See CARTHAGE, BATTLE OF.

Carthage, Battle of. On 17 June 1861, Gen. Nathaniel Lyon, U. S. A., drove the Confederates from Booneville, Mo., and Claiborne F. Jackson, the disloyal governor of Missouri, ordered a concentration of the State troops, who adhered to him, in the southwestern part of the State, to unite with the Arkansas troops, under the command of Gen. Ben. McCulloch. Anticipating McCulloch's movement into Missouri, Lyon ordered Gen. T. W. Sweeny, with three Union regiments, a small detachment of regulars, and some artillery, from St. Louis to Springfield. These were pushed forward by rail to Rolla and thence by road, and 28 June Col. Franz Sigel, with the 3d Missouri, arrived at Sarcoxie, southwest of Springfield, and 15 miles southeast of Carthage, Jasper County, an important strategical point, where it was anticipated that Jackson and McCulloch would endeavor to unite forces. Here Sigel learned that Gen. Sterling Price, with about 800 Missourians, was near Neosho, 22 miles south, and that Jackson, with other State troops, was to the north, 15 or 20 miles beyond Lamar, marching south. He concluded to move first on Price to disperse him, and then turn north on Jackson, his object being to prevent a junction of the two forces, and to open communication with Lyon, who was marching south from Booneville; but when he started after Price, on the morning of the 29th, he heard that he had retreated to join McCulloch, upon which he turned his thoughts toward Jackson, but continued his march to Neosho, where he was joined a few days later by Col. Salomon, with the 5th (Union) Missouri. Capt. Conrad's company of the 3d was left to hold Neosho, and on the 4th of July Sigel, with the two regiments and two batteries, of four guns each, marched to Spring River, a short distance southeast of Carthage, where he heard that Jackson, with over 4,000 men, was but nine miles in his front in the direction of Lamar. On the morning of the 5th, with about 1,000 men and eight guns, he advanced slowly, his train three miles in the rear, driving back the enemy's mounted skirmishers, and about nine miles beyond Carthage came upon Jackson's troops in line of battle on elevated ground, four divisions under command of Gens. James S. Rains, John B. Clark, M. M. Parsons, and W. Y. Slack, numbering nearly 5,000 men, 1,200 of whom were unarmed. About

1,800 were mounted men, armed with shotguns, and judiciously posted on the flanks of the infantry. Jackson had eight guns. After some skirmishing Sigel, at 10 o'clock, brought up seven guns and opened fire, which was promptly returned, but not effectively, for, being in want of proper ammunition, the Confederate guns were charged with pieces of chain, iron spikes, broken iron, and round stones or pebbles. After a desultory artillery fire of three hours the Confederate horsemen advanced from both flanks and making a wide circuit, to avoid Sigel's artillery, began to close in on him and threaten his train, whereupon, disposing four guns in rear and two on either flank he fell back, greatly harassed at every step, until he reached Carthage, where he made a stand. But, as the enemy were still pressing hard on him, working on both flanks and threatening the road to Springfield, he again fell back, skirmishing all the way, some two or three miles beyond Carthage, where pursuit ended, and Sigel marched to Sarcoxie, and thence by way of Mount Vernon to Springfield, where Lyon joined him on the 13th. The Union loss was 13 killed and 31 wounded, to which must be added the loss of Conrad's company of 94 men surprised and captured at Neosho, on the 5th, by Churchill's Arkansas regiment of McCulloch's command. The Confederate loss was about 30 killed and 125 wounded. The day after the engagement Jackson marched from Carthage and met McCulloch and Price coming to join him. Consult: Official Records, Vol. III.; the Century Company, 'Battles and Leaders of the Civil War,' (Vol. I.). E. A. CARMAN.

Carthage College, Carthage, Ill., a coeducational institution organized in 1870 under the auspices of the Lutheran Church. At the end of 1902 it reported: professors and instructors, 14; students, 250; volumes in the library, 5,000; grounds and buildings valued at $100,000.

Carthage'na. See CARTAGENA.

Car'thamin, or **Car'thamine,** the coloring-matter of safflower (*Carthamus tinctorius*), from which it is extracted by the action of sodium carbonate, which is subsequently neutralized by the addition of acetic acid. The carthamin is removed from the solution by the addition of cotton cloth, to the fibres of which it adheres strongly, coloring them a fine red when the solution from which it is deposited is acid, and yellow when it is alkaline. The carthamin may be removed from the cotton by the action of sodium carbonate, and may then be precipitated in a comparatively pure state by the addition of citric acid. When thus prepared, carthamin is a powder, red or golden green in color, very slightly soluble in water or ether, but dissolving readily in alcohol, with the formation of a purple solution. Mixed with French chalk it is used as a rouge. It has the chemical formula $C_{14}H_{16}O_7$.

Carthu'sians, an order of monks in the Roman Catholic Church, founded in 1084 by Bruno (St. Bruno), a priest of the diocese of Rheims and principal of the theological school there. What specially prompted Bruno to retire from the world was the openly confessed contempt of his bishop for piety and religion. It was a saying of this bishop that while it was a fine thing to be archbishop of Rheims, it was too bad that he had to sing masses. Bruno, with a little band of his friends, who were of the same mind with him, sought solitude in the diocese of Grenoble, and settled in a wilderness near that city called the *Cartusium.* It was a region of terrible aspect, with naked and precipitous rocks surrounded by sterile hills; and the poet Gray, in the five Latin Alcaic stanzas which in 1741 he wrote in the album of the monastery of Cartusium or La Grande Chartreuse, notes the austere features of the locality in terms which recall the picture drawn of it by Bruno's contemporaries, the *invias rupes,* the *fera juga,* the *clivos præruptos,* the *nemorum noctem* (impassable cliffs, rugged mountains, precipitous heights, gloomy forests). His institute was the most rigorous of all the monastic orders, and the Carthusians might boast — were they given to boasting — that theirs is the only monastic order that never has had to undergo reformation to bring it back to its first rigor. Bruno gave his community a rule of life which was not committed to writing: it prescribed perpetual silence, abstinence from flesh-meats, habitual wearing of the cilicium or horsehair shirt, and the like austerities. But he retained withal his love of letters, and communicated to his brethren a taste for science and learning. Besides the customary religious exercises of all monastic institutes, his monks were required to occupy a part of the time in manual labor and the other part in the work of transcribing the ancient authors and the more important public documents and records of the time. Before long there was founded in the wilderness of the *Cartusium* a collateral branch for women recluses, under substantially the same rule.

A written rule was given to the Carthusians by Guigo, fifth prior of the Cartusium — the head of a Carthusian institute is always prior, not abbot — in 1129. It forbids the practice of austerities not prescribed by the founder and establishes in perpetuity the provisions of Bruno's rule. Guigo wrote a 'Manual for Monks' in which he names reading, meditation, prayer, and contemplation as the means of reaching the perfection of the Christian and religious life. The original establishment, the Cartusium, or La Grande Chartreuse, contributed to the mother house of the order continuously, the troublous time of the Revolution excepted, down to the year 1903, when under the law for regulation or suppression of monastic houses in France, the religious community was dispossessed and turned out of the home in which it had lived during more than 800 years. The latest rule of the order of Carthusians dates from 1581. In many respects it is not as rigorous as the rule given by Bruno and Guigo. The use of linen is still forbidden, the abstinence from flesh-meats is still enforced, as is also the rule of silence. The Carthusian "house" is still an assembly of detached small houses or cells comprised within an enclosure, with a patch of ground around each little house. The general of the Carthusians resides — rather till the expulsion of the inmates did reside — at La Grande Chartreuse, not at Rome, as do the generals of most of the religious orders.

Cartier, SIR **George Etienne,** Canadian statesman: b. St. Antoine, Verchères County, Quebec, 6 Sept. 1814; d. London, 21 May 1873. Educated at the College of St. Sulpice, Montreal,

he was admitted to the bar in 1835, took part in the rebellion of 1837, and in consequence had for a time to leave Canada. In 1848 he entered the Canadian Parliament as representative of his native county, and in 1856 became provincial secretary. Later in the same year he became attorney-general for Lower Canada, in which post he was active in behalf of legal reforms. In 1857 he was a member of the Macdonald ministry, and in 1858 became premier, remaining in this position, except for a few days, till 1862. In 1864 he declined the premiership, but accepted the office of attorney-general. He was active in bringing about the establishment of the Dominion of Canada in 1867, and held the office of minister of defense in the first Dominion cabinet. In 1868 he was created a baronet.

Cartier, Jacques, French navigator: b. St. Malo, 31 Dec. 1491; d. 1557. After gaining some experience in fishing-fleets off the Labrador coast, he commanded an expedition to North America in 1534, entering the Strait of Belle Isle, and took possession of the mainland of Canada in the name of Francis I. The next year he sailed up the St. Lawrence as far as the present Montreal. In 1541 he went out as captain-general in command of a first detachment of ships to prepare the way for Roberval, who had been named viceroy. Finding, however, that his chief did not arrive, after he had waited some time, he returned to St. Malo. The natives usually received him well, but when about to return from his second voyage he treacherously kidnapped Donnaconna, one of the chiefs, and some others, in order to show them in his native country. His book, 'Discours du Voyage fait par le Capitaine Jacques Cartier aux Terres neufves de Canada,' was published in 1598.

Cartilage, one of the primary tissues of animal structures, of the connective-tissue class, characterized by its peculiar basement substance. The most abundant form of cartilage is the hyaline variety, but there are also fibrous and fibro-elastic cartilages. Hyaline cartilage, particularly abundant on the ends of the bones, is whitish and translucent, firm and elastic. The cells are imbedded in an abundant homogeneous basement substance which is made up largely of chondrin. Fibrous cartilage is less abundant, and its basement substance is fibrillated. It is found about the intervertebral cartilage masses, about the joints, and around the tendons of some of the larger muscles. The fibro-elastic form is found only in certain structures,—the epiglottis, the larynx, the Eustachian tube, and in the external ear. Cartilage tissues protect the ends of the long bones by reason of their firm elasticity. They provide strong, firm, and yet movable structures where bone, by reason of its rigidity, would not be serviceable, as in the epiglottis, larynx, etc.

Carton, Florent. See DANCOURT.

Carton, Sydney, the hero in Dickens' 'Tale of Two Cities.'

Cartoon (It. *cartone,* from Lat. *charta,* paper), a term having various significations. In painting, it denotes a sketch on thick paper, pasteboard, or other material, used as a model for a large picture, especially in fresco, oil, tapestry, and sometimes in glass and mosaic. In fresco painting, cartoons are particularly useful, because in this a quick process is necessary, and a fault cannot easily be corrected. In applying cartoons, the artist commonly traces them through, covering the back of the design with black-lead or red chalk; then, laying the picture on the wall or other matter, he passes lightly over each stroke of the design with a point, which leaves an impression of the color on the plate or wall; or the outlines of the figures are pricked with a needle, and then, the cartoon being placed against the wall, a bag of coal-dust is drawn over the holes, in order to transfer the outlines to the wall. In fresco painting, the figures were formerly cut out and fixed firmly on the moist plaster. The painter then traced their contour with a pencil of wood or iron, so that the outlines of the figures appeared on the fresh plaster, with a slight but distinct impression, when the cartoon was taken away. In the manufacture of a certain kind of tapestry the figures are still cut out, and laid behind or under the woof, by which the artist directs his operations. In this case the cartoons must be colored. In very modern times the term is commonly applied to pictures caricaturing notable characters or events of the moment. See CARICATURE AND CARICATURISTS.

The most famous cartoons in existence are those executed by Raphael for the celebrated tapestries of the Vatican, which were made at Arras, and hence called Arazzi. Two sets of these tapestries were ordered by Leo. X., one for the Vatican and the other for presentation to King Henry VIII. The second set, or fragments of it, are still in existence on the Continent. The cartoons lay for a time neglected at Arras, and have repeatedly fallen into neglect again, so that out of 25, the original number, only seven remain, and these have had to be restored. They were purchased at the advice of Rubens by Charles I. about 1630. On the sale of his effects they were purchased by the order of Cromwell for the nation, but again fell into neglect in the time of Charles II. William III. had them restored, and built a gallery for them at Hampton Court, where they remained, until in 1865 they were lent to the South Kensington Museum. The subjects of the seven are: (1) Paul Preaching at Athens; (2) The Death of Ananias; (3) Elymas the Sorcerer Struck with Blindness; (4) Christ's Charge to Peter; (5) The Sacrifice at Lystra; (6) Peter and John Healing the Cripple at the Beautiful Gate of the Temple; (7) The Miraculous Draught of Fishes. The cartoons have been repeatedly engraved, among others by Dorigny, Holloway, and Gribelin. They have also been extensively made known by photographs.

The cartoon of the School of Athens, carried to Paris by the French, and a fragment of the Battle of Maxentius and Constantine, are preserved in the Ambrosian Gallery at Milan. There are, likewise, cartoons by Giulio Romano in the Sala Borgia, by Domenichino and other Italian masters, who caused their pictures to be executed, in a great degree, by their scholars, after these cartoons. The value set upon cartoons by the old Italian masters may be seen by Giovanni Armenini's 'Precetti dello Pittura' (1687). In later times large paintings, particularly in fresco, were not executed so frequently. The artists also labored with less care, and formed their great works more from small sketches. In modern times some German artists have prepared accurate cartoons. Among them is Cornelius,

whose cartoons for his fresco paintings in Munich have acquired much celebrity. He prepared, too, a cartoon for the fresco picture representing 'Joseph Interpreting the Dream.' Overbeck and Julius Schnorr may also be mentioned for their cartoons.

Cartouche, Louis Dominique, loo-ē dŏm-ĭ-nēk kär-toosh, French robber: b. Paris, about 1693; d. Châtelet, France, 28 Nov. 1721. He was the leader of a noted company of robbers, and being captured was broken alive on the wheel in 1721. His life has formed the subject of a modern French drama, and was formerly represented on the English stage.

Cartouche, or **Cartouch** (French *cartouche*). (1) A wooden case about three inches thick at bottom, and girt round with marline, holding 200, 300, or 400 musket-balls, with 8 or 10 iron balls weighing one pound each, to be fired from a mortar, gun, or howitzer for the defense of a pass, retrenchment, etc. Such missiles have been superseded. In French military language cartouche signifies the entire charge of a firearm. (2) In architecture, sculpture, etc., an ornament representing a scroll of paper, being usually in the form of a table, or flat member, with wavings, whereon is some inscription or device. (3) The name given by the French literati to that oval ring or border which includes, in the Egyptian hieroglyphics, the names of persons of high distinction. (4) In heraldry a name given to a sort of oval shield, much used by the Popes and secular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on.

Cartridge, a case of paper, parchment, metal, or flannel suited to the bore of firearms, and holding the exact charge, including, in the case of small arms, both powder and bullet (or shot). In loading with the old style of cartridge for muzzle-loading rifles, the paper over the powder was bitten or twisted off and the powder poured in, the bullet being then inserted and rammed home. The cartridges used for breech-loading rifles contain the powder in a case of solid brass, and have the percussion-cap by which they are ignited fixed in the base. Such cases can be refilled and used a number of times in succession. Cartridges for shot-guns are similar to those for rifles, but are usually of less solid construction, being commonly of strong paper with a base of metal. Those for large guns are usually made of flannel and contain only the powder. Blank-cartridge is a cartridge without ball or shot. Cartridges for blasting are filled with dynamite or other explosive.

Cartridge-paper, a thick paper originally made for the manufacture of cartridges, but extensively used in the arts, its rough surface giving it an advantage for drawing upon, as a wall paper, and for other purposes.

Cartwright, Edmund, English inventor: b. Marnham, Nottinghamshire, 24 April 1743; d. Hastings, Sussex, 30 Oct. 1823. He was educated at University College, Oxford, and having taken orders in the Church, obtained first the living of Brampton, near Chesterfield, and afterward that of Goadby-Marwood, in Leicestershire. It was, however, only after he had reached 40 years of age that his attention was first turned to the subject on which his claim to remembrance is founded. In the summer of 1784 he began to investigate the subject of mechanical weaving, and experiment regarding improvements. His efforts were crowned with success, and in April of the following year he brought his first power-loom into action. It was not, in fact, in respect of economy of labor, any advance upon the ordinary hand-loom; but the idea which subsequent improvements have carried so far in advance of hand-loom weaving was there. The introduction of Cartwright's loom was opposed both by manufacturers and workmen; and the first mill erected for them, containing 500 looms, was burned down. His attention once turned in the direction of mechanical improvement, he continued to make progress in discovery. He not only perfected his power-loom, but took out 10 patents for different inventions, among which was one for combing wool. He expended much of his means in these investigations, and in 1809 he received as an acknowledgment of their value a grant from Parliament of £10,000, which relieved him from straitened circumstances, although, it is said, it did not cover his expenditure. He also received premiums for various improvements from the Society of Arts and the board of agriculture.

Cartwright, John, English reformer, brother of Edmund Cartwright (q.v.): b. Marnham, Nottinghamshire, 17 Sept. 1740; d. London, 23 Sept. 1824. He entered the navy in 1758, and became a first lieutenant in 1766. In 1774 his attention was turned to politics. In his 'Letters on American Independence' (Independence of America considered as supremely useful and glorious to Great Britain), written in this year, he advocated a union between the colonies and the mother state, under separate legislatures, and argued this great question on the foundation of natural, inherent right; maintaining "that the liberty of man is not derived from charters, but from God, and that it is original in every one." In 1775 he was appointed major of the Nottinghamshire militia, and after several ineffectual attempts on the part of government to remove him from that post, his dismission was finally accomplished in 1792, in consequence of an act of Parliament. In the American war Lord Howe was desirous of having him with him in America; but Major Cartwright, although always eager for promotion in the navy, refused the proposal, alleging that he could not fight in a cause which he disapproved. From this time he devoted himself to the favorite objects of annual parliaments and universal suffrage. He was the author of a Declaration of Rights, distributed by the Society for Constitutional Information. The French revolution was warmly welcomed by Cartwright. In the trials of Tooke, Hardy, Thelwall, and other reformers, Cartwright was present as a witness, and displayed much firmness and fearlessness. By his writings, public addresses, etc., he continued to promote the work of reform and constitutional liberty; and as late as 1820 was tried for conspiracy and sedition, for advising the inhabitants of Birmingham, which had then no parliamentary representative, to send what he called their "legislatorial attorney" to the house; but he escaped with a fine of £100. Major Cartwright was not a political reformer only. The plan of making the slave-trade piracy is said to have been first developed in his 'Letters on the Slave-Trade.' A statue has been erected in London to his memory.

Cartwright, Peter, American Methodist clergyman: b. Virginia, 1 Sept. 1785; d. near Pleasant Plains, Ill., 25 Sept. 1872. He was ordained in Kentucky in 1806, and in 1823 removed to Illinois, where he labored for nearly half a century. He also sat in the State legislature there, and in 1846 was defeated by Abraham Lincoln in an election for congressman. Admired for his eloquence and strong common sense, he was also loved for his quaint eccentricity of manner, and possessed great influence in his own denomination.

Cartwright, Sir **Richard John,** Canadian statesman: b. Kingston, Ont., 4 Dec. 1835. He was educated at Trinity College, Dublin, and entered Canadian politics as a Conservative, but on account of a disagreement with Sir John A. Macdonald joined the Liberal party. He has served in the Canadian Parliament almost continually since 1863. He was minister of finance from 1873 until 1878, when his opposition to the policy of protection caused his downfall. He is an able speaker and an authority on finance. In 1897 he was a member of a Canadian commercial commission to the United States. He was knighted in 1879.

Cartwright, Thomas, English Puritan divine: b. Hertfordshire, 1535; d. Warwick, 27 Dec. 1603. He suffered imprisonment and exile more than once for his nonconformist opinions. He was a learned man, and at one time professor of divinity at Cambridge. His chief books are: 'A Second Admonition to the Parliament' (the first one having been published in 1572); 'A Confutation of the Rhemist's Translation'; 'Harmonia Evangelica'; and a criticism of Hooker's 'Ecclesiastical Polity.'

Carucate, kăr'ū kāt, in mediæval times, as much land as one team could plow in the year. The size varied according to the nature of the soil and practice of husbandry in different districts.

Carupano, kä-roo'pä-nō, Venezuela, a seaport of the State of Bermudez, on the north coast of the peninsula of Paria, with a lighthouse and good roadstead. The surrounding district is fertile, and has mines of copper, sulphur, silver, lead, and lignite. The city exports cocoa, coffee, fish, etc., and has various manufactures. Pop. about 10,000.

Carus, kä-rūs, **Julius Victor,** German zoologist: b. Leipsic, 25 Aug. 1823. After studying at Leipsic, Würzburg, and Freiburg, he became at the age of 26 keeper of the Oxford museum of comparative anatomy. In 1853, two years after his return to his native city, he was appointed professor of comparative anatomy and director of the Zoological Institute there. Among his numerous writings are: 'System der Tierischen Morphologie' (1853); 'Handbuch der Zoologie'; and 'Geschichte der Zoologie.' He has translated most of Darwin's works into German.

Carus, Karl Gustav, goo'stăf, German physician and physiologist: b. Leipsic, 3 Jan. 1789; d. Dresden, 28 July 1869. He became professor of midwifery at the Medical Academy, and then royal physician, being subsequently a privy-councilor. He published a great number of writings covering a wide field of science, including medicine, physiology, anatomy, psychology, physics, painting, besides memoirs of his life. Among these are 'System der Physiologie' (1838–40); 'Lebenserinnerungen und Denkwürdigkeiten' (1865–6); 'Lehrbuch der Zootomie' (1818); 'Über den Blutkreislauf der Insekten' (1827); 'Psyche' (1851).

Carus, kăr'ŭs, **Marcus Aurelius,** Roman emperor: b. Nerona, Dalmatia, about 222 A.D.; d. near Ctesiphon, Mesopotamia, 283. His father was an African, and his mother a noble Roman lady. He was proclaimed emperor by the legions, on the assassination of Probus, 282. He caused justice to be executed upon the assassins. He gained a signal victory over the Sarmatians, and prosecuted the war against the Persians. Undertaking the campaign in midwinter, and making a rapid march through Thrace and Asia Minor, he ravaged Mesopotamia, made himself master of Seleucia, and carried his arms beyond the Tigris.

Carus, Paul, American philosophical writer: b. Ilsenburg, Germany, 18 July 1852. He was educated in the universities of Strassburg and Tübingen, and has been a resident of Chicago for several years, where he is editor of 'The Open Court' and 'The Monist.' He has published: 'The Ethical Problem'; 'Fundamental Problems'; 'The Soul of Man'; 'Primer of Philosophy'; 'Truth in Fiction'; 'Monism and Meliorism'; 'The Religion of Science'; 'The Philosophy of the Tool'; 'Our Need of Philosophy'; 'Science: a Religious Revelation'; 'The Gospel of Buddha'; 'Kanna'; 'Nirvana'; 'Homilies of Science'; 'Chinese Philosophy'; 'The Idea of a God'; 'Buddhism and Its Christian Critics'; 'The Dawn of a New Era'; 'Kant and Spencer'; 'The Nature of the State'; 'The History of the Devil'; 'Whence and Whither'; 'Eros and Psyche.'

Carus-Wilson, Charles Ashley, Canadian scientist: b. Eastry, England. He was graduated at Cambridge (1887) and became a civil engineer. Since 1890 he has been professor of engineering science at McGill University. He has written 'Electro-Dynamics,' and many monographs on his science.

Carutti di Cantogno, Domenico, dō-mā'nē-kō kä-rŭt'tē dē kän-tōn'yō, Baron, Italian historian and publicist: b. Cumiana, near Turin, 26 Nov. 1821. As a young man he took to romance writing, but was speedily absorbed in politics and rose to great distinction. When he resumed the pen, it was to compile such solid works as 'History of the Reign of Victor Amadeus II.' (1856) and 'History of the Reign of Charles Emanuel III.' (1859), which are interesting and scholarly.

Carvajal, kär-vä-häl', **Gas'par de,** Spanish missionary: b. Spain, early in the 16th century; d. Lima, Peru, 1584. He entered the Dominican order and went to Peru in 1533. In 1538 he accompanied the expedition of Gonzalo Pizarro to the countries east of the Quito as chaplain. He was appointed sub-prior of the convent of San Rosario at Lima; after the pacification of Peru he was sent to the mission of Tucuman and after working among the Indians there was made vicar-national of the province of Tucuman. With the aid of the Dominicans, whom he brought into the country, he established several Indian towns and Spanish colonies.

Carvajal, Tomas José Gonzales, tō'mä hō'sā gōn thä'lēs, Spanish statesman and author: b. Seville, 21 Dec. 1753; d. 9 Nov. 1834. He was appointed in 1795 governor of the new colonies in Sierra Morena and Andalusia, and protested against the French invasion of Spain in 1808. From 1809 to 1811 he served as commissary in the Spanish army against Bonaparte; in 1813 became minister of finance; relinquished these offices to assume the directorship of the royal university of Isidro, where he became involved in difficulties by establishing a professorship of constitutional law. He was arrested and detained in prison from 1815 to 1820, when the revolution reinstated him at San Isidro. A counter revolution brought his opponents into power, and he was exiled from 1823 to 1827. However, at the time of his death he was member of the supreme council of war, of the military department of the Spanish and Indian boards, and a grandee of Spain. He learned Hebrew at the age of 57 in order to translate the Psalms. This translation has gained for him a high reputation for poetical power.

Carvalho, José da Silva, hō'sā dā sēl vä kär-väl'yō, Portuguese statesman: b. Beira 1782; d. 3 Feb. 1845. He was a member of the regency and appointed minister of justice until 1823, when, on the downfall of the constitutional government, of which he was a foremost champion, he was obliged to resort to flight to England, where he remained until 1826, when he returned to Lisbon, but Don Miguel's success again compelled him to leave. Eventually he was named a member of the council of guardianship instituted by Don Pedro for the young queen, Donna Maria, and succeeded in negotiating the first English loan for Portugal. Having accompanied Don Pedro to the Azores, he filled, on his return to Portugal, important offices, and became finance minister in 1832. In 1835 he retired with the Palmella administration, and was presently obliged to retire to England, where he remained until 1838, when a general amnesty was proclaimed.

Carvalho, Paez de Andrade, Manuel de, pä-ĕth' dā än-drä'dā mä'noo-ĕl dā kär-väl'yō Brazilian politician: b. about 1795; d. Rio de Janeiro, 18 June 1855. Elected temporary president of Pernambuco in December 1823, he led a revolt the next year against Pedro I., the emperor, and on 2 July 1824, announced a republic entitled 'Confederacao do Equador.' On the suppression of the revolt in October, Carvalho fled to England, but subsequently returned to Brazil and was a senator from 1835.

Carvel-built, a term applied to a ship or boat, the planks of which are all flush and not overlapping, as in clinker-built boats.

Car'ver, John, first governor of the Plymouth colony: b. England, about 1575; d. Plymouth, Mass, April 1621. He joined the Leyden colony of English exiles about 1608, and as their agent assisted in securing a charter from the Virginia Company and in selecting and equipping the Mayflower. He was elected governor, probably 11 Nov. 1620, after the Mayflower reached Provincetown, showed great ability and judgment in governing the infant colony after the landing at Plymouth, and established by a treaty with the Indians peaceful relations that remained for many years undisturbed. He was re-elected in March 1621, but died a few days afterward. His chair and sword are still preserved as Pilgrim relics.

Carver, Jonathan, American traveler: b. Stillwater, N. Y. (the universal ascription to Connecticut is an error), 1732; d. London, 1780. He embraced a military career, and in the French war of 1756 commanded a company of provincials, in the expedition across the lakes against Canada. When peace was concluded in 1763, Carver undertook to explore the vast territory which Great Britain had gained. His object was to acquire a knowledge of the manners, customs, languages, soil, and natural productions of the nations and region beyond the Mississippi, and to ascertain the breadth of the continent by penetrating to the Pacific over its widest part, between lat. 43° and 46° N. He accordingly set out from Boston in 1766, and having reached Michilimackinac, the remotest English post, applied to Mr. Rogers, the governor, for an assortment of goods as presents for the Indians dwelling in the parts through which his course was to be directed. Receiving a portion of the supply which he desired, and a promise that the residue should be sent to him at the Falls of St. Anthony, he continued his journey. But not obtaining the goods at the appointed place, in consequence of their having been disposed of elsewhere by those to whom the governor had intrusted them, he found it necessary to return to La Prairie du Chien. He then, in the beginning of the year 1767, directed his steps northward, with a view of finding a communication from the heads of the Mississippi into Lake Superior, in order to meet, at the grand portage on the northwest side of that lake, the traders that usually came about this season from Michilimackinac, from whom he intended to purchase goods, and then to pursue his journey. He reached Lake Superior in good time; but unfortunately the traders whom he met there could not furnish him with any goods, as they had barely enough for their own purposes, and, in consequence, he was obliged to return to the place whence he first departed, which he did in October 1768, after remaining some months on the north and east borders of Lake Superior, and exploring the bays and rivers that empty themselves into that body of water. He soon after repaired to England with the view of publishing his journal and charts, and of obtaining reimbursement for the expenses which he had incurred. Having undergone a long examination before the lords commissioners of trade and plantations, he received permission to publish his papers; but when they were nearly ready for the press an order was issued from the council-board, requiring him to deliver immediately into the plantation office all his charts and journals. He was, consequently, obliged to repurchase them at a great expense from the bookseller to whom he had disposed of them — a loss for which he received no indemnification, but was forced to be satisfied with that obtained for his other expenses. He had fortunately kept copies of his papers, and he published them 10 years afterward in Boston, while in the situation of a clerk of a lottery. He died in want of the common necessaries of life in 1780, aged 48 years. His works are: 'Travels Through the Interior Parts of North America' (1778); 'Treatise on the Culture of the Tobacco Plant' (1779).

Carving, as a branch of sculpture, the art of cutting a hard material by means of a sharp instrument: but there are extended uses of the term, as shown below.

The term is generally employed for work which is strictly decorative as distinguished from grand sculpture; thus the wrought stone leafage, scroll work and even animal forms in a Gothic porch are *carving* in common parlance, and so are the human figures of the porch if they are conventional or stiff, as often happens in mediæval work. In a Roman temple or a neo-classic edifice the leafage of Corinthian capitals or of any panel or string-course would be called *carving,* while the statues and even the reliefs of human subjects would be spoken of as sculpture (q.v.). Small pieces, even of human subjects, such as decorative statuettes and groups, are spoken of as carving, and these may be wrought in wood, ivory, bone, marble, and other stones, and even in hard and semi-precious stones, such as agate and jade. The carvings of the Chinese and Japanese are especially in demand in western lands, because of their picturesque beauty. When they are of wood they are often painted, gilded or lacquered with a rich polychromatic effect.

Throughout the middle ages of Europe, ivory statuettes, backs of mirrors, and purely ornamental objects were treated in the same way, the carving being helped out by color and gold with extraordinary results.

Carving, when done in very hard material, such as rock crystal and jade, requires much use of the drill, in which case the meaning of the term must be extended to include the result produced by a rapidly revolving pin with emery powder or the like. One of the most ingenious and useful purposes to which carving has been converted in more modern times is that of engraving wood-cuts or blocks for printing. (See WOOD-ENGRAVING.) Carving has been applied to almost innumerable uses in manufactures as well as in art. Some of these applications have given way to the art of engraving in metal and other processes, but new ones are continually arising. The first carving-machine was invented about 1800, and many others have since been patented.

Cary, Alice, American poet: b. near Cincinnati, Ohio, 26 April 1820; d. New York, 12 Feb. 1871. When quite young she began writing sketches and poems for the press, and in 1852 she, with her sister, Phœbe (q.v.), removed to New York, where they lived during the rest of their lives. In 1850 the sisters published a volume entitled 'Poems by Alice and Phœbe Cary.' Alice soon after published 'Clovernook, or Recollections of Our Neighborhood in the West' (1851–3); 'Lyra, and Other Poems' (1853); 'Hagar, a Story of To-day' (1852); 'Married, not Mated,' a novel (1856); 'Lyrics and Hymns'; 'The Bishop's Son'; 'The Lover's Diary' (1867); and 'Snow Berries: A Book for Young Folks' (1869). The verse of the Cary sisters still retains a hold upon the affections of readers and not a few lines of theirs have become familiarized by frequent quotation. While living in New York they attracted about them a circle of literary people, and for 15 years their Sunday evening receptions were a feature in the literary life of the city.

Cary, Annie Louise, American singer: b. Wayne, Maine, 22 Oct. 1842. She studied in Milan, made her operatic début in Copenhagen in 1868, had a successful European career for three years, and returned in 1870 to the United States, where she won great popularity and remained, with the exception of one brilliant European tour, until 1882, when she married Charles M. Raymond, and retired from the stage while her voice was still unimpaired. Since then she has sung only in private or for charity.

Cary, Archibald, American statesman: b. Virginia, about 1730; d. Chesterfield, Va., September 1786. He early became a member of the House of Burgesses, and in 1764 served on the committee which reported the address to the king, lords, and commons, on the principles of taxation; and in 1770 was one of the signers of the "Mercantile Association," which pledged its members to use no British fabrics thereafter, the design being to resist by practical measures the encroachments of the government. In 1773 he was one of the celebrated committee of correspondence by which the colonies were united into one great league against Parliament. When the State government was organized he was returned to the Senate, where he presided with great dignity and efficiency. At this time occurred the incident with which his name is most generally connected. The scheme of a dictatorship had been broached, and without his knowledge or consent Patrick Henry was spoken of for the post. In the midst of the general agitation Cary met Henry's half-brother in the lobby of the assembly, and said to him: "Sir, I am told that your brother wishes to be dictator. Tell him from me, that the day of his appointment shall be the day of his death, for he shall find my dagger in his heart before the sunset of that day." The project was speedily abandoned. He was a good representative of the former race of Virginia planters, delighting in agricultural pursuits, in blooded horses, and improved breeds of cattle, which he imported from England, and attended to with great care.

Cary, Edward, American journalist: b. Albany, N. Y., 5 June 1840. He has long been connected with the editorial staff of the New York *Times.* His principal published work is a 'Life of George William Curtis' (1894).

Ca'ry, Elisabeth Luther, American writer: b. Brooklyn, N. Y., 1867. She is a daughter of Edward Cary (q.v.), and has published translations from the French of 'Sarcey and Melchior Vogue.' Her own works include 'Alfred Tennyson: His Homes, His Friends, and His Work' (1898); 'Robert Browning; Poet and Man' (1899); 'The Rossettis: Dante, Gabriel, and Christina' (1900).

Cary, George Lowell, American Unitarian theologian: b. Medway, Mass., 10 May 1830. He was graduated at Harvard College in 1852; and was a professor at Antioch College, 1856–62. Since 1862 he has been professor of New Testament literature in Meadville Theological Seminary, Pennsylvania, of which he is also president. He has published 'Introduction to the Greek of the New Testament' (1878); 'The Synoptic Gospels' (1900).

Cary, Henry Francis, English translator of Dante: b. Gibraltar, Spain, 6 Dec. 1772; d. London, 14 Aug. 1844. In 1790 he entered Christ Church, Oxford, and he took orders in

1796. In 1796 he was presented to the vicarage of Abbot's Bromley, Staffordshire, and in 1800 he removed to Kingsbury, in Warwickshire, another living to which he had been presented. His studies while at college had embraced a wide range of Italian, French, and English literature, and in 1805 he gave proof of his Italian scholarship, as well as of his poetic powers, by the publication of the 'Inferno' of Dante in English blank-verse, accompanied by the Italian text. The entire translation of the 'Divina Commedia' was accomplished in 1812, and the work was now published complete, but it lay unnoticed for several years, till Samuel Taylor Coleridge drew attention to its merits. It has since been recognized as a standard English work. Cary subsequently translated the 'Birds' of Aristophanes (1824), and the 'Odes' of Pindar, and wrote a continuation of Johnson's 'Lives of the English Poets,' and a series of 'Lives of Early French Poets.' He was for some time curate of the Savoy, London, and in 1826 was appointed assistant-keeper of printed books in the British Museum, which office he resigned in consequence of his being passed by on the appointment of Mr. Panizzi in 1837 to the office of keeper of the printed books. The government in 1841 granted him a pension of £200 a year as a recognition of his literary abilities, and he devoted himself henceforth to the annotation of a new edition of his translation of Dante, and to editing editions of the English poets Pope, Cowper, Milton, Young, etc. He was buried in Westminster Abbey.

Cary, Lott, American negro slave: b. Virginia, 1780; d. 1828. He educated himself, became a Baptist minister, purchased the freedom of himself and his two children for $850, and joined the colony sent in 1822 to Liberia, where he performed inestimable services in behalf of the new republic. He was acting as agent with full power when he was accidentally killed while making cartridges for defense against the slave traders.

Cary, Lucius. See FALKLAND.

Cary, Phœbe, American poet and prose-writer, sister of Alice Cary (q.v.): b. Cincinnati, Ohio, 4 Sept. 1824; d. Newport, R. I., 31 July 1871. She contributed numerous sketches to various periodicals; and with her sister published several books, among which are 'Poems and Parodies' (1854); and 'Poems of Faith, Hope, and Love.' She will be longest remembered as the author of the popular hymn beginning, 'One Sweetly Solemn Thought.'

Cary, Samuel Fenton, American politician: b. Cincinnati, Ohio, 18 Feb. 1814. He represented Ohio in Congress in 1867–9; was the only Republican representative to vote against the impeachment of President Johnson; and was an unsuccessful candidate for Vice-President in 1876, on the Independent, or so-called "Greenback" ticket headed by Peter Cooper.

Cary Rebellion, in North Carolina, an outcome of the religious and political disturbances set going by the constitution of Locke and Shaftesbury, whose laws and discriminations survived itself. (See CAROLINA, ORIGINAL CONSTITUTION OF.) One of these, requiring an oath to support the constitution and laws, debarred the Quakers (who were among the most influential of the early settlers, and by no means inclined to submit peaceably to oppression) from voting or holding office, or being witnesses in criminal suits. The establishment of and taxation for the Church of England was a common grievance to all the colony, nearly all its population being dissenters; and there were other obnoxious ordinances. At this time Albemarle County (North Carolina) had its separate deputy-governor, appointed by the governor of the entire colony; and in 1704 Sir Nathaniel Johnson so appointed Robert Daniel, a churchman, and "landgrave" or hereditary noble and councilor. He tried to enforce the laws; and one John Porter, an influential Quaker, shortly went to England to complain of him and of vexatious legislation against his sect. One of the proprietors, John Archdale (q.v.), ex-governor, was himself a Quaker, and induced the other proprietors to remove Daniel; and Johnson appointed Thomas Cary, a Carolina merchant, said to have been Archdale's son-in-law, in his place. Cary, however, felt bound to enforce the laws, and again the Quakers complained. Cary was removed (the accepted account says he was in ill odor with the proprietors for having been short in his accounts as collector of revenue for them); and this time the appointment of a deputy for Albermarle was taken from the governor, and a new proprietary council formed, with Porter and several other Quakers on it. On Porter's return to America in 1707, he convened the council, which elected William Glover, a churchman, president. Glover insisted on enforcement of the laws as before, and Porter's party turned against him, declared his election illegal, struck a bargain with Cary, and elected him president in Glover's place. Glover and his section refused to recognize the validity of the new election, and held their meetings in one room of the executive mansion, while Cary and his councilors met in the other. Daniel, as a landgrave, was *ipso facto* a councilor, and sat alternately in both. Each party issued writs for election to the Assembly, and it seems to have been held without formal recognition of either; but Cary's party held the majority. In 1710 Edward Hyde, a relative of Clarendon's, was appointed deputy-governor by the proprietors, and came out in August 1710 to assume office. His commission was to be taken from Tynte, who had succeeded Johnson; but Tynte had died, and Hyde had only his letters from the proprietors to show. The Cary party, however, was glad to acknowledge him so long as it held the power and he confirmed it; but the next Assembly was held by its enemies, Hyde apparently aided it in enforcing the laws in favor of the Church, and Cary's party promptly refused to acknowledge his authority and made open war on him. Cary attacked Edenton with two armed vessels, but was repulsed, and Hyde called on Gov. Spotswood of Virginia for help. Spotswood admitted that the revolters were "dangerous incendiaries," but said the country was almost inaccessible, and he had only militia; but finally sent some of his marines from the guard-ships at Hampton Roads. Cary, with his chief men, Levy, Truitt, etc., thereupon went to Virginia, apparently for temporary refuge, declaring that they would go to England and appeal to the proprietors. Spotswood took them at their word, and sent them, seemingly against their will, to England; and they disappear from history. That they

were discharged, however, is apparent from a circular letter of Lord Dartmouth to the colonies, at this juncture, to send no more prisoners to England for trial without proof of their guilt. At home, the burgesses refused to provide for the defense of the colony unless they could have share in the government and what they held to be their rights; and the result was a fearful desolation in a war which soon broke out with the Tuscaroras.

Ca'rya, a genus of American plants belonging to the order *Juglandaceæ. C. alba* is the common hickory. The seeds of *C. amara,* with oil of chamomile, are useful in colic. See HICKORY.

Caryatides, or **Caryatids,** kăr-ĭ-ăt'ĭ-dēz, in architecture, a name used to designate female figures made to support a roof, cornice, etc., instead of columns. The goddess Artemis (Diana), who had a temple in Caryæ, a Peloponnesian city, was for this reason called *Karyatis.* In honor of her, virgins danced in a festive procession during an annual feast, which suggested to architects the idea of adopting the images of virgins to serve as columns. Thus Lessing and others explain the name and form of the caryatides. Another explanation of their origin is the following: The inhabitants of Caryæ allied themselves with the Persians in their war with the Greeks. The Greeks, on the successful termination of that struggle, exterminated the males of Caryæ, and reduced all the women to slavery. As a mark of infamy, and to perpetuate the memory of the transaction, the architects of the time made statues representing these women in the servile office of supporting entablatures. Both explanations are somewhat doubtful.

Caryocar, kă-rī'ō-kăr, a genus of plants belonging to the natural order *Ternstrœmiaceæ,* consisting of lofty trees, natives of tropical America, which produce good timber. They have evergreen, ternate or pinnate leaves, and flowers in racemes. *C. nuciferum,* a species abundant in British Guiana, yields the kidney-shaped souari-nuts, or butternuts. Other species are *C. glabrum* and *C. amygdaliferum.*

Caryophyllaceæ, kăr-ĭ-ō-fĭ-lā'sẹ-ē, an order of plants, of which the pink, named by botanists in early times *Caryophyllus,* and more recently *Dianthus,* may be considered as the type. The plants of this order are readily distinguished by their opposite undivided leaves, without stipules, the tumid articulations of the stems, and the disposal of the seeds upon a free central placenta, surrounded by several carpellary leaves. Several species are cultivated by florists; a few are used in medicine, and the *Saponaria officinalis* and *Lychnis diurna* yield a mucilage resembling soap. The Clove-pink (*Dianthus caryophyllus*) is the origin of all the cultivated varieties of carnations, picotees, bizarres, flakes, etc. There are about 60 genera and 1,100 species.

Caryop'sis, the small peculiar, one-seeded, dry indehiscent fruit of the grasses, as wheat, barley, etc.

Caryo'ta, a genus of palms, with doubly pinnate leaves, the best-known species of which (*C. urens*) is a native of most of tropical Asia; it supplies an inferior kind of sago, and from its juice is made toddy or palm-wine. The leaf-stalks yield kittul fibre, which is used in making baskets, brooms, etc.

Ca'rysfort Reef, a coral reef near the southern extremity of Florida, on which is erected a lighthouse of the first order, 112 feet high.

Casa, Giovanni della, jō-vän'nē dĕl'lạ kä'-zä, Italian writer: b. Mugello, near Florence, 1503; d. Rome, 14 Nov. 1566. He studied in Bologna, Florence, and Rome, and entered as an ecclesiastic into the service of the two cardinals Alessandro Farnese, the first of whom, in 1534, ascended the papal chair, under the name of Paul III. He rose through various offices in the Church, including the archbishopric of Benevento, till Paul IV. made him his private secretary. His most celebrated work is 'Galateo, ovvero de' Costumi' (1560), a manual of good-breeding, to which another book, 'Degli Uffizj communi tra gli Amici Superiori e Inferiori,' forms a supplement. This last is a translation of his Latin treatise, 'De Officiis Inter Potentiores et Tenuiores Amicos.' The best and most complete edition of his works appeared at Venice (1752).

Casa Braccio, bräch'ō, Italian romance, by Francis Marion Crawford, published 1896. The first half of the novel is much the better.

Casa Grande, kä'zạ grän'dā, the ruins of a prehistoric building in Arizona, near the Gila River, within 20 miles of the Casa Grande station. Built of adobe with walls, in some places five feet thick at the base, narrowing toward the top, it is the best-preserved structure of a type which was probably widely distributed. The space enclosed by the walls now standing measures about 43 by 59 feet; and the walls, which are high, show that there were three, and perhaps four, stories. There are three central rooms and two end rooms. A large area surrounding this building is covered with mounds and débris of other buildings, indicating that there was originally a considerable settlement on the site. It was built by a Pueblo or allied race, and the evidence is in favor of the theory that they were the ancestors of the Pima Indians who now inhabit the region. In 1889 Congress made an appropriation for the preservation and repair of the Casa Grande, and the whole area has been made government property. During the removal of the débris a number of specimens of pottery and stone implements have been found. The ruins were seen by Coronado's expedition and mentioned by Catañeda; they were carefully described by Father Menge, who, with Father Pinto, visited them in 1694 and 1697. John R. Bartlett was the first to give a detailed description of them in modern times in his 'Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora, and Chihuahua' (1849). The best and most recent accounts are found in the publications of the Bureau of American Ethnology (13th and 15th annual reports).

Casabianca, Louis, loo ē kä-zä-bē-än-kä, French naval officer: b. Bastia, Corsica, about 1755; d. 1 Aug. 1798. He sat in the National Convention of 1792; and in 1798 was captain of the flagship L'Orient in the expedition to Egypt. He was mortally wounded at the battle of the Nile, 1 Aug. 1798; the ship caught fire; his 10-year-old son would not leave him, and both were killed by the exploding of the ship. The story

of their death is the subject of Mrs. Hemans' well-known poem.

Casal, or **Cazal, Manuel Ayres de,** mä'nooĕl ī'rĕz dā kä-säl', Portuguese geographer: b. in the last half of the 18th century; d. Lisbon about 1850. Having received an excellent education, he took holy orders, but afterward devoted himself to the exploration of Brazil. He has been styled the father of Brazilian geography, and his principal work, entitled 'Corografia Brasilica' (1817), elicited the admiration of Humboldt and of other competent judges.

Casale, or **Casale de Monferrato,** kä sä lā mŏn-fĕr-rä'tō, Italy, a city in the province of Alessandria, on the right bank of the Po, 18 miles north-northwest of Alessandria. The citadel, founded by Duke Vicenzo in 1590, was one of the strongest in Italy, but its ramparts have been converted into promenades, and its defenses are now insignificant. In 1640 the Spaniards were defeated here by the Duc d'Harcourt, and the possession of the town was repeatedly contested by the Austrians and French during the wars of Napoleon. Casale was the capital of the ancient Montferrat. It is the seat of a bishop and of a district court of justice, and has a cathedral which is said to have been founded in the 8th century. Its church of San Domenico, containing a tomb in memory of the Princess Palæologi, is remarkable for the elegance of its design, and several fine works of art are found in other of its churches. Among the prominent articles of trade are silk, and sirup manufactured from the roots of a species of reed. Pop. about 32,000.

Casale Pusterlengo, kä-sä'lā pûs-tĕr-lĕn'gō, Italy, a town in the province of Milan, southeast of Lodi, beautifully situated in a fine plain between the Po and the Adda. It has a trade in Parmesan cheese. In 1796 the Austrians were attacked here by the French, and driven back to Lodi. Pop. 6,304.

Casalmaggiore, kä-säl-mäd-jō rē, Italy, a town in the province of Cremona, and 22 miles southeast of the city of Cremona (with which there is railway connection), on the left bank of the Po. There are a cathedral and other churches, theatre, etc. The manufactures include pottery and glass-ware; and there is a trade in wine, grain, hemp, and cheese. In 1448 the Venetians were defeated here by Francesco Sforza. Pop. 15,648.

Casamicciola, kä-sä-mē'chō-lä, Italy, a favorite watering-place on the island of Ischia, beautifully situated in a valley on the north side of Monte Epomeo, with hot springs (158° F.), baths, hotels, etc. The season extends from June to September. By the earthquake of 28 July 1883, the place was almost entirely destroyed.

Casanare, kä-zä-nä'rę, a river of the Republic of Colombia, which flows through a region called by the same name, and after an easterly course of 180 miles empties into the Meta.

Casanova, Francesco, frän-chĕs'kō kä-sänō'vä, Italian painter: b. London 1730; d. Brühl, near Vienna, 1805. He went to Venice with his parents, was in Paris in 1751, but after a brief stay went to Dresden, where he remained from 1752 to 1756. Here he studied and copied the paintings of Wouverman. He acquired renown as a painter of battle pieces, and was admitted to the Academy of Fine Arts in 1763. Catherine II. of Russia employed him to paint her victories over the Turks. He settled in Vienna in 1785, and the gallery there contains several of his paintings.

Casanova de Seingalt, Giovanni Jacopo, jō-vän'nē yä'kō pō kä-sä-nō'vä dĕ săn-gäl, Italian adventurer: b. Venice 1825; d. Düx, Bohemia, 4 June 1798. He was the son of an actor and actress; he studied law at Padua, but gave this up to study for the priesthood. He was expelled from the Seminary of St. Cypsian for a scandalous intrigue, and was also imprisoned for a short time. The influence of his mother procured him a place in the establishment of Cardinal Aquaviva, but he did not retain it long; and after visiting Rome, Naples, Corfu, and Constantinople, in the characters of diplomatist, preacher, abbot, lawyer, and charlatan, he was imprisoned at Venice in 1755, but escaped owing to his wonderful keenness and skill. In his travels throughout Europe he formed associations with many distinguished characters, Louis XV., Rousseau, Voltaire, Suvaroff, Frederick the Great, and Catherine II. His most celebrated work is his 'Memoirs' (1828–38), in which he relates with a cynical freedom the whole of his extraordinary adventures, and presents a picture of society without conventional disguise. Among his dupes were Mme. de Pompadour, Frederick the Great, and even that other prince of charlatans, Cagliostro. Besides his 'Memoirs,' Casanova was the author of several works of history or imagination in French and Italian, which show the versatility of his genius. The most remarkable are 'Recit de sa Captivite' (1788), and a translation in verse of the Iliad.

Casas, Bartolomé de las, bär-tō'lō-mā dā läs kä'säs, Spanish prelate: b. Seville 1474; d. Madrid July 1566. In his 19th year he accompanied his father, who sailed with Columbus, to the West Indies. Five years afterward he returned to Spain, and pursuing his studies he entered the priesthood. He accompanied Columbus in his second voyage to Hispaniola (Haiti), and on the conquest of Cuba settled there, and distinguished himself by his humane conduct toward the oppressed natives. He set at liberty the Indians who had fallen to his share in the division; and so much was he interested for them, that in 1516 he went to Spain to lay a statement of their case before King Ferdinand, whose death at that time prevented any measures for their benefit. The regent, Cardinal Ximenes, however, appointed a commission to examine circumstances on the spot, and to determine accordingly. Las Casas was to accompany them, with the title of Protector of the Indians. The commissioners found that it was impossible to liberate the Indians, and therefore endeavored to secure their humane treatment; but Las Casas, still dissatisfied, remonstrated so warmly that he was obliged to take refuge in a convent from the rage of the planters. He again returned to Europe; and on the accession of Charles V., in consequence of his representations, the council appointed a chief judge to re-examine the points of controversy between the partisans of Indian liberty and the colonists. Las Casas, in his zeal for the Indians, became the author (or the encourager at least) of the slave-trade, by proposing to pur-

chase negroes from the Portuguese in Africa to supply the planters with laborers, of the want of whom they complained; and this was unfortunately put into execution. He next applied for a grant of an unoccupied tract, in order to try his own plan with a new colony. This he at length obtained, and with 200 persons, whom he persuaded to accompany him, landed at Porto Rico in 1521, but found that an expedition was advancing to ravage this very tract, and convey its inhabitants to Hispaniola as slaves. He endeavored in vain to prevent the threatened danger, and with the few who still adhered to him returned to Hispaniola to solicit succor. During his absence the natives attacked the colonists with such success that in a short time not a Spaniard remained in that part of South America. Las Casas, in despair at the failure of his project, retired to the Dominican convent at St. Domingo, and assumed the habit of the order. Notwithstanding his retirement his zeal in the cause of the Indians did not abate; and being sent on a mission to Spain by a chapter of his order at Chiapas in 1542, he pleaded their cause with his pristine warmth, and composed his famous treatise 'Brevisima Relacion de la Destruccion de las Indias,' in which he exposed the cruelties practised by the Spaniards. His unremitting perseverance at length obtained a new set of laws and regulations, by which the natives were greatly relieved. In 1544 he returned to America as bishop of Chiapas, but left it three years later, and resigned his bishopric in 1550. Besides the treatise above named he wrote 'Historia de las Indias.' This was first printed in 1875–6. It is one of the most notable of books, not only in its contents,— as a history of Spanish discoveries from 1492 to 1520, and a contemporary Spanish Catholic criticism as well as story of Columbus,— but in the circumstances which prevented its publication for more than 300 years, and which still leave it inaccessible except to readers of Spanish. See Llorente, 'Œuvres de las Casas' (1822); Quintana, 'Vidas de Espagñoles Celebres'; Helps, 'Life of Las Casas and Spanish Conquest' (1868); Fabie, 'Vida y Escritas de Las Casas' (1879); Sabin, 'Works of Las Casas' (1870).

Casas Grandes, kä'säs grän'däs (Span. "great houses"), a town in Chihuahua, Mexico, on the Casas Grandes or San Miguel River, 35 miles south of Llanos, and 125 miles southwest of El Paso, remarkable for a number of ruins, apparently relics of an aboriginal race. These ruins are found about half a mile from the small Mexican village, partly on the declivity of a small hill, and partly on the plain at its foot. They consist chiefly of the remains of a large edifice of the pueblo type, built entirely of a substance resembling adobe, mud mixed with gravel and straw and formed into blocks 22 inches thick and about three feet long. The portions which must have been constructed of wood have entirely crumbled away. The outer walls are almost all prostrate, except at the corners, and were probably only one story high; the inner walls are better preserved, varying in height from 5 to 50 feet, and being in some cases five feet thick at the base. The portions remaining erect seem to indicate an original height of from three to six stories. The doorways have the tapering form noticed in the ancient structures of Central America and Yucatan, and over them are circular openings in the partition walls. The stairways were probably of wood, and placed on the outside. Clavigero, in his 'History of Mexico,' tells us that the building, according to popular tradition, was erected by the Mexicans in their peregrination, and that it consisted "of three floors, with a terrace above them, and without any entrance to the lower floor. The door for entrance to the building is on the second floor, so that a scaling ladder is necessary." The main features of the edifice seem to have been three large structures connected by ranges of corridors or low apartments, and enclosing several courtyards of various dimensions. The extent from north to south must have been 800 feet, and from east to west about 250 feet. A range of narrow rooms lighted by circular openings near the top, and having pens or enclosures three or four feet high in one corner, supposed to be granaries, extends along one of the main walls. Many of the apartments are very large, and some of the enclosures are too vast ever to have been covered by a roof. About 200 feet west of the main building are three mounds of loose stones and 200 feet west of these are the remains of a building, one story high and 150 feet square, consisting of a number of apartments ranged around a square court. The inhabitants of this communal structure seem to have disappeared long before the Spaniards noticed the ruins in the latter part of the 17th century. Throughout the northern part of Mexico the name Casas Grandes is applied to deserted buildings of a similar type.

For some distance south the plain is covered with tracts of ancient buildings, and for 20 leagues along the Casas Grandes and Llanos rivers are found artificial mounds from which have been dug up stone axes, corn-grinders, and various articles of pottery, such as pipes, jars, pitchers, etc., of a texture far superior to that made by the Mexicans of the present day, and generally ornamented with angular figures of blue, red, brown, and black, on a red or white ground. The best specimens command a high price in Chihuahua and neighboring towns. On the summit of a mountain, about 10 miles from the ruins above described, are the remains of an ancient stone fortress, attributed to the same people who built the Casas Grandes, and probably intended as a lookout. See PUEBLOS.

Casati, Gaetano, gä-ä-tä'nō kä sä'tē, Italian explorer in Africa: b. Monza, Italy, 1830; d. Como 7 March 1902. He entered the army of Piedmont at 21, and resigning in 1879 went to Africa, commissioned by the Società d' Esploragione Commerciale d' Africa. He joined his countryman, Gessi Pasha, in the Bahr-el-Gazelle valley, but the schemes of the Mahdi in 1883 shut him up in the Niam-Niam region with Emin Pasha. At the request of the latter he consented to act as "President" in King Kabba Rega's country, but after being at first well treated by that monarch he was later condemned to death. Escaping with great difficulty to the Albert Nyanza Lake, and losing all his notes and manuscripts, he was finally rescued by Emin Pasha in 1888. The expedition of Stanley came a little later to the relief of both. On his return to Italy Casati published a volume descriptive of his adventures, entitled 'Dieci anni in Equatoria.'

Casaubon, Isaac, ē-zäk kä-zō-bôn, Swiss classical scholar: b. Geneva 18 Feb. 1559; d. London 12 July 1614. In his ninth year he spoke Latin fluently. In his 19th year he entered the university at Geneva, where he studied Greek, theology, the Oriental languages, etc., and in 1582 succeeded Portus as professor of the Greek language. In 1586 he married the daughter of the famous printer Henry Stephens. In 1596 he accepted a professorship of Greek and belles-lettres at Montpellier, but held it only two years. In 1600 Henry IV. invited him to Paris. His Protestantism, the jealousy of other scholars, and perhaps his rather unyielding character, were the occasion of many unpleasant occurrences, for which, however, he was indemnified by the office of royal librarian. After the death of Henry IV. in 1610 he went to England on the invitation of the Archbishop of Canterbury, where he was received with distinction, was presented with a prebend in Canterbury Cathedral, and had a pension conferred on him by James I., with whom he was a great favorite. He was buried in Westminster Abbey. Casaubon was a liberal theologian, a man of extensive learning, a good translator, and an excellent critic. As a critic, he commented on Diogenes, Laertius, Aristotle, Theophrastus, Suetonius, Persius, Polybius, Theocritus, Strabo, Dionysius of Halicarnassus, Athenæus, Pliny the Younger, etc. Nearly all the ancient classics are indebted to his valuable researches. His profound dissertation on the satirical poetry of the Greeks and the satire of the Romans ('De Satyrica Græcorum Poësi et Romanorum Satyra') deserves particular praise. His theological writings are of less value. His diary, which had been preserved by his son, Meric, was published in 1850 under the title of 'Ephemerides.' An admirable 'Life of Casaubon' has been written by Mark Pattison' (1875).

Casaubon, Meric, son of the preceding, Swiss classical scholar in England: b. Geneva 14 Aug. 1599; d. Oxford 14 July 1671. He went to school at Sedan, and in 1611 followed his father to England, and studied at Eton and Christ Church, Oxford. He held successively several livings in the Church, when the revolution, which brought Charles I. to the scaffold, deprived him of his income. Still he rejected the proposal of Cromwell to write the history of his time, as also the invitation of Queen Christina to live in Sweden. On the return of the Stuarts he was rewarded for his loyalty by restoration to his offices in the Church, which he held till his death. Besides various works in Latin, he wrote several in English on theological and other subjects. He also wrote some critical works on the classics, a treatise, 'De Verborum Usu' (1647); etc.

Casbin. See KASBIN.

Casca, Publius Servilius, Roman conspirator: d. 42 B.C. He assisted in the assassination of Julius Cæsar in 44 B.C., and according to Plutarch, he struck the first blow, in the back of the neck.

Cascade Range, a range of mountains in North America, parallel to and about 120 miles from the Pacific coast, extending from the Sierra Nevada in California northward through Oregon and Washington into British Columbia. The highest peaks are Mount Rainier in Washington, 14,526 feet, and Mount Shasta in California, 14,440 feet. The name is derived from the cascades formed by the Columbia River in breaking through the range.

Cascape'diac River, Great, a river of Canada, in the province of Quebec, flowing southeast into Chaleur Bay. Its length is 150 miles.

Cascapediac River, Little, a river of Canada, in the province of Quebec, east of the Great Cascapediac and with an almost parallel but shorter course.

Cascara Sagrada, the bark of a northwestern tree (*Rhamnus Purshiana,* or California buckthorn), of the natural order *Rhamnaceæ.* The composition of cascara is extremely complex, but its main action is due to the volatile oils, the anthracene resins, at least three, the amaroids, and the tannin. It stimulates peristalsis, increases the intestinal juices, and has marked effects on general excretion. It is an excellent laxative, and one of the very best cathartics for habitual and chronic constipation. It is best used in the form of a fluid extract. Because of its valuable properties, many patent drugs with similarly sounding names have been foisted on the public. These mostly contain other and more powerful and pernicious cathartics. See BUCKTHORN; RHAMNUS.

Cascarilla, the bark of a tree (*Croton eleuteria*), of the family *Euphorbiaceæ.* This is a shrub of the Bahamas and now yields most of the cascarilla of commerce, although in former years other species were used. It contains tannic acid, volatile oils, cascarillin, a glycoside, and some resin. In medicine it is used as an aromatic bitter in combination with other remedies for constipation, indigestion, and loss of appetite.

Cas'co Bay, a bay on the southwest coast of Maine. It is about 20 miles wide and so deep as to constitute one of the best harbors of the world, for all kinds of vessels. It contains many islands.

Case, Augustus Ludlow, American naval officer: b. Newburg, N. Y., 3 Feb. 1813; d. Washington, D. C., 17 Feb. 1893. He entered the navy as a midshipman in 1828. In the Mexican war he took part in the capture of Vera Cruz and Tobasco, and during the Civil War served as fleet-captain of the North Atlantic blockading squadron. He took part in the capture of Forts Hatteras and Clark, and cut out the blockade-runner Kate, under the fire of the forts at New Inlet, N. C. He was a lighthouse inspector in 1867; chief of bureau of ordnance, 1869; commander of the European squadron in 1873; and was retired in 1875.

Case, Leonard, American philanthropist: b. Cleveland 27 June 1820; d. 6 Jan. 1880. He graduated at Yale College in 1842, and continued to pursue literary and scientific studies, contributing to the best magazines. Inheriting from his father a large estate in the city of Cleveland, he deeded a certain part of it for the founding and maintenance of an educational institution, which was incorporated after his death as the Case School of Applied Science (q.v.).

Case, Thomas, English philosophical scholar. He was educated at Rugby, and Balliol College, Oxford, and has been Wsynflete professor of moral and metaphysical philosophy at

Oxford from 1889. He has published 'Materials for History of Athenian Democracy from Solon to Pericles' (1874); 'Realism in Morals' (1877); 'Physical Realism' (1888); 'St. Mary's Clusters' (1893).

Case, in grammar, a form, modification, or inflection of a noun or pronoun, indicating or corresponding to its relationship to some other word or words in a phrase or sentence, as, John (nominative case) speaks; John's (possessive) dog barks; John beats his dog (objective). In adjectives, case is merely sympathetic, the adjective agreeing in case with the noun which it qualifies. In English, nouns undergo only one inflection representing a different case from the nominative or general form of the noun; all other cases are represented either by prepositions or by the position of the noun in the sentence, the nominative case usually preceding the verb, the objective or accusative following it. The single inflected case in English is the possessive or genitive (John's). English pronouns have three cases — nominative, genitive, and accusative, as *he, his, him.* The last often serves as a dative. Adjectives undergo no modifications in English. In Sanskrit there are eight cases — nominative, accusative, instrumental, dative, genitive, ablative, locative, and vocative. In Latin there are six cases — nominative, genitive, dative, accusative, vocative, ablative. In Greek there are five, the ablative not being used. In both Latin and Greek there are traces of a locative case. In French, Italian, Spanish, and Portuguese, the nouns have no case-inflections. In German both nouns and adjectives are inflected for case. There are four cases in German — nominative, genitive, dative, accusative.

In law, the word has various meanings. An "action upon the case" is one in which damages are sued for, for some cause of complaint where the injury done is not direct, as in trespass, but consequential. A "case stated" is a statement prepared by one court for the decision of a point of law by a superior court. A "special case" is a written statement of facts agreed on by two or more litigants in an action, in order that a court may decide their legal effect.

In letter-press printing, a case is a receptacle for types, generally made of wood, 34 inches long, 15 inches wide, and 1¼ inches deep, and divided into compartments or "boxes," each of which contains types of one class or letter. A pair of cases consists of an upper and a lower case; the upper one has 98 boxes, and contains the capitals, small capitals, and some other signs that are only occasionally required in composition; the lower one has 54 boxes, and holds the letters of the small characters, figures, spaces, and most of the points. Thus the small characters are habitually spoken of by printers as "lower-case" letters, and the capitals, etc., as "upper-case" letters. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing-offices, but the differences are few. The different sizes of the boxes in the lower case depend upon the comparative frequency with which the several letters occur in the composition, and the position in the case allotted to each letter is such as to afford the greatest facility in composing. The letter *e,* which is most run upon in the English language, has a box much larger than any of the other compartments, and is placed directly in front of the compositor. In the upper case the boxes are of uniform size, and the letters are placed in nearly alphabetical order, the comparatively rare occurrence of capitals rendering it less important which letter is nearest the compositor's hand. Cases are mounted in a slanting position upon a frame of convenient height.

Cases are named from their use or construction, as "Italic case," a two-third case for holding Italic type; "two-third case," a single case in which two thirds of the space is equivalent to the ordinary lower case, and the remaining third is occupied by the capitals, etc.; "job case," a single case suited to holding a small job font of type; "rule case," a case for holding brass rule; "sort-case," a case for containing "sorts." The manufacture of cases has received a serious setback since the introduction of type-composing machines. See PRINTING.

Case-hardening, the process of converting the surface of certain kinds of malleable-iron goods into steel, thereby making them harder, less liable to rust, and capable of taking on a better polish. Fire-irons, gun-locks, keys, and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed, and heated to redness with powdered charcoal or cast-iron, the malleable iron taking carbon from either of these to form a skin of steel upon it; the heated objects are then cooled in cold water, or in oil when they are of a delicate nature. Yellow prussiate or potash or parings of leather have also been a good deal used for coating iron articles with steel by heating them together. Some chemists consider that in this case nitrogen combines with the iron and effects the hardening. The coating of steel is very thin, seldom exceeding one sixteenth of an inch. A Swedish ironmaster has found that a very excellent case-hardening is obtained by treating iron or steel objects with a mixture of animal matter, such as rasped leather or horn, and arsenious acid dissolved in hydrochloric acid, and heating as usual.

Case School of Applied Science, The, at Cleveland, Ohio, founded by Leonard Case (q.v.) of that city. In 1877 a deed of trust was executed setting apart certain real estate for the support of the institution, the deed to take effect upon his death, which occurred in 1880. The Case School was incorporated 29 March 1880. Instruction began in 1881, with a class of 16 students, the school being carried on from that time until the summer of 1885 in the old Case homestead. A commodious building having been erected for the use of the school, it was occupied at the beginning of the term in September 1885. A year later the building with all that it contained was destroyed by fire. It was promptly rebuilt and occupied in 1888. Since that time several additional buildings for laboratory and shop exercises have been erected, with superior apparatus and appliances, and museums are in the course of development. The Case School of Applied Science offers eight regular courses of instruction, each requiring four years. They are civil engineering, mechanical engineering, electrical engineering, mining engineering, physics, chemistry, architecture, and general science. There are 126 professors and

instructors and 353 students. The degree of bachelor of science is granted to all who complete one of the regular courses. That of master of science may be conferred upon graduates who have devoted at least one year exclusively to graduate study. Professional degrees, namely, civil engineer, mechanical engineer, electrical engineer, and engineer of mines may also be conferred after one year of graduate study or after professional work in positions of responsibility, for three years after graduation. The property left by Mr. Case as an endowment for the support of the school is valued at about $2,000,000, and the amount invested in buildings and equipment is about $350,000. The school derives its support in part also from tuition fees. Its government rests with a corporation consisting of 20 men, from whom six, known as trustees, are selected.

Case-shot, a projectile formed by putting a quantity of bullets into a cylindrical tin box called a "canister," that just fits the bore of the gun. In case of necessity, the canister is filled with broken pieces of iron, nails, stones, etc. The case is closed at both ends by a disk of wood or iron. Shot of this sort is thrown from cannons and howitzers, and is very injurious to the enemy, because the balls contained in the canister spread, diverging in proportion to the distance. The balls vary in weight, according to the character of the ordnance, from one or two pounds to half an ounce each. The range within which case-shot are used sometimes extends to 500, but seldom exceeds 200 to 300 yards. It is also called "canister-shot." The shrapnel-shell, in its present cylindrical shape, may be considered a variety of case-shot. See ORDNANCE.

Case-worm. See CADDIS-FLY.

Casein, kā'sē-ĭn (Lat. *caseus,* "cheese") a substance resembling albumen in its general properties, and obtained from milk. The older chemists gave the name "casein" both to the precipitated substance that is now known by that name, and to the corresponding substance as it exists in solution in the milk; but it is usual at the present time to distinguish the latter as "caseinogen." Caseinogen is the principal nitrogenous constituent of milk, and is precipitated as a curdy mass when acetic acid or a mineral acid is added to milk that has been previously diluted by the addition of its own bulk of water. If the caseinogen so prepared is made into a paste and then treated with a small quantity of rennet, the mass sets at once into a solid clot, consisting of true casein; but Hammarstein has shown that if the caseinogen is first washed entirely free from calcium phosphate, rennet is without action upon it. The precise function of the calcium phosphate is obscure, and the same may be said of the chemical relations of the proteids in general. If rennet is added to fresh milk a bulky deposit of casein comes down immediately; but to obtain the casein in pure form, the oily matters in the milk should be first removed by the action of a centrifugal separator, and the casein, after precipitation, should be compressed so as to expel as much of the whey as possible. Caseinogen is not precipitated by heat, nor does it (like fibrinogen) coagulate spontaneously. The coagulation observed when milk is boiled is due to the albumen present, and not to the casein; and that which occurs upon standing may be due either to the generation of lactic acid through the fermentation of the lactose present, or to the rennet-like action of the ptomaines liberated by micro-organisms that happen to fall into the milk from the air. According to the analyses of Chittenden and Painter, the elementary percentage composition of casein is as follows: Carbon, 53.30; hydrogen, 7.07; nitrogen, 15.91; sulphur, 0.82; phosphorus, 0.87; oxygen, 22.03. Casein is insoluble in water, but dissolves easily in alkaline solutions. It also dissolves in very weak hydrochloric acid, from which it is again precipitated upon the addition of the same reagent in more concentrated form. When freshly prepared it is soluble in a strong solution of borax, and in this form it is used as an adhesive under the name "casein glue." A compound of casein with lime is also used in the arts for "animalizing" cotton cloth, so that the fibres will retain colors that otherwise would not adhere to them. See PROTEID.

Casemates (Sp. *casa,* "a house," and *matare,* "to kill"), in fortification, vaults which are proof against bombs, and which may be constructed under a parapet and provided with embrasures or ports through which guns are fired. They may serve, at the same time, as a place for keeping the heavy ordnance and various stores, and in case of necessity as habitations for the garrison or shelter for sick or wounded.

Caserta, kä-zär'tä, Italy, the capital of the province of Caserta, 17 miles northeast of Naples. It is the seat of a bishop, and contains many fine buildings. The principal edifice is a palace, one of the finest in Europe, a large and richly decorated structure commenced in 1752 by Charles III. of Spain, and situated among gardens adorned with numerous ancient and modern statues. The principal manufactures are silk goods, carpets, linen, etc. The district produces excellent fruit and wine. About two and a half miles to the northeast is Caserta Vecchia (Old Caserta), the new town being distinguished as Caserta Nuova. Pop. 33,000.

Caserta (formerly TERRA DI LAVORO), a province of Italy, north of Naples, along the Mediterranean Sea. Its chief industries are agriculture and cattle raising; there are also some flourishing manufactures. Area, 2,033 square miles. Pop. 749,414.

Casey, Silas, American army officer: b. East Greenwich, R. I., 12 July 1807; d. Brooklyn 22 Jan. 1882. He was graduated from the United States Military Academy at West Point in 1826; served in the Mexican war, being present at the battles of Contreras, Churubusco, Molino del Rey, and the siege of Chapultepec. When the Civil War broke out he was given charge of organizing the volunteers near Washington; later served in the Army of the Potomac, and won much distinction at Fair Oaks; was president of the board to examine candidates for officers of colored troops in 1863–5; brevetted major-general, U. S. A., 13 March 1865; and retired in 1868. His publications include 'System of Infantry Tactics' (1862); and 'Infantry Tactics for Colored Troops.' (1863).

Casey, Thomas Lincoln, American military engineer: b. Sackett's Harbor, N. Y., 10 May 1831; d. Washington, D. C., 26 March 1896. He graduated from West Point in 1852, and entered the engineer corps of the army. During the Civil War he was superin-

tending engineer of defenses on the coast of Maine, and on special duty with the North Atlantic squadron in the first expedition against Fort Fisher. In 1865 he was brevetted colonel for gallant services during the war. In 1868 he was put in charge of one of the departments in the chief engineer's office at Washington; in 1873 was sent abroad for professional service; and in 1877 was placed in charge of the construction of the state, war, and navy building, and of the Washington aqueduct, and also of the Department of Public Buildings and Grounds. Later he built the White House conservatory and the Army Medical Museum, completed the Washington monument, and took charge of the construction of the Congressional Library. He was president of the board of engineers for fortifications at New York in 1886–8; was promoted chief of engineers and brigadier-general in 1888; and was elected to the National Academy of Sciences in 1890.

Cash Register, an automatic mechanism for registering money accounts. It is probably the most antique and, yet in its improved form, the most modern appliance known to commerce. The ancients, more than 6000 years ago, used a registering device, termed an Abacus, for the purpose of indicating visibly to the seller and buyer the amount purchased. The cash register is an absolute necessity. By infallible mechanism it provides not only a correct registration of all the cash received, but at the same time, with the aid of a miniature printing press, it records or prints the details of each and every transaction that occurs, upon a printed strip or tape, thus keeping the proprietor in constant touch with each and every detail of his business, and offering him at a glance, a thousand times a day, if necessary, without the slightest trouble or inconvenience, a diagram of the progress of each department in his store, as well as the industry of each clerk. The push of the industrious one can be noted and appreciated. It furnishes a chart that enables the business man to direct and control his affairs as the pilot controls the movements of his vessel by the compass before him. The miniature printing press attached to the modern cash register also cuts off and issues a printed check or bill, which is handed by the clerk to the customer for payment to the cashier, thus saving a great amount of time and unnecessary labor in writing. The use of the modern cash register is indispensable to the business man, because it furnishes him with a labor-saving device of unerring accuracy for the most sensitive and vital part of his business, "his cash and credit." The prime object of a cash register is to protect and secure a correct accounting of all the cash received or paid out, and where a credit business is done, to so systematize the accounts as to insure a correct record of the same. The good qualities of the modern cash register consist in boldly proclaiming or indicating each and every transaction, and correctly recording or transmitting the indication to the adding and printing mechanism, so that the customer, clerks and proprietor may depend upon a correct accounting of each and every detail of the business.

HENRY S. HALLWOOD,
Hallwood Cash Register Co., Cleveland, O.

Cash Register Industry. The cash register industry originated in the United States, which now exports each month large invoices of costly and improved registers to every civilized country. No such mechanisms have ever been imported into the United States; and indeed none are in general commercial use in Europe which were not manufactured in this country.

The simplest of such devices are what are known to the trade as Autographics; they are a box with, maybe, a cash drawer, a spring to open the same, a bell to be rung by the opening of the drawer, a roll of paper to be written on and then pass out of sight, for reference and preservation. Many of these autographics, for petty convenience, are manufactured; they require little notice, as they do not differ in principle from a pencil and slate.

The improved cash registers which have created an industry are in extensive use in retail stores, for the purpose of preserving a record of the sales made. Their primary object is to afford a convenient means of making a record, and to insure the accuracy of it, so that the proprietor may know at the end of each day the exact amount of the day's sales, and that each has been accurately and honestly registered. The essentials of such a mechanism have been stated to be: (1) a series of operating keys representing different amounts of money; (2) a registering mechanism upon which the values of the operated keys are added and preserved; (3) an indicating mechanism by which, when any key is operated, an indicating tablet representing the value of such key is exposed to view; (4) an alarm which is sounded by the operation of each key, to call attention to the exposed indication; and usually, (5) a money drawer which is automatically unlocked and thrown open at the operation of any one of the keys. The indicating mechanism gives utility to the machine by compelling the clerk to operate the proper key when he registers each sale. It is the protective element of the machine. Cash registers of the most improved type are not only widely used in stores, but, it is claimed, are "needed and can be sold wherever cash is handled."

The cash register industry has been wholly created within the last twenty years. Certain inventions, contributing some essentials of a successful register, had been known before at home and abroad; but in 1883, these were only models on paper, and no cash register had then been devised which was in commercial use in this or any other country. Prior to this date, however, the National Manufacturing Company at Dayton, Ohio,—a name since changed to National Cash Register Company—was making these machines under the Ritty & Birch patents, which were afterward upheld by the Supreme Court of the United States. They covered an improved device for holding and releasing the indicators.

None of the prior patented devices had either gone into use, or were fitted for practical use; so that in a commercial sense, Ritty & Birch were not only pioneers as to the extent of their improvement, but the actual creators of the first practical cash registers as a whole. The Ritty & Birch invention "brought success to what prior inventions had essayed and in some part accomplished."

The advantage thus obtained was followed

by great business enterprise and the liberal encouragement of further invention; the National Company now owns 537 Letters Patent of the United States and 394 foreign patents; and in its five invention departments at its factory, employs a corps of inventors, who are followed by forty skilled mechanics doing experimental work.

This company maintains branch factories at Berlin, Germany, and Toronto, Canada; but its main factories are at Dayton, Ohio. Here they occupy nine buildings, covering 892,144 square feet of floor space, and 140 acres of ground. In convenience and attractiveness, and for light, heat, ventilation and all sanitary things, these structures are designed to be models of any use for factory purposes. They have an output of about 5,000 machines per month; mostly of the newer and costlier kinds; about one-third of which are exported to foreign countries. These exported cash registers are adapted to the various currencies of England, Germany, Austria, Hungary, France and Belgium, Norway and Sweden, Holland, Spain, Cuba and Mexico and all Spanish-speaking countries, Brazil and Portugal, India, also Russia. Registers are sold for use in Japan and China, but not yet in the currency of those countries.

Among the more important improvements which inventors have worked out into practical advantage on a cash register may be named:

1. The totalizing counter, which adds all the registrations into one total.

2. The tape-printer, which prints the amount of each registration.

3. The check-printer, which prints, cuts off and throws out a check giving the figures of each registration, with the initials of the clerk making the sale.

4. The throw-out counter, which made it possible to print the amounts of all transactions on the detail tape and check which is issued, but prevents any amount, other than cash transactions, being so added into the totalizing counter.

5. A variation of the foregoing, which adapted it to print, instead of a check, an itemized bill, such as is used in the larger stores and offices.

6. The multiple-counter, which provides a separate adding mechanism for each person who operates the machine.

7. The multiple-drawer feature, or a series of cash drawers attached to one machine, giving the equivalent of many machines in one. This feature may be attached to the different types of registers, and gives the advantage of a separate machine for each individual, so that separate records are made not only of the transactions of each, but mistakes of any one of the different number of clerks using it, are readily identified.

8. Distant indication, which is a means for electrically indicating at a distance; namely, in the proprietor's office, home, or front show window, the sales made as registered on the machine.

Among newer improvements of cash registers are: (1) the application of electricity as a motive power, giving great rapidity of operation and saving of manual work; and (2) the application of cash registering mechanisms to conform to the special requirements of systems of express companies, telegraph companies, banking offices, department stores, post-offices, railroad offices, wholesale houses, telephone stations and government departments.

Firms who have, in the United States, made and sold cash registers are, or have been, Hopkins & Robinson, at Louisville; The Boston Cash Register and Indicator Co.; the Bensingers, at Chicago; the Sun, at Greenfield, Ohio; the Hallwood, at Columbus; the Kruse Co.; the Union, at Trenton, N. J.; the Globe and the Osborne, at Detroit; The Ideal, of New Jersey; the Chicago Cash Register Co.

Most of these manufacturers are out of active business, but they sold nearly all registers which remain in use in this country that are not Nationals. A cash register has this peculiarity about it, not common to other manufactured things,—the user often does not want it to work rightly; hence, to have value at all, it requires very high workmanship and perfection of part; and any device not so built, has not, thus far, been a commercial success. A good cash register must be one that cannot be beaten. To "beat" a register is to apparently operate it without proper indication and addition in registration. It must be built so as not only to operate accurately, but so that it cannot be prevented from working properly.

The National factory at Dayton employs 3,500 working men and women. About 40,000 persons annually visit this factory. A general interest, which this seems to indicate, and certain unique and perhaps original features in the factory methods of the National Cash Register Company, may justify a few words in explanation of them:

"There is no factory superintendent, but in place of such an official a chairman and a factory committee which holds daily or frequent sessions. This chairman after conference and advice from the committee, directs all departments in the making force. In and over each of all the departments, are subordinate committees, with a chairman who has like authority; and these all work in co-operation."

Nearly all important orders received by employes are first discussed and revised by these committees. In all the selling force, this system, "combining the methods of a military organization and a democracy into a somewhat novel co-operation," are in fixed and successful use. Liberal expenditures by the National Company and co-operative organization of employes for their "welfare work" seem to have won a deserved repute, at least are successfully carried out.

For officers and many of the men and women employes, attractive lunches are provided, for which a moderate charge is made, not intended to be the whole cost; training schools for employes, their children and others in the neighborhood; calisthenics, a dancing school, a boys' garden, rest rooms with a trained nurse and free baths on the company's time, libraries, and a cooking school are some of the interesting features annexed at the company's cost, to the factory work.

In connection with, and as a part of its system of co-operation, the company has paid out in the last five years, for prizes for suggestions alone, $10,152.68. During the year 1903, 5,078 suggestions were submitted in writing by the factory and office employes, of which number 1,536 were adopted, after having been first

passed to a special committee for careful examination and report. The company claims these "welfare" expenditures pay in the good will proffered, and in the good will and better work they produce.

A. A. THOMAS,
Secretary National Cash Register Co.

Cashan or **Kashan** or **Kashin,** a town of Persia in the province of Irak-Ajemee, noted for its production of shawls, silk stuffs, and other goods. It is one of the most flourishing towns in Persia, and has a royal palace, numerous mosques, colleges, bazaars and baths. The inhabitants are noted for their industry, and besides shawls and silk stuffs already mentioned, they manufacture copper goods, gold and silver articles, brocade and cottons. They also have an active trade in agricultural produce, and carry on commerce with all parts of the Orient and with Europe by way of Ispahan. The silk stuffs produced at Cashan are held in high esteem, and are worn largely by the Shah and his entourage. Foreigners from the West who have visited the place have found the inhabitants, who belong chiefly to the Shiite sect of Mohammedans, more enlightened and liberal in their treatment of strangers than most Orientals. Many of the merchants are very wealthy, but are compelled by the oppressive exactions of public officials to hide their riches as much as possible from view. The interior of the homes of some of them, which present a neglected aspect on the outside, are said to be palatial in splendor. The province of Irak-Ajemee, in which Cashan is situated, has nearly the same boundaries as the country known to the ancients as Great Media, or Media Proper. It is the most productive portion of Persia, fertile and with a flourishing trade. Cashan has a population of about 15,000. See PERSIA.

Cash'el, Ireland, a town in Tipperary County, about 49 miles northeast of Cork; noted as containing the most interesting ruins in Ireland. These consist of a Gothic cathedral founded in 1169; a stone-roofed chapel, built in 1127; Hore Abbey, founded in 1260; the palace of the Munster kings; and a round tower, 90 feet in height and 56 feet in circumference. They are built on the Rock of Cashel, forming the summit of the slope which the town occupies. Here was held the great synod, in 1172, when the Irish priests first acknowledged the authority of the English Church and state. Cashel is a Roman Catholic archdiocese.

Cashew' (a corruption of *acajou,* the French form of the native Brazilian name *acajaiba*), a tree (*Anacardium occidentale*) of the order *Anacardiaceæ,* common in the West Indies. It has alternate, obtuse, ovate leaves, and bears bunches of red, scented flowers. The juice of the stem is used as a varnish; and an aromatic drug is prepared by decoction and maceration of several parts of the tree, afterward consolidated by evaporation. The nut is small, kidney-shaped, ash-gray, and is seated on the end of a large fleshy receptacle. The shell consists of three layers, the outer and inner of which are hard and dry, but the intermediate layer contains a quantity of black, extremely acrid, caustic oil, which is destroyed by roasting the nuts before eating them. The oil is applied to floors in India to protect them from the attacks of white ants. A wine is made from the fleshy receptacle; and a gum with properties similar to those of gum arabic is obtained from the plant.

Cashgar, or **Kashgar,** the capital city of eastern Turkestan, in the province of Sin-Kiang or Kashgaria. It is situated on the Kizil-Daria or Kashgar River, in a position of strategic importance, 100 miles northwest of Yarkand, and comprises an old and a new town. The latter was built in 1838, is strongly garrisoned, and contains the palace of the Chinese governor. There are considerable manufactures of cotton, gold and silver cloths, carpets, etc., and an extensive trade, its position at the junction of several great routes making it the emporium of much of the commerce of central Asia. It was the capital of an independent kingdom till conquered by the Chinese during the 18th century. In 1865 it revolted but was again subdued in 1876–7. Pop. about 62,000.

Cashibo, kä shē'bō, or **Cachibo,** a savage tribe living near the Ucayale River, a tributary of the Amazon, in eastern Peru.

Cashier, To, in a military sense to dismiss from the service by annuling or withdrawing an officer's commission. It is not an official term in the United States, and is commonly construed among military men as having a more disgraceful significance than "dismissal," although there is no analogy or precedent in the use of the word by leading English authors to support this construction. Macaulay uses the term in the sense of simple dismissal or annulment of commission. Nevertheless in ordinary military parlance it means dismissal in disgrace, and its use in any other sense is regarded as unjustified.

Cash'mere, or **Kashmir,** a principality in the northwest of Hindustan, subject to a Maharajah belonging to the Sikh race, but under British protection and supervision. It is composed of various provinces or districts, of which Cashmere proper is the most famous and interesting. It is situated in the southwestern portion of the state, and largely consists of an elevated valley intersected by the Jhelum. Besides Cashmere proper, the state embraces the territory of Jamoo, Balti or Iskardo, and Ladakh and Gilghit. The whole principality thus formed is estimated to cover about 80,900 square miles, and its population in 1901 was 3,000,000. It extends from about lat. 32° to 37° N. and from about lon. 73° to 80° E. The territory of Jamoo, which forms the most populous portion of the principality, lies to the north of the Punjab, between the spurs of the Himalaya Mountains leading up to Cashmere and enclosed by the upper courses of the Chenab and Ravee. Its chief town is of the same name. Balti, also called Little Tibet, is an elevated region on the Upper Indus, to the north of Cashmere proper, lying to the southwest of the Karakorum Mountains, and having for its capital Iskardo or Skardo. Ladakh, also called Middle Tibet, lies to the southeast of Balti, between the Himalaya and Karakorum Mountains, and is also traversed by the Indus. Its passes form some of the most important media of communication for central Asia. Its capital is Leh on the Indus. Gilghit is a district on the northwest of Balti. Cashmere and Jamoo is the official title of the

whole. The principal river is the Indus, which traverses the state from southeast to northwest, and then takes a sharp turn to the southwest. The upper course of the Chenab is also in the state. Cashmere proper is a valley surrounded by gigantic mountains, belonging to the Himalayas, and traversed by the river Jhelum (formerly Hydaspes). The whole area of the enclosed region is about 4,500 square miles, and of the bottom of the valley about 2,000 square miles. From three sides only seven passes lead to this region; to the east the Himalaya presents an insurmountable barrier of snow. The splendor and sublimity of the diadem of snow-capped mountains, the beauty and richness of the hills which form the ascent to the higher peaks, it is impossible to describe. The elevated situation of the valley, and the mountains of snow which surround it, render the climate temperate; and it is, on the whole, pleasant and healthy. This region, about 5,200 feet above the sea, is watered by numerous streams, and is blessed with an abundance of the finest productions. The Asiatics therefore call it the paradise of India, the flower-garden, and the garden of eternal spring, and such names. The hills are covered with forests and Alpine pastures; at the foot of these are fields of corn; along the sides of the rivers rice is planted; rich orchards extend over the foremost ranges of hills; mulberry-trees are cultivated in abundance for the support of the silk-worms, and are entwined with vines, from whose grapes wine very similar to Madeira is prepared. The fruits of warm climates do not ripen here. The valley is famous for its flowers, with which all the gardens and meadows abound. Violets, roses, narcissuses, and innumerable European flowers, besides many that are not known in Europe, grow wild. The roses and jasmine yield the finest aromatic oils, which form an article of export. Two thirds of the inhabitants are Mohammedans, the remainder Hindus. The capital, Cashmere, is situated on the Jhelum. It is a dirty, ill-built town, extending on both sides of the river for about two miles, with few noteworthy buildings. Jamoo is the winter capital. Besides agricultural and pastoral pursuits the inhabitants carry on certain manufactures, especially woolens and artistic metal work. The manufacture of the celebrated Cashmere shawls is not so extensive as it once was, since manufactories have been established at Amritsir, in the Punjab, and elsewhere, which compete successfully with those of Cashmere. The genuine Cashmere shawls, however, are said to be of a better quality, owing to the fact that they are made of wool from the wild goat and other wild animals, this wool being, properly speaking, a soft down with which all the animals of this region are clad during the winter season. The shawls are woven in stripes, which are afterward very skilfully sewed together. Cashmere has had a varied history during the different periods distinguished as pro-Buddhistic, Buddhistic, Hindu, and Mohammedan. Buddhism, when driven from Hindustan, found a refuge in Cashmere. Mohammedanism was introduced in the 14th century. In 1586 the country was conquered by Akbar, and became part of the Mogul empire. In 1752 it was subjugated by the Afghans, under whom it remained till 1819, when it was conquered by the Sikhs. In 1846 the Sikh governor, Gholab Singh, made a separate treaty with the British, by which he acknowledged their supremacy, and agreed to lend them assistance when required. Accordingly he sent a contingent to act with the British forces against Delhi in 1857. A small annual tribute is paid to the British, partly consisting of Cashmere shawls. Under the supervision of the Indian authorities and the British resident at the court of Cashmere, great improvements in the internal condition of the state have recently been effected. The revenue system has been remodeled, and a new land revenue settlement has been completed. According to a recent blue book "An impulse has in consequence been given to agricultural pursuits, cultivation has increased, and local industries in silk culture, vineyards, wine factories, hop gardens, and orchards are being developed. . . . The posts and telegraphs in Cashmere have been taken over by the government of India, with the result of an increase in efficiency and of a saving in expense to the Cashmere state. The Cashmere troops have improved, and have shown their value in active service. Large expenditure has been incurred on public works, particularly on the improvement of the Jhelum and Gilghit roads, and on the construction in the capital, Srinagar, of water-works." A railway belonging to the Indian system now enters the country. The inhabitants are a fine race physically, tall, strong, and well built, with regular features. About two thirds of them are Mohammedans, the remainder mostly Hindus. Earthquakes frequently occur, and one that took place in 1885 caused the loss of thousands of lives.

Cashmere Goat (*Capra hircus*, var. *laniger*), a variety of the common goat remarkable for its fine downy fleece, said to be found in perfection only in Tibet, but also found elsewhere, as in Ladakh or Middle Tibet, now a province of the principality of Cashmere. It is found both in a wild state and as a domestic animal; the former is said to yield the best wool or down. The favorite food of these animals is said to be buds, aromatic plants, rue, and heath. The people of Tibet give the goats at least once a week some salt. If they are transferred from their cold mountainous abode into a warm country, the wool deteriorates. It grows very slowly in the warm part of the year, and more vigorously as the cold season approaches. The colder the region the heavier is the animal's fleece. Proper food and careful tending increase the fineness of the wool. Yearlings, as in the case with the merino sheep, afford the finest wool. A full-grown goat yields not more than eight ounces. The goats which pasture in the highest vales of Tibet have a bright ochre color. In lower grounds the color becomes of a yellowish-white, and still farther downwards, entirely white. The goats of Tibet and Cashmere have the fine curled wool close to the skin, just as the under hair of our common goat lies below the coarse upper hair. The wool is shorn in the spring, shortly before the warm season — the time when the animal in its natural state seeks thorns and hedges in order to free itself from the burden of its warm covering. A large shawl of the finest quality requires five pounds of the wool; one of the inferior quality from three to four pounds. The flesh of the Cashmere goat tastes as well as that of the common one, and its milk is as rich if it is well tended.

Casiguran Bay, kä-sē-goo'rän, an inlet on the east coast of the province of Principe, Luzon, Philippine Islands, reached through Casiguran Sound. The sound is about nine miles long from Cape Ildefonso to a narrow passage affording access to the bay. The bay itself is about three quarters of a mile long and two and a half miles wide. Its depth is some 16 to 26 fathoms.

Casimir, kăs ĭ mēr, properly **Kazimierz** ("founder of peace"), was the name of many Polish princes and kings. 1. CASIMIR I., b. 1015; d. 1058. During his minority he was under the regency of his mother and was driven from the kingdom with her. In 1041 his power was re-established, and through his efforts the predominance of Christianity was decided in Poland. 2. CASIMIR III., b. 1309; d. 5 Nov. 1370, called Casimir the Great, who succeeded his father, Vladislav Loketek, as king of Poland in 1333, was the most distinguished of this name. He added Little Russia and Red Russia to his dominions, and repelled the Tartars, who then threatened Poland. He founded the University of Cracow (1364), as well as several schools and hospitals, and showed great anxiety for the advancement of the arts and of learning in his kingdom. In 1347 he caused a new code of laws to be compiled, and protected the peasants, on which account he was called the peasants' king. He had a Jewish mistress who procured for her nation those liberties which they enjoy in Poland to the present day. With him the line of the Piasti, which had ruled in Poland for nearly 530 years, became extinct.

Casimir-Perier, Jean Paul Pierre, President of the French republic: b. Paris 8 Nov. 1847. He served in the Franco-Prussian war, and received the decoration of the Legion of Honor for bravery. In 1876 he was elected to the Chamber of Deputies; in 1890 vice-president of the chamber, and in 1893, president. He resigned to become premier, which office he held till the assassination of President Carnot, when he was chosen his successor on the first ballot (June 1894). He resigned the office of president, January 1895, and was succeeded by Félix Faure.

Casino, kȧ sē'nō, or **Monte Casino,** a celebrated Benedictine abbey in Italy, in the Neapolitan province of Caserta, near the small town of South Germano, and about 45 miles from the city of Naples, founded by St. Benedict of Norcia in 529. It is situated on a mountain, from which it derives its name, near the ruins of the ancient Casinum, and is approached by a well paved and winding road. The abbey, after having suffered repeated reverses, finally became considerable for its privileges and its wealth, and in the 11th and 12th centuries was the seat of science, particularly of medicine, the celebrated school of Salerno having been founded by the monks of Monte Casino. The church is very magnificent, although overloaded with ornament, and contains the tomb of the founder. The monastery has served as a place of refuge to several sovereigns and pontiffs, and was formerly much visited by pilgrims and travelers, who were entertained free of expense. It is still visited by travelers or tourists, but it is no longer a conventual institution, being now devoted to education. The railway from Rome now passes near it.

Casino, a name generally given to a kind of club-house or place of amusement, containing rooms for dancing, playing at billiards, etc. The word is originally Italian, being a diminutive of the Italian word *casa,* signifying a house; and was at first applied to small houses which the nobles of Florence, Venice, and other Italian cities often possessed at a distance from their ordinary residences, and which were devoted to purposes of social enjoyment.

Casiri, kä-sē'rē, **Michael,** Orientalist and Syro-Maronite clergyman: b. Tripoli, Syria, 1710; d. Madrid 1791. He studied in the College of St. Peter and St. Marcellino; and in 1734 entered the clerical profession. The following year he accompanied the learned Assemanni to Syria, where he was going, at the command of the Pope, to attend the synod of the Maronites, and in 1738 gave, at Rome, an exact account of the religous tenets of the Maronites. He afterward taught in his monastery the Arabic, Syrian, and Chaldee languages, theology and philosophy; and in the year 1748 was invited to Madrid, where he was appointed to an office in the royal library. In 1749 he devoted his attention, by the king's orders, to the library of the Escurial, of which he subsequently became the superintendent. Here he collected the materials for his celebrated work, 'Bibliotheca Arabico-Hispana,' which enumerates in 1851 articles the manuscripts of the Escurial Library, perhaps the richest in Europe in Arabic manuscripts. This work, though not entirely free from errors, contains very important information and valuable extracts, and is indispensable to every Orientalist.

Caskets, The, a group of rocks in the English Channel, seven miles from Alderney. They have often been fatal to vessels, and, in 1119, Prince William, son of Henry I., and his suite, perished here. In 1744 the Victory ship of war, of 110 guns, also was shipwrecked upon them. On the highest there is a lighthouse.

Cas'ler, John Overton, American soldier: b. Frederick County, Va., 1 Dec. 1838. He served in the Confederate army during the Civil War and was a prisoner of war from February to May 1865. He lived in Texas 1877–89, and has since been a resident of Oklahoma City, where he is justice of the peace. He is the commander of the Oklahoma division of United Confederate Veterans, and has published 'Four Years in the Stonewall Brigade' (1893); 'Lilian Stuart, the Heroine of the Rappahannock' (1889).

Casoria, kä-sō-rē'ä, Italy, a town in the province of Naples (Napoli), six miles north-northeast of Naples. It has four fine churches, and is the residence of a district judge. Silk is produced in the neighborhood. Pietro Martino, the painter, was born here. Pop. about 10,000.

Caspari, käs-pä'rē, **Karl Paul,** German Church historian: b. Dessau 8 Feb. 1814; d. 11 April 1892. He became professor of theology at Christiania in 1857. His Arabic grammar is in high repute, and his contributions to the study of the Old Testament include works on Obadiah, Isaiah, Micah, and Daniel. Besides his 'Anecdotes of Ecclesiastical History'

he published at Christiania 'The Origin of the Story of the Baptismal Symbol, and the Rule of Faith,' extensions of which appeared in 1875 and 1879.

Caspe, käs'pā, Spain, a town in the province of Zaragoza, 12 miles north-northeast of Alcañiz, left bank of the Guadalupe, near its confluence with the Ebro, on several small hills and in the intervening valleys. It has paved streets, one principal and nine smaller squares, a handsome Gothic collegiate and two other churches, several chapels, three schools, a town-hall and prison in a suppressed convent, an hospital, and several public fountains. Manufactures — wine, oil, and soap. Some trade is also carried on in grain and cattle. Pop. 8,427.

Cas'pian Gates, a name given to the Russian fortress Dariel, situated in a narrow defile of the Caucasus, on the Terek, 80 miles north of Tiflis.

Caspian Sea, a large lake or inland sea between Europe and Asia, now nearly surrounded by Russian territory but having Persia on the south; 730 miles in length from north to south, and from 130 to 270 in breadth; area about 170,000 square miles; the largest isolated sheet of water on the globe. The water is less salt than that of the ocean, of a bitter taste, and of an ochre color, without ebb or flow. In some places it is exceedingly deep, yet it abounds in shallows, so as to prevent the navigation of ships which draw more than 9 or 10 feet of water. The level of the Caspian Sea is considerably lower than that of the ocean. Among the rivers which flow into it are the Volga, Ural, Terek, and Kur. In ancient times the Oxus (Amoo Daria) also flowed into it. It has no outlet. The fisheries here, which are very valuable, occupy and train many seamen. Sturgeons and sterlets are caught in great quantities, and there are also salmon-trout, perch, *Silurus glanis,* two kinds of carp, and porpoises; seals abound in the upper coasts, and tortoises between the mouths of the Volga and the Ural. In the northern region the first fishing season, called the caviar season, occurs between March and May, when the Volga, Ural, etc., are getting cleared of ice. The second season is in July, when the sturgeon descend the rivers; and the third or open-sea fishing goes on from September to November. The only ports at all worthy the name on or near the Caspian are Astrakhan, Baku, Derbend, and Astrabad (in Persia). The navigation is at all times difficult and often perilous. Steam packets are now established on this sea. The Russians have also a fleet of war vessels in the Caspian, and a new naval station has been established at Krasnovodsk, on the east side of the sea. By means of river and canal there is water communication between the Caspian and the Black Sea, Baltic, and White Sea.

Cass, Lewis, American statesman, diplomatist, and soldier: b. Exeter, N. H., 9 Oct. 1782; d. Detroit, Mich., 17 June 1866. In 1800 he removed to Marietta, Ohio, where he entered on the study of the law. He was admitted to the bar in December 1802, and soon after established himself at Zanesville, where he gradually acquired practice. In 1806 he was elected to the Ohio legislature. He served in the first year of the second war with England and in 1813 was appointed governor of Michigan Territory, holding office till July 1831. Michigan at this time had no territorial legislature, and the business of selecting laws for it from the codes of the States devolved on Governor Cass and the territorial judges. Governor Cass was also *ex officio* superintendent of Indian affairs for the territory, which then included what now constitutes the two States of Michigan and Wisconsin, and this remained for several years the most important part of his duties. Of all this extensive territory, it was only a little tract bordering on Lake Erie and the Detroit River to which the Indian title had yet been extinguished. Within the bounds of his Indian superintendency, ultimately made to embrace all the tribes northwest of the Ohio, there were reckoned to be 40,000 Indians, mustering at least 9,000 warriors. The recent hostilities, and the distrust and suspicions of the Indians, occasioned by the constant calls upon them for additional cessions of land, rendered this office one of great delicacy and difficulty. But Governor Cass, while steadily carrying out the policy of acquisition, succeeded also in maintaining the respect, and even in securing the affection of the Indians. In 1817 he obtained, in conjunction with Governor McArthur, a cession of most of the remaining Indian lands within the state of Ohio, with adjoining tracts in Indiana and Michigan, to the extent of 4,000,000 acres in the whole. This cession removed the Indian barrier hitherto intervening between the settlements of Ohio and those of Michigan. In 1819 he met the Chippewas at Saginaw, and obtained a cession of lands in the peninsula of Michigan to the extent of 6,000,000 acres. As yet the northwestern regions were very imperfectly known. At the suggestion of Governor Cass, an expedition, in which he himself bore a conspicuous part, and of which an account has been published by Schoolcraft, was set on foot in 1820, for exploring the northern shore of Lake Superior, and the course of the upper Mississippi. The next year, by a long, circuitous river navigation, he visited Chicago, then nothing but a military post, with a wide wilderness all about it, and there made a treaty with the Chippewas, Ottawas, and Potawatamies, by which a large additional tract was obtained, completing the extinction of the Indian title to the peninsula of Michigan south of Grand river. In 1828 he made two treaties, one at Green Bay, the other at St. Joseph's, by which many millions of acres were ceded to the United States. Up to his resignation of the office of governor of Michigan, in July, 1831, he had concluded 19 treaties with the Indians, by which cessions had been acquired in Ohio, Indiana, Illinois, Michigan, and Wisconsin, to an amount equal to nearly or quite a fourth part of the entire area of those states. When President Jackson reconstructed his cabinet in August, 1831, Cass was appointed Secretary of War. The policy of the removal of the Indians, especially the southern tribes, to districts west of the Mississippi, had been warmly espoused by Gen. Jackson. The defense of this policy, which had elicited much criticism and a warm opposition, was ably entered upon by Secretary Cass in his first annual report. In 1836 he was appointed minister to France, a post which he held till 1842. He was on excellent terms with Louis Philippe, of whose character he gave a very friendly and favorable account in his 'King, Court, and Gov-

ernment of France,' published in 1840, originally as an article in the 'Democratic Review.' By far the most remarkable incident of his diplomatic career occurred just at its close, in his attack on the quintuple treaty for the suppression of the slave trade. He was United States Senator (1845–8), and having opposed the Wilmot Proviso, became the Democratic candidate for President in 1848, but was defeated. He returned to the Senate in 1849, and was secretary of state (1857–60), resigning because President Buchanan would not consent to strengthen the garrison at Fort Sumter. He wrote: 'History, Traditions, and Languages of the Indians' 1823; 'France, Its King, Court, and Government.' See 'Lives' by Schoolcraft (1848); Smith (1856); McLaughlin (1891).

Cassagnac, Adolphe Bernard Granier de, ăd-ŏlf bär-när grä-nē-ā dė käs sän yäc, French journalist and politician: b. 1806; d. 31. Jan. 1880. He began his career at Paris as contributor of literary criticisms to the *Journal des Débats,* and soon made himself known, and latterly notorious, as editor of various papers, the *Globe,* the *Pouvoir,* the *Pays,* etc., and as being involved in many controversies and duels. He published various books, chiefly historical. Among the principal are: 'Portraits Littéraires'; 'Histoire des Causes de la Révolution Française'; 'Histoire des Girondins'; 'L'Empereur et la Démocratie Moderne.'

Cassagnac, Paul-Adolphe Marie Prosper (pōl ăd-ŏlf mä-rē prōs păr) **Granier de,** son of Adolphe; had a career and a reputation not dissimilar to those of his father. He was born 2 Dec. 1842. He was taken prisoner at Sedan in 1871, and underwent eight months' confinement in Silesia. His violent advocacy of Bonapartism led him into innumerable duels, and he was on several occasions summoned for libelous articles in the *Pays* and other newspapers. He was a vigorous supporter of Gen. Boulanger, but his violence in later years somewhat abated. Since 1884 he has edited a journal known as *L'Autorité.* He has written a 'Histoire de la Troisième République' (1875); 'Empire et Royanti'; 'Memoires de Chislehurst.'

Cassan'der, king of Macedon, son of Antipater: b. about 354 B.C.; d. 297 B.C. He disputed the sovereignty of Macedon with Polysperchon, whom Antipater had appointed regent at his death in 319 B.C. Allying himself with Ptolemy and Antigonus, he conquered Athens; captured Olympias, the mother of Alexander the Great, and put her to death; and connected himself with the royal family by marrying Thessalonica, half-sister to Alexander. He joined, in 315 B.C., the coalition against the growing power of Antigonus; murdered the rightful heir to the throne, Alexander Ægus, and his mother Roxana; and took the title of king in 306 B.C., which was confirmed to him by the decisive battle of Ipsus in 301 B.C.

Cassan'dra, also **Alexandra,** daughter of Priam and Hecuba, and twin-sister of Helenus. Both children, according to tradition, were playing in the vestibule of the temple of the Thymbræan Apollo, not far from Ilium; and having stayed there too late to be carried home, a couch of laurel twigs was prepared for them, for the night, in the temple. When the nurses went to them the next morning they found two serpents at the side of the children, which, instead of injuring them, harmlessly licked their ears. This miracle produced a still greater one: the hearing of the children was rendered so acute that they could distinguish the voices of the gods. Cassandra subsequently spent much of her time in the temple of Apollo, who, becoming enamored of her charms, disclosed to her all the secrets of the prophetic art, and in return demanded her love. But Cassandra, when her curiosity was satisfied, refused the dishonorable reward. Apollo, incensed at this, solemnly decreed that her prophecies should never find belief. She frequently and continually foretold the destruction of Troy, and warned her countrymen in vain against the deceitful horse. When Troy was conquered, and Cassandra, with the other maidens, fled to the temple of Minerva, Ajax, son of Oïleus, tore her from the altar, deflowered the virgin in the sacred place, and dragged her away to the other female slaves, with her hands tied. On the division of the booty she fell to Agamemnon, who carried her as his slave and mistress to Mycenæ. Clytæmnestra murdered them both. Agamemnon had twins by her — Teledamus and Pelops, who were put to death by Ægisthus. The ancients regarded this rape of Cassandra as a most infamous atrocity. It has often afforded a subject to poets and sculptors. The Locrians, the countrymen of Ajax, were afflicted on this account for many years with storms, and their country was desolated with the plague.

Cassandra, the most westerly of the three tongues of the Chalcidic peninsula, between the gulfs of Salonica and Cassandra. Its ancient name was Pallene. The Gulf of Cassandra was anciently Toronaicus Sinus.

Cassano d'Adda, käs-sä'nō dăd'dä, Italy, a town in the province of Milan, and 16 miles north-northeast of the town of Milan, pleasantly situated on a hill on the right bank of the Adda. It is very old, and built mostly of bricks. A bridge of 800 paces connects it with the opposite bank of the river. There are numerous silk-mills. Its military position on the right bank of the Adda has caused it to be the scene of several battles. Here Ezzelino da Romano, the leader of the Ghibellines in Italy, in the time of the Emperor Frederick II., was defeated in 1259; here also Prince Eugene was defeated in 1705, by the Duke de Vendôme, and the French under Moreau, by Suwarow in 1799. Pop. of commune about 10,000.

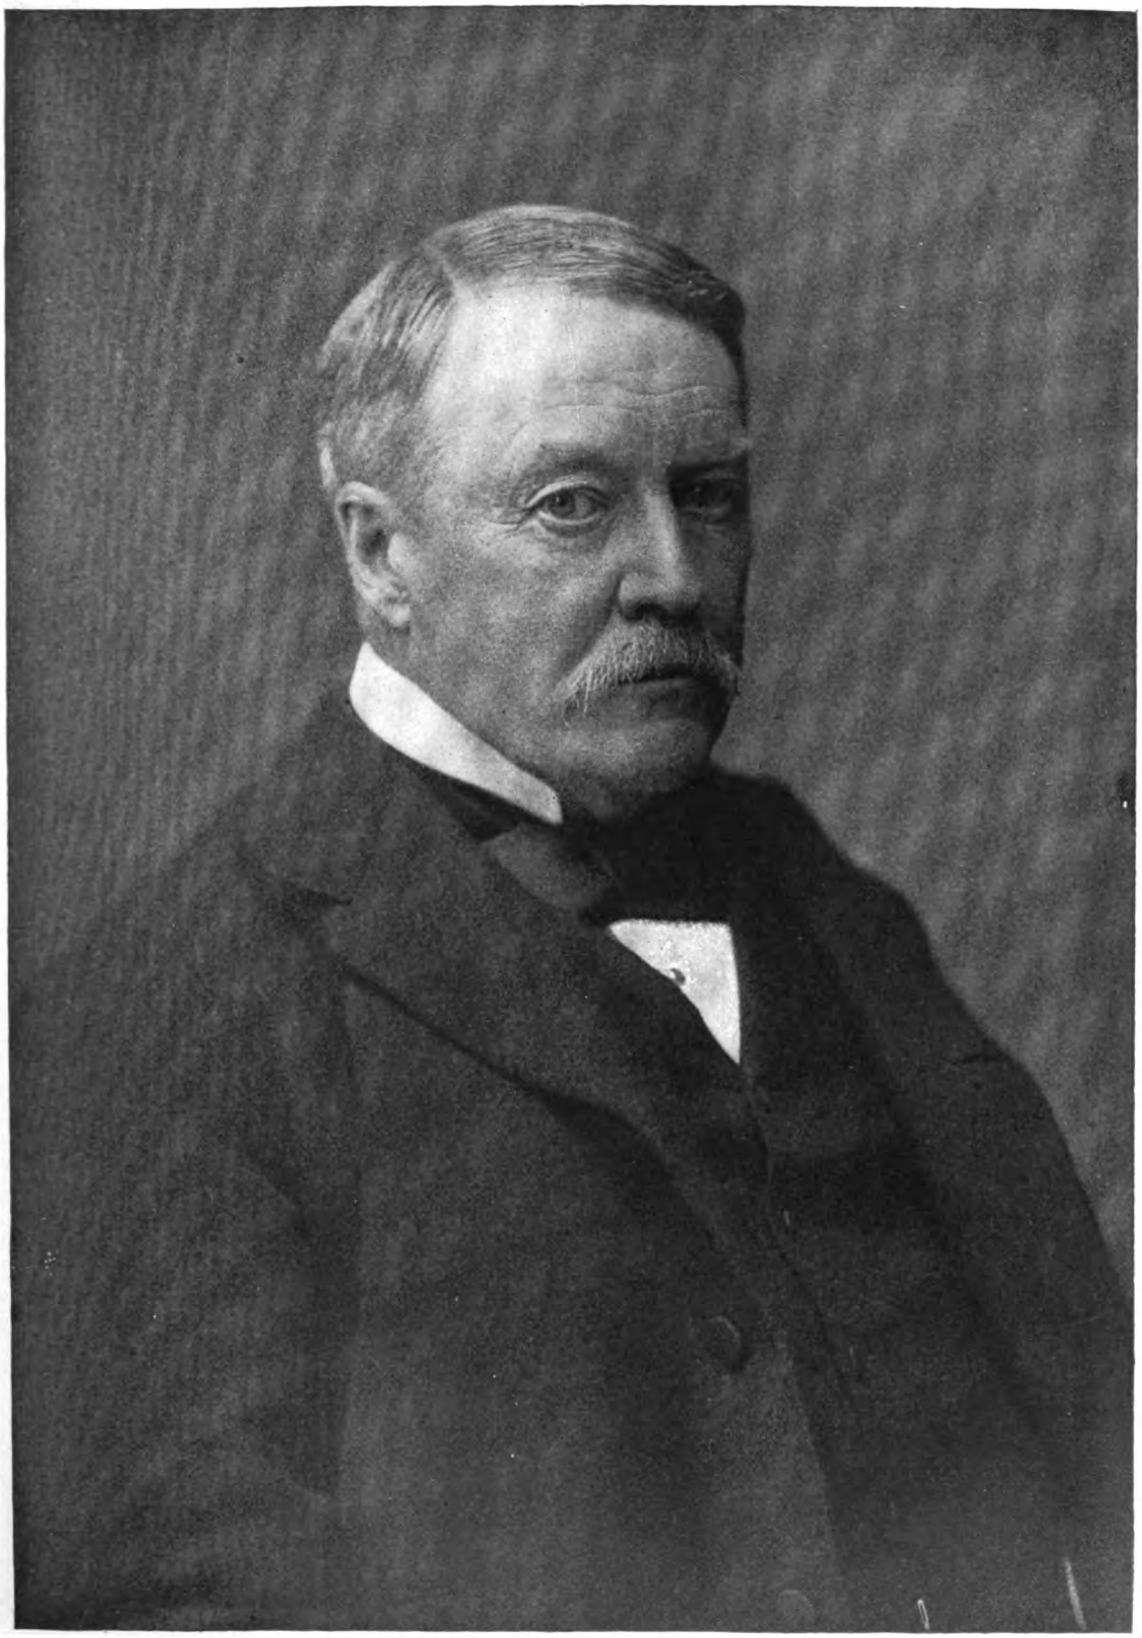
Cassareep, kăs'sa-rēp, **Cassireepe,** or **Cassiripe,** the concentrated juice of the roots of the common or bitter cassava (*Manihot utilissima*), flavored by aromatics, and deprived of its poisonous properties by boiling. It is used to give a relish to soups and other dishes, and forms the basis of the West Indian "pepperpot." It is a powerful antiseptic, and is very useful in keeping meat fresh in a tropical climate.

Cassas, Louis François, loo-ē frăn-swä käs-sä, French landscape-painter and architect: b. Azay-le-Ferron, 1756; d. 1827. He went to Italy when very young, and carried with him a collection of views from nature, which he afterward enlarged by others taken in Sicily, Istria, and Dalmatia. He next accompanied the Count of Choiseul Gouffier, ambassador to Constantinople, compared the topography of Troy with the accounts given of it by the ancients, took drawings of the remains and the surround-

ing country, and traveled through Asia Minor, Syria, Palestine, and part of Egypt. On his return he was appointed inspector and professor of design at the Gobelins in Paris. The models which he had made of the most celebrated architectural works of different countries were purchased by Napoleon, who rewarded him with a pension, and caused them to be placed in the Parisian School of Arts. From the materials collected in his travels have been compiled 'Voyage Pittoresque de la Syrie, de la Phénicie, de la Palestine, et de la Basse Égypte' (1799), and 'Voyage Historique et Pittoresque de l'Istrie et de la Dalmatie' (1802, with sixty-nine copper plates). The original drawings for both works were admirable oil paintings, and they were deposited in the Bibliothèque Royale. Cassas was invested with several orders of knighthood.

Cassation, a term used in the courts on the Continent of Europe. It is derived from the Middle Ages, and signifies the annulling of any act or decision if the forms prescribed by law have been neglected, or if anything is contained in it contrary to law.

Cassation, Court of (*Cour de Cassation*), one of the most important institutions of modern France, which gives to the whole jurisdiction of that country coherency and uniformity without endangering the necessary independence of the courts. It was established by the first National Assembly, and has been preserved, in every essential respect, under all the changes of the Revolution and Restoration. It has been maintained even in those districts which, by their union with France became subjected to French laws, but by the Peace of Paris again became part of the Prussian monarchy. In France, as early as the reign of Louis IX. (1226–70), petitions were presented to the king by appellants from the decisions of the courts. In later times appeals to the parliaments, as the highest courts of the kingdom, came into use, and their decisions were not liable to be set aside by the ordinary forms of law. Yet the parties were allowed to dispute even these decisions if they were founded upon errors of fact or violated undisputed principles of law; and by an ordinance of 1302 it was provided that the parties should be allowed royal letters for the defense of their rights against the decisions of the supreme courts (*lettres de grâce de dire contre les arrêts*), which should be issued from the chancery (by the chancellor of France). The case was then sent back to the parliament for further investigation, but was examined and decided in the presence of the king himself, or of a special commissioner. An abuse, however, crept in of transferring these cases to the royal council, where they were decided by officers called *maîtres des requêtes.* These letters received the name of *lettres de proposition d'erreur,* and during the civil commotions at the end of the 14th century began to be more frequently presented to the council, which, as soon as one party complained of the partiality of the parliaments, transferred the case to its own bar, and obstructed the course of justice by *lettres d'état* suspensions of the process, on the pretext of the absence of one of the parties in the service of the king). Under the Chancellor Poyet (1538–42), this abuse reached its highest pitch; but the Chancellors Olivier (1545–51), and Hôpital (1560–8), the two great reformers of French jurisprudence, limited the use of these *lettres* till, by the Ordinance of Blois (1576), all the provisions against the decisions of the parliaments were reduced to these three: — the *proposition d'erreur,* for an error of fact; *requête civile,* to restore the parties to their former condition on account of the fraud of one of the parties or the mistakes of the attorney; and *cassation* (petition for abrogation), for violation of forms or settled principles of law. By the famous Order of Procedure of 1667 the first of these provisions was abolished, but the province of the *requête civile* and *cassation* was enlarged and more precisely defined. The former was always brought before the court itself and decided there, the latter before the council. For this purpose, in the *conseil privé,* or *conseil des parties,* a particular committee was formed, consisting of the chancellor, the four secretaries of state (ministers of the departments), the council of state, and all the *maîtres des requêtes* (in 1789, 78 in number). The decisions of this committee were too much influenced by the will of the king and the ministers, and by various other circumstances, so that they did not enjoy great respect, though they often exposed acts of great injustice on the part of the parliament and other high courts. It was therefore abolished in the first National Assembly, and its place supplied by an independent court — the *tribunal de cassation* (decrees of 27 Nov. and 1 Dec. 1790), which was retained in all the constitutions and received under the imperial government (1804) the name *cour de cassation,* which it still retains. It consisted, according to the organization of 1800, of 48 members, chosen from the senate, on the nomination of the consuls, who elected their own president from among themselves. The appointment of president was afterward vested in the emperor. In the *Charte Constitutionelle* of 1814 the number of members of the *court de cassation* was fixed at 49, at which it still remains. The members are appointed for life by the president of the republic, and consist of a first president, three presidents of sections, and 45 councilors, besides certain honorary members. The minister of justice, or keeper of the seals (*garde des sceaux*) has the right of presiding on certain occasions. This court never decides on the main question at issue, but on the competency of the other courts and on the petitions to have their decisions reviewed or annulled, and assigns the question to another court if a decision is to be set aside for an evident violation of the forms or the principles of the law. For this purpose it is divided into three sections or chambers: — the *chambre des requêtes,* which decides on the admissibility of the petitions in civil cases; the *chambre de cassation civile;* and the *chambre de cassation criminelle.* After a decision has been reversed, if a second court decides the same case in the same way, and an appeal is entered again, the court of cassation must either request an authentic explanation of the law from the government, or at least all the three sections must unite, to pronounce a second reversal or cassation; and if a third decision is the same as the preceding, the court before which the case is again brought must submit to the doctrine of the court of cassation on the point of law in dispute. This system, which dates from 2 April 1837, gives great authority to this court



A. J. CASSATT,
President Pennsylvania Railroad Company.

Mail

in matters of jurisprudence. According to the law in force before 1837, the court before which a case was brought for decision a third time was not required to adopt the views of the court of cassation, but after the third decision there was no further appeal. The government, however, in that case gave an authentic interpretation of the law if there was any occasion for so doing. Until the end of 1852 there was a similar court of cassation for the Prussian province of the Rhine, but in 1853 its jurisdiction was transferred to the supreme Prussian tribunal sitting at Berlin. The sentences of the court of cassation are not only recorded in the journals of the courts, the decisions of which are reversed, but published likewise in an official bulletin, by which consistency and uniformity are preserved. The tribunal of cassation has enjoyed from its commencement the respect and confidence of France, and has numbered among its members several of the most distinguished lawyers; as the President Henrion de Fansey, the councilors, Chabot, Merlin, and Carnot.

Cassatt', Alexander Johnston, American railway president: b. Pittsburg, Pa., 8 Dec. 1839. He was educated in the University of Heidelberg, and the Rensselaer Institute, Troy, N. Y., and in 1859 was employed as civil engineer in surveying a railroad route in Georgia. He entered the service of the Pennsylvania Railroad as rodman in 1861, became general superintendent of the Pennsylvania system and general manager of the lines east of Pittsburg, 1871-4; third vice-president, 1874; and first vice-president, 1880. He resigned this last-named post in 1882, but was elected a director in 1883, and in June 1899 was elected president of the Pennsylvania system. He is at present the president of seven companies, and a director in 23, including transportation, banks, and trust companies.

Cassatt, Mary, American artist b. Pittsburg, Pa., about 1855. In 1875 she went to Europe to study art, and lived for some years in Spain, where she gave particular attention to the works of Velasquez. Removing to Paris, she was influenced by the work of Manet and Legas, and exhibited in the Impressionist Exposition about 1880. In 1898 she exhibited some of her works in New York city. Returning to Europe, she established a studio in Paris, where she has since lived. She has gained considerable fame as an etcher, ranking among the first of the modern artists in this medium.

Cassava, kăs-sä'va, **Manioc,** măn'ĭ-ŏk, or **Mandioc,** a South American shrub (*Manihot utilissima*) belonging to the natural order *Euphorbiaceæ*, sub-order *Crotoneæ*. There are two forms, popularly known as bitter and sweet, both of which are widely cultivated in tropical America for their fleshy, cylindrical, starchy roots, which form a large part of the food of the natives, and from which tapioca is made. They have also been introduced into other warm countries, especially Africa, and have quickly gained important positions as food crops.

The plant, which attains a height and breadth of four feet or more, is rather bushy, since its numerous knotty, brittle, pithy stems have many palmate leaves. The flowers, which appear in midsummer, are green or yellowish and inconspicuous, and are succeeded by wing-angled capsules. The best results are obtained on light, sandy, well-drained soils. The land is prepared as for corn, but instead of planting seed, stem cuttings are covered by the plow, and when the plants appear they are cultivated with the same implements used in corn-growing. In about seven months the white soft roots, which occasionally weigh 30 pounds, and are sometimes three feet long and three inches thick, are dug by hand, washed, grated, or ground to pulp. The juice, or poisonous part, is carefully pressed out, and when boiled, becomes the delicious sauce called cassar, much esteemed by epicures. The flour that remains after pressure is formed into thin, round cakes, and baked. To a European accustomed to eat bread, these, though sweetish and not unpalatable, have an insipid taste. If placed in close vessels, and preserved from the attacks of insects, cassava bread may be kept for several months without injury.

Poisoning by the bitter cassava is due to the presence of minute quantities of hydrocyanic acid. This is a very common ingredient of many fruits and seeds, but usually is modified as the fruit ripens. The general process of manufacture of cassava destroys or drives off the free hydrocyanic acid. The symptoms of this poison are very acute. Death is very sudden from paralysis of the heart and respiratory centres. Non-fatal poisoning is accompanied with great prostration, nausea, vomiting, and collapse. There are no efficient antidotes.

The natives of South America throw a number of cakes of cassava together to heat, after which they soak them in water, which causes a rapid fermentation to take place; and from the liquor thus obtained they make a very sharp and disagreeable, but intoxicating beverage, which will not keep longer than 24 hours without spoiling.

From the pure flour of cassava is formed the substance called tapioca, which is frequently used for jelly, puddings, and other culinary purposes. This is separated from the fibrous parts of the roots by taking a small quantity of the pulp after the juice is extracted and working it in the hand till a thick, white cream appears on the surface. This, being scraped off and washed in water, gradually subsides to the bottom. After the water is poured off the remaining moisture is dissipated by a slow fire, the substance being constantly stirred, until at length it forms into grains about the size of sago. These become hard by keeping, and are the purest and most wholesome part of the cassava.

The roots of another species of this shrub, called sweet cassava (*Manihot aipi*), the juice of which is not poisonous, are usually eaten with butter, after being roasted in hot ashes. They have much the flavor of chestnuts, and are an agreeable and nutritive food, containing about 30 per cent of carbohydrate materials. The roots of the sweet cassava are also used as stock-food and to make glucose and starch. Florida is the only State in which sweet cassava has attracted much attention, but it seems to be not very profitable there on account of the high price of labor and fertilizers.

Cassegranian Telescope, a form of the reflecting-telescope in which the great speculum is perforated like the Gregorian, but the rays converging from the surface of the mirror are

reflected back by a small convex mirror in the axis of the telescope, and come to a focus at a point near the aperture in the speculum, where they form an inverted image, which is viewed by the eyepiece screwed into the tube behind the speculum.

Cassel, käs'sĕl, or **Kassel,** formerly the residence of the Elector of Hesse-Cassel, and now the chief town in the Prussian province of Hessen-Nassau, lies on the Fulda, 91 miles north-northeast of Frankfort-on-the-Main. It is divided into the Altstadt, or Old Town; the Ober Neustadt, or Upper New Town; the Unter Neustadt, or Lower New Town; and the new West Quarter; all but the third being on the left bank of the river. Cassel has several fine squares, or open areas, on the principal of which, the Friedrichsplatz, stands the electoral palace, an indifferent structure; and next to it the museum, a handsome building, containing a library of 170,000 volumes, and many valuable MSS. At one end of this area is a handsome triumphal arch and war monument overlooking the Fulda valley, in which is the Karlsaue, finely laid out, and forming a favorite promenade. On this side of the city are also the building for the courts and government offices, the Bellevue palace containing the academy of arts, and the handsome picture-gallery containing some fine examples of the old masters, especially the Flemish and Dutch. The other more noticeable public areas are the Königsplatz, in the form of a circle; the Friedrich-Wilhelmsplatz, with an ornamental fountain; the Ständeplatz, a broad tree-planted avenue, etc. The most noteworthy church is the Protestant church of St. Martin, with a nave of the 14th and a choir of the 15th century. An observatory is likewise situated here. Cassel has iron-foundries and machine-shops, works for railway-carriages, mathematical instruments, pianos, gloves, jute works, etc. In the vicinity is Wilhelmshöhe, the ex-elector's summer palace, the temporary residence of Napoleon III. after Sedan. Pop. (1901) about 107,000.

Cas'sia, a genus of leguminous plants, of the tribe *Cæsalpineæ,* inhabiting the tropical parts of the world, consisting of trees, shrubs, or herbs, the leaflets of several species of which constitute the well-known drug called senna. That imported from Alexandria is obtained from *C. acutifolia* and *C. obovata. C. fistula* is found wild in India. Its legumes contain a quantity of thick pulp, which is a mild laxative and cathartic, and enters into the composition of the confection of cassia and the confection of senna. It belongs to the sugar class of laxatives, its properties being due for the most part to the water-attracting properties of sugar while in the intestinal canal. The leaves and flowers are also purgative. The bark and roots of several of the Indian species are much used in medicine. "Cassia bark" is a common name for the bark of an entirely different plant, *Cinnamomum cassia,* belonging to the laurel family. It is much imported into Europe, mostly from China, and is also called *Cassia lignea.* Its flavor somewhat resembles that of cinnamon, and as it is cheaper it is often substituted for it, but more particularly for the preparation of what is called oil of cinnamon. The cassia of the Bible was probably cassia bark. Cassia buds, which are similar in flavor, are the unripened fruits of this tree.

Cassia'nus, otherwise called JOANNES MASSILIENSIS and JOANNES EREMITA, early theological writer and zealous advocate of the monastic system, who flourished in the early part of the 5th century, but so little is known of the time and place of his birth that it is still doubtful whether he was a Scythian, Greek, or Roman. It is certain, however, that he traveled extensively in the East, and was long a pupil and deacon of Chrysostom. When the latter, through the intrigues of his opponents, was removed from the episcopal chair, Cassianus was sent with Germanus to Rome to present a memorial from the clergy who adhered to Chrysostom. Here he became personally acquainted with Pelagius. About 415 he went to Marseilles, where he continued a course of restless activity as a presbyter till his death, which took place some time between 430 and 450. He founded two monasteries on the principles laid down by him in his works 'De Institutis Cœnobiorum' and 'Collationes Patrum Sceticorum' (that is, 'Conferences of the Monks in the Desert of Sketis'). The views advanced in these works, and still more the strong leaning which he showed to the dogmas of Pelagius, involved him in a controversy with Augustine. He ultimately modified his opinions so far as to adopt the system to which theologians have given the name of Semi-pelagianism, holding that man, since the fall, is not absolutely incapable of good, but, on the contrary, both derives from nature the seeds of virtue, and is able of himself to commence their primary development, though he requires the aid of divine grace to bring them to maturity. These views found great favor with the monks of France, and long maintained their ground in opposition to the efforts of Augustine and his friend Prosper of Aquitania. The best edition of the works of Cassianus is that of Frankfort (1722, fol.).

Cas'sin, John, American ornithologist: b. near Chester, Pa., 6 Sept. 1813; d. Philadelphia 10 Jan. 1869. He resided in Philadelphia from 1834, and excepting a few years partially given to mercantile pursuits, devoted himself to the study of ornithology. He contributed descriptions of new species and synoptical reviews of various families to the 'Proceedings' and the 'Journal' of the Philadelphia academy of natural science; and his more elaborate publications are 'Birds of California and Texas,' containing descriptions and colored engravings of 50 species not given by Audubon; 'Mammalogy and Ornithology of the Wikes Exploring Expedition'; 'Ornithology of the Japan Expedition'; 'Ornithology of Gilliss's Astronomical Expedition to Chile'; and the chapters on rapacious and wading birds in the 'Ornithology of the Pacific Railroad Explorations and Surveys.' His works are the result of careful research, and are especially valuable for their descriptions and classification of many birds not given in the previous works of Wilson and Audubon. According to Coues he was the only American ornithologist as familiar with the birds of the Old World as with those of America.

Cassini, Giovanni Domenico, jō vän'nē dō-mē'nē-cō käs-sē'nē, Italian astronomer: b. Perinaldo, near Nice, 8 June 1625; d. Paris 14 Sept. 1712. He studied at Genoa with the Jesuits. Chance turned his attention to astronomy, in which he made such rapid progress that

in 1650 the senate of Bologna bestowed on him the first professorship of astronomy at the university. A meridian had been drawn by Ignatio Dante (1575) in the church of St. Petronia in that city. In 1653 Cassini conceived the idea of extending and correcting it. In two years he completed this difficult task, the first-fruits of which were more correct tables of the sun, a more precise determination of its parallax, and an excellent table of refractions. By an observation at Città della Piave he discovered the shadows cast by the satellites of Jupiter on the disk of that planet when they are between it and the sun. By means of these he corrected his theory of the motion of the satellites, and determined the period of Jupiter's revolution. In 1668 he published his 'Ephemerides of the Satellites of Jupiter.' In 1673 he settled in France. He discovered four new satellites of Saturn and the zodiacal light, proved that the axis of the moon is not perpendicular to the plane of the ecliptic, and showed the causes of her libration. The laws of this motion are one of his finest discoveries. He also wrote observations on the Indian calendar. The meridian commenced by Picard and Lahire was continued by Cassini in 1700 to the extreme limits of Roussillon, and when measured 100 years later showed a difference of only 21 toises (about 134 feet). He lost his sight some years before his death. His 'Opera Astronomica' was published at Rome in 1666.

Cassini, Jacques, zhäk, French astronomer: b. Paris 18 Feb. 1677; d. Thury, department of Oisi, 16 April 1756. He was the son of Giovanni Domenico and succeeded him in his post at the Paris observatory. In 1694 he was admitted into the Academy of Sciences. His labors to determine the figure of the earth are well known. The first measurement of 1718 made the degrees of the meridian shorter toward the north than toward the south, whence it was concluded that the earth was an oblong spheroid. Cassini continued the measurement, and maintained this opinion in his work 'De la Grandeur et de la Figure de la Terre.' In order to settle the question the Academy was commissioned in 1733 to measure the whole length of France from Brest to Strasburg. Cassini directed this undertaking, but was led into some errors by the defective instruments of former observers. The astronomical tables which he compiled were published at Paris in 1740. He wrote a great work on the inclinations of the orbits of Saturn's satellites and ring. In addition to his astronomical works, he wrote several essays on subjects in natural philosophy, etc.

Cassini, Jacques Dominique, zhäk dō-mē-nēk, COUNT DE, French astronomer: b. Paris 30 June 1748; d. Paris (?) 18 Oct. 1845. He was the son of Cassini de Thury and succeeded his father in 1784 as director of the Paris observatory. He was a member of the Academy, and a statesman of ability as well as a mathematician. In 1789 he completed the topographical work which was begun by his father. The 'Atlas National' was a reduction of it on a scale of one third. Cassini was arrested by order of the revolutionary tribunal. He escaped with life, but lost the copper-plates of the 'Carte de France,' which had cost 500,000 francs. Napoleon made him a count of the empire.

Cassini de Thury, de tü-rē, **César François,** sā-zär fräṅ-swä, French astronomer: b. Paris 17 June 1714; d. 4 Sept. 1784; son of Jacques Cassini. He was a member of the Academy from his 22d year, and director of the observatory in 1756. He undertook a geometrical survey of the whole of France. When the support of the government was withdrawn in 1756, Cassini formed a society for advancing the requisite sums, which were to be repaid by the sale of the maps constructed from the survey. The work was almost entirely finished when he died.

Cassinian, or **Cassian Oval,** a special cartesian oval. It is the locus of a point the product of whose distances from two fixed points is constant. It varies in shape as the constant product and the distance between the fixed points are differently chosen, and may break up into two separate, but symmetrical figures. Another special form is that of Bernouilli's lemniscate.

Cassino, a game at cards usually played by four persons (although more can enter the game), two on each side. In it the ten of diamonds, technically called big cassino, counts two; and little cassino, the two of spades, counts one. The points possible to be scored in one deal (exclusive of sweeps) number 9. They are: Big cassino, 2; little cassino, 1; cards, 1; spades, 1; each ace, 1 = 4. A sweep is counted when a player takes up all the cards on the table. The object sought in the game (besides the points already enumerated) is to arrange the cards on the board in combination so that the sum of the spots on the cards thus combined may equal those on one card in the hand of the player, who has the right to take as many cards from the board as he can thus combine; or he may capture any card from the board the counterpart of which he has in hand.

Cassiodo'rus, Magnus Aurelius, Roman historian and statesman, who lived from about 468 to 568. He entered the service of the Ostrogoth king of Italy, Odoacer, at the age of about 20 years and under him and his successor Theodoric was treasurer of the kingdom and trusted councilor, administering his office with extraordinary prudence in a most difficult time. As statesman, scholar, and historian he kept alive the lamp of the Græco-Roman learning after the overwhelming of the ancient civilization by the barbarians. After a term of 50 years in public station he withdrew to a monastic institution founded by himself in his native province Bruttium and there spent the remaining 30 years of his useful life, imbuing his monks with a love of the ancient learning and employing them in copying the ancient texts of profane no less than of religious writings. He may be regarded as the father of the monastic *Scriptorium* to which modern learning is indebted for great part of what has come down to us of the ancient literature and of the history of the west in those troublous times. He composed manuals of rhetoric and grammar which were used as text-books in the schools of the Middle Ages till the revival of the ancient learning, and which inspired men with a longing for the ancient knowledge. Of great service also were his works 'De Artibus ac Disciplinis Liberalium Literarum' (of the liberal arts and courses of study), and his 'De Institutione Divinarum Literarum' (instruction in scriptural know-

ledge); but above all his 12 books of 'Epistolæ Variæ' (various letters), containing decrees of the Ostrogothic kings, upon which is based the whole history of Italy under the rule of those barbarian potentates: this collection was first printed at Augsburg 1533. With one Epiphanius he made a compendious Latin version, entitled 'Tripartita Historia' (tripartite history) of the history of the Church as written by the three Greek historians, Socrates, Sozomen, and Theodoret, and continued Socrates' history to the year 518. An edition of his complete works was printed at Rouen in 1679 and at Venice in 1729. His 'Life' was written by the eminent Benedictine, Sainte Marthe, and published in Paris in 1694.

Cassiopeia, kăs-ĭ-ō-pē'ya, in Greek mythology, daughter of Arabus and wife of Cepheus, to whom she bore Andromeda. She dared to compare her daughter's beauty to that of the Nereids, who, enraged thereat, besought Poseidon for vengeance. The god, in compliance with the request of the water-nymphs, laid waste the dominions of Cepheus by means of a deluge and a dreadful sea-monster.

In astronomy Cassiopeia is a conspicuous constellation in the northern hemisphere, situated next to Cepheus. In 1572 a new and brilliant star appeared in it, which, however, after a short time, gradually diminished, and at last disappeared entirely. The constellation Cassiopeia contains 55 stars, five of which, arranged in the form of a W, are of the third magnitude.

Cassiquiari, kăs-sē-kē-ä'rē, or **Cassiquiare,** a deep rapid river of South America, in Venezuela, branching off from the Orinoco, and forming a water-way by which that river has navigable communication with the Rio Negro. It leaves the Orinoco in lat. 3° 10′ N.; lon. 66° 20′ W., about 20 miles west of Esmeralda, and, after a southwest course of 128 miles, falls into the Rio Negro near San Carlos, in lat. 2° 5′ N.; lon. 67° 40′ W. It is estimated to carry off about a third of the water of the Orinoco, being 100 yards broad where it leaves that river, and about 600 yards at its junction with the Rio Negro. By means of this river, the Rio Negro, the Amazon and its tributaries, it is practicable to sail from the interior of Brazil to the mouth of the Orinoco.

Cassiterides, kăs-sĭ-tĕr'ĭ-dēz, a name derived from the Greek *kassiteros,* tin, and anciently applied, but with no uniformity or precision, to the tin district of Cornwall, to the Scilly Isles, or to small islands off the northwest coast of Spain.

Cassit'erite, native dioxide of tin, SnO_2, crystallizing in the tetragonal system, and also occurring uniform and in rolled grains. The crystals are usually brown or black, brittle with an uneven fracture, and with a specific gravity of from 6.8 to 7.1, and a hardness of from 6 to 7. Ordinary massive or crystallized cassiterite is often called "tinstone," especially in England; "wood tin" is a botryoidal form, "stream tin" is the mineral in small rolled pebbles found in the streams or placer deposits and is formed by the disintegration of stanniferous rocks. Cassiterite is the most important ore of tin. It occurs in Cornwall (England), Saxony, Bohemia, Galicia, Greenland, Sweden, and in Australia, the Malay Peninsula, Banca, Bolivia, and Mexico. In the United States it is found in small amounts in various States, and it has been mined to some extent in Virginia and in South Dakota. A promising deposit has recently been reported from San Bernardino County, Cal., where mining operations have been carried on for some time with apparent success.

Cassius, kăsh'ŭs, **Andreas,** Dutch physician who flourished during the 17th century. He graduated at Leyden in 1632, was physician to the Duke of Holstein and Bishop of Lübeck, and died at Hamburg in 1673. His name is best known in connection with a purple color obtained from gold, which was briefly described in a treatise published by his son in 1685.

Cassius Longi'nus, Caius, the friend of Brutus, was the quæstor of Crassus, and preserved the few troops of that general who escaped from the bloody battle with the Parthians. With these he defended Syria against the Parthians till the arrival of Bibulus. In the famous civil war that broke out between Pompey and Cæsar he espoused the cause of the former, and, as commander of his naval forces, rendered him important services. When Cæsar, after the victory of Pharsalia, was in pursuit of Pompey, he advanced with a few vessels, while crossing the Hellespont, against a fleet of 70 sail commanded by Cassius, and called upon him to surrender. The latter, astonished by his daring courage, surrendered at his summons. Cæsar pardoned him, and afterward bestowed various honors on him; but Cassius, who had always cherished feelings of bitter hatred toward Cæsar, joined in the conspiracy against him, and, with the aid of several fellow-conspirators, assassinated him, 44 B.C. He then, together with Brutus, raised an army to maintain the cause of their faction. They were met by Octavianus and Antony, who professed themselves the avengers of Cæsar, at Philippi. The wing which Cassius commanded being defeated, he imagined that all was lost, and killed himself, 42 B.C. See BRUTUS; CÆSAR.

Cassius, Purple of. See PURPLE OF CASSIUS.

Cassivellaunus, kăs-ĭ-vĕ-lô'nŭs (in Shakespeare's 'Cymbeline,' CASSIBELAN), a noble and warlike British chief of the Catuvellauni, who, when Cæsar invaded Britain in 54 B.C., held sway over several tribes living to the north of the Thames, and led the resistance to the advance of the Roman general. Having advanced to the Thames, Cæsar found the Britons under Cassivellaunus posted on the north bank of the river prepared to dispute his passage. He crossed, however, without much difficulty, but the British charioteers persistently harassed his line of march. The Trinobantes, a tribe of Essex and Middlesex, soon sent in their submission to Cæsar, and as their example was followed by others, Cassivellaunus found himself unable to oppose resistance to the Romans. His stronghold, which contained many cattle, was captured by Cæsar; and an attempt made to storm Cæsar's naval camp proving unsuccessful, Cassivellaunus sued for peace, gave hostages, and promised an annual tribute.

Cassock, a name formerly applied to a long loose gown worn over the other garments, in which sense the word is found in Shakespeare. It is now applied to a tight-fitting coat worn under the gown or surplice by the clergy.

The cassock is generally black; but in the Catholic Church only the ordinary priests wear black cassocks, those of bishops being purple, of cardinals scarlet, and that of the Pope white.

Cas'sowary, a corruption of a Malayan name for birds of the family *Casuariidæ* belonging to the *Ratitæ,* their affinities being greatest with the emu. The shortness of their wings totally unfits them for flight. As in others of this group, the pectoral or wing muscles are comparatively slight and weak, while those of their posterior limbs are very robust and powerful. The wings of the ostrich are of some assistance to it in running, but those of the cassowary are too short to be of service in this way, and with the exception of the ends of the five stiff quills are completely hidden beneath the plumage. The cassowaries have three toes, all provided with nails, of which the inner one is much elongated.

The cassowaries constitute a single genus (*Casuarius*) all the species of which have a long compressed bill, a cancellated bony crest or helmet on the head, and stiff barbless quills on the wings. Several species are known, and of these one of the most familiar is the helmeted cassowary of Ceram (*C. galeatus*), which has the head surmounted by an osseous prominence covered with a sort of horny helmet; the skin of the head and superior part of the neck is naked, of a deep-blue and fiery-red tint, with pendent caruncles or wattles. The naked rigid quills on the wings are used as weapons of defense, but the cassowary is rather timorous and shy. It is about 5½ feet long from the tip of the bill to the extremity of the longest claw. The head and neck together measure 18 inches; the largest toe, including the claw, is 5 inches; and the claw of the inner toe is 3½ inches long.

All the feathers of the cassowary, which have a peculiar structure, are of the same kind, contour feathers serving only for covering, and externally are all of one color. In this genus the aftershaft is as long as the shaft and both are filamentous. The double feathers are of unequal length, some on the rump being 12 or 14 inches long, while others are only 3. The stem or shaft is flat, shining, black, and knotted below, having a beard arising from each knot. The helmet is black in front and yellow behind. The eye is of a bright yellow, and more than an inch in diameter.

The anatomy of the cassowary differs very materially from that of the ostrich, which it resembles so much in general appearance. The intestines are short, and the cæcum small; there is no stomach intermediate to the crop and gizzard, and the cloaca is not larger in proportion than that of other birds. It feeds on fruits, eggs of birds, etc., and inhabits the forest districts.

As might be inferred from its structure, the cassowary is a swift runner, and its mode of progression, being unaided by wings, is as peculiar as it is efficient. In running, the cassowary appears to strike out powerfully with one leg, so as to project its body violently forward with a bounding motion, far surpassing the speed of a horse. It also kicks violently when, in a state of captivity, it is provoked to anger, and can inflict a very severe blow. The eggs of the galeated cassowary are green, and are neither so round nor so large as those of the ostrich. The shell is marked by numerous little deep-green tubercles. The largest of their eggs measure about 15 inches in length and 12 round. Eight species, with a number of local races, are known, distributed with New Guinea as a centre to this and surrounding islands and the adjacent parks of Australia. See also EMU; OSTRICH.

Consult Rothschild, 'Transactions of the Zoological Society,' London, 1901; Mosenthal & Harting, 'Ostriches and Ostrich-Farming.'

Cassowary-tree. See CASUARINA.

Cast, in the fine arts, is an impression taken by means of wax or plaster of Paris from a statue, bust, bas-relief, or any other model, animate or inanimate. In taking a cast from a living person's face, it is necessary, first, to anoint the eyebrows and eyelashes, and any hairs about the cheeks and temples, with a little sweet-oil; then to insert two tubes (oiled also) of pasteboard into the nostrils, so that breathing may be performed through them; a handkerchief is then to be tied loosely over the face, and the head sloped backward in an elbow chair or sofa. Powdered and calcined plaster of Paris is then mixed with spring water to the consistence of cream, and poured in between the face and handkerchief to the depth of half an inch. On becoming fixed or hard, it is removed and left to dry. When dried thoroughly it is well soaked with linseed-oil, and an impression may then be taken from it, in plaster of Paris or soft clay; the hollow cast being first split longitudinally down the nose, so that the object cast may be more easily removed.

It ought to be observed that all models should be divided into several pieces or joints; thus, in that covering any round body, one side must be covered first with the plaster, and the sides pared with a knife, and smeared with clay and water, then the remaining part of the object covered with plaster, and a joint will thus be formed between the two parts; for, wherever the mixture of clay and water has been applied with a hair brush, the cast will not adhere, and therefore will be easily separated with the blunt edge of a knife. It is usual also to make small pits or depressions of the size of small buttons, on the edges of the joints of molds, so that they may lock together well when added, and thus fit closely.

Plaster casts are varnished by a mixture of soap and white wax in boiling water. A quarter of an ounce of soap is dissolved in a pint of water, and an equal quantity of wax afterward incorporated. The cast is dipped in this liquid, and after drying a week is polished by rubbing with soft linen. The surface produced in this manner approaches to the polish of marble. When plaster casts are to be exposed to the weather, their durability is greatly increased by saturating them with linseed-oil, with which wax or rosin may be combined. When intended to resemble bronze, a soap is used made of linseed-oil and soda, colored by the sulphates of copper and iron. Walls and ceilings are rendered waterproof in the same way.

Cast, or **Casting-line,** a gut line used in angling, from two to four yards in length, having artificial flies attached to it at intervals of about two feet.

Cast Iron, iron obtained from the blast-furnace by running the fused metal into molds prepared for the purpose. The molds are in

the form of long, narrow channels, from which the iron, when it has cooled and solidified, is taken in bars called "pigs," between three and four feet long, and three or four inches broad. See IRON.

Cast Steel, blister steel which has been broken up, fused in a crucible, cast into ingots, and rolled. The blocks of steel are melted in crucibles of refractory clay, and the molten metal is poured into ingot-molds of cast iron. These are opened to let out the red-hot ingot, which is then passed to the rolls. The process of making cast steel was invented by Benjamin Huntsman, of Attercliff, near Sheffield, in 1770. See STEEL MANUFACTURE.

Castagno, Andrea del, än-drā'ä dĕl käs-tän'yō, Italian painter: b. Castagno, Tuscany, about the end of the 14th or beginning of the 15th century; d. 1480. Being early deprived of his parents, who were extremely poor, he was employed by his uncle to tend cattle in the fields, and in that situation, by his surprising and untutored essays in the art, attracted the notice of Bernardetto de Medici, who placed him under the tuition of one of the best masters Florence then afforded. At first he painted only in distemper and fresco, and was in high repute when Florence was visited by Domenico Venetiano, who had learned from Antonello da Messina the new method of painting in oil and varnish, till then unknown in Tuscany. The splendor of this mode of coloring was much admired, and by a pretended friendship for Domenico, Castagno obtained his secret; but not satisfied with this he desired to be the sole possessor, and determined to murder his friend and benefactor. This he effected without any suspicion, and continued to practise his ill-acquired art with great success. The real author of this atrocious act was never discovered until Andrea made a full confession of his guilt shortly before his death. The best of his remaining works are at Florence, in the church of St. Lucia de Magnuoli, and in the monastery Degli Angeli. The latter contains a crucifixion by him painted on a wall.

Castaigne, André, än-drā käs-tän, French artist: b. Angoulême 1861. He studied at the Suisse Academy and at the École des Beaux Arts in Paris; he exhibited at the Paris Salon in 1884 and several times in later years. Among his pictures are 'Dante and Beatrice'; 'The Deluge'; 'Portrait of Vicomte de Dampierre'; and 'After the Combat' (in the Peabody Gallery at Baltimore). In 1890 he came to the United States and remained here until 1895. He was director of an art school in Baltimore and in 1891 began the illustrating work by which he is best known to the American public. His first work of this character was 'The Forty Niners' Ball' in the 'Century Magazine' for May 1891; since then he has illustrated for several of the leading magazines; his designs include the pictures of the Texas cowboys in 'Scribner's Magazine' and the World's Fair drawings and illustrations for 'Polly' in the 'Century.' On his return to France he became instructor in the Colarossi Academy and opened a studio in Paris. See 'The Critic' Vol. XXIII., 57; 'The Bookbuyer' XII., 506.

Casta'lia, a celebrated fountain in Greece, the sacred spring of the Delphic oracle, at which all the pilgrims to Apollo's shrine were obliged to purify themselves. It issues from a fissure between two peaked cliffs, which form the summit of a semicircular range of rocks, anciently called the Phædriades. These immediately adjoin Mount Parnassus, and rise to the height of 2,000 feet. The Castalian spring was said to impart poetic inspiration to those who drank of it, but it was only latterly by the Roman poets that it was invested with this tribute. It is now called the Fountain of St. John, from a small chapel dedicated to St. John which stands near its source.

Castalides, käs-tăl'ĭ-dēz, the Muses, so called from the fountain Castalia, at the foot of Parnassus.

Castalio, Sébastien, sā-bäs-tē-ŏn käs-tăl-yō, French theologian: b. Dauphiny 1515; d. Basel 20 Dec. 1563. His original name was Châteillon. Through the influence of Calvin he was made professor of classical literature at Geneva. Having quarreled with the reformer, who caused his banishment in 1544, he repaired to Basel, where he taught the Greek language; but as his stipend did not suffice to support his numerous family, he was compelled to employ part of his time in agricultural labors. He made a Latin translation of the Bible, the best edition of which is in folio, Basel, 1573. He defended the right of free discussion in a collection of maxims compiled from various sources.

Casta'nea, a trade name for the Brazilnut and the genuine name for the chestnut (qq.v.).

Cas'tanets, small wooden rattles, made in the shape of two bowls or cups, fitted together and tied by a string, and then fastened to the thumbs. The fingers being rapidly struck upon them, a tremulous sound is produced, which marks exactly the measure of the dance. Something similar to this was the *krotalon* of the ancients, who also made use of small cymbals in their dances and festivals in honor of Bacchus. It is probable, however, that they had their origin in the East, and were brought by the Moors into Spain. Here, too, they received their name *castañuelas,* from being commonly made of the wood of the chestnut (*castaño*), or from their color. They are still in use in Spain, and here and there in the south of France. The charm of variety has also procured for them a place in ballets and operas.

Castanheda, Fernao Lopez de, fĕr-nā'o lō'-pāth dā käs-tän-yā'dä, Portuguese historian: b. Santarem about 1500; d. Coimbra 23 March 1559. His father having been appointed to an important post in India, he was taken thither in youth, and was thus led to make the careful and unremitting researches embodied in the 'History of the Discovery and Conquest of India by the Portuguese' (1551–61), a work upon which Camoens drew largely in the course of his epic activity.

Castaños, Don Francisco Xavier de, frän-thēs'kō HÄ-vē-ār' dā käs-tā'ñōs, Duke of Baylen, Spanish military officer: b. Madrid 22 April 1756; d. Madrid 24 Sept. 1852. Educated in military science in Germany, on the invasion of the country by Napoleon, he received the command of a division of the Spanish army, and in July 1808 compelled 18,000 French, under Gen. Dupont de l'Etang, to surrender at Baylen, but was in turn defeated by

Lannes in November of the same year at Tudela. Under Wellington he served as general of the 4th Spanish *corps d'armée*, and took part in the battles of Albuera, Salamanca, and Vittoria. In 1815 he was placed at the head of the Spanish army for the invasion of France, which was rendered unnecessary by the victory at Waterloo. In 1825 he was called to the State Council, where he became a decided opponent of the Carlist party.

Caste, a social class whose burdens and privileges are hereditary. The word is from the Portuguese *casta,* race, and was applied by the Portuguese, who became familiar with Hindustan, to the classes in India whose occupations, privileges, and duties are hereditary. This term is sometimes applied to the hereditary classes in Europe; and we speak of the spirit or the prerogatives and usurpations of a caste, to express particularly that peculiar constitution of society which makes distinction dependent on the accidents of birth or fortune. The division into castes, where it appears in its most typical form, comes to us from a period to which the light of history does not extend; hence its origin cannot be clearly traced: but it is highly probable that wherever it exists it was originally grounded on a difference of descent and in modes of living, and that the separate castes were originally separate races of people. This institution has been found among many nations. According to the accounts collected by Clavigero, some traces of it were apparent among the Peruvians and Mexicans; but it prevails principally in the East, where it has existed from the earliest times, and has become blended with the political condition of the people. The division into castes was entirely interwoven in the whole fabric of civil society, in ancient Egypt and India. In Egypt this division was perfected as a political institution in the flourishing period of the Pharoahs; and the lines of separation which had been drawn in earlier times by a difference of descent and different modes of living were then rendered still more distinct. The number of castes in that country is variously stated by Herodotus, Plato, Diodorus, and Strabo. The institution of caste, however, is best known to us as it exists in Hindustan, where it is well known to have existed since perhaps 1,500 or 2,000 years before the Christian era. The great Indian castes are four in number, namely, the Brahmans or sacerdotal class; the Kshatriyas or military class; the Vaisyas or mercantile class; and the Sudras or servile class. The three castes first named are regarded as being altogether of a higher character than the fourth, rejoicing in the peculiar religious distinction of being "twice-born" as contrasted with the "once-born" Sudras. This distinction is undoubtedly ethnical in its origin, the twice-born castes being descendants of the Aryan invaders and conquerors of the country, while the once-born are the representatives of the conquered. Caste, however, is a much more complicated thing than would be supposed from this brief statement, since the principle of caste classification according to employment as well as to race has long prevailed, and from early times there has been an intricate mingling of castes. The Brahmans are the sacerdotal caste, but, according to Sir W. W. Hunter ('The Indian Empire,' 2d edition, 1893), "Even among the Brahmans, whose pride of race and continuity of tradition should render them the firmest ethnical unit among the Indian castes, classification by employment and by geographical situation, plays a very important part; and the Brahmans, so far from being a compact unit, are made up of several hundred castes, who cannot inter-marry nor eat food cooked by each other. . . . In many parts of India, Brahmans may be found earning their livelihood as porters, shepherds, cultivators, potters, and fishermen, side by side with others who would rather starve, and see their wives and little ones die of hunger, than demean themselves to manual labor, or allow food prepared by a man of inferior caste to pass their lips." Altogether some 1,886 separate Brahmanical tribes have been enumerated, and the Kshatriyas or Rajputs now number 590 tribes in different parts of India. "In many outlying provinces we see non-Aryan chiefs and warlike tribes turn into Aryan Rájputs before our eyes. Well-known legends have been handed down of large bodies of aliens being incorporated from time to time even into the Brahman caste." While there has been a tendency in the different provinces for every separate employment to develop into a distinct caste, there are also instances of castes changing their employment and raising themselves in the social scale. Thus the Vaisyas, who were anciently that Aryan caste upon whom the tillage of the soil fell, have become the merchants and bankers of India, leaving to the Sudras and mixed castes the labor of cultivation. "Each caste is to some extent a trade-guild, a mutual assurance society, and a religious sect. As a trade union it insists on the proper training of the youth of its craft, regulates the wages of its members, deals with trade delinquents, supplies courts of arbitration, and promotes good fellowship by social gatherings. . . . The caste or guild exercises a surveillance over each of its members, from the close of childhood until death. If a man behaves well he will rise to an honored place in his caste; and the desire for such local distinctions exercises an important influence in the life of a Hindu. But the caste has its punishments as well as its rewards. The fine usually takes the form of a compulsory feast to the male members of the caste. This is the ordinary means of purification or of making amends for breaches of the caste code." A person who has become an "out-caste," or lost his caste position and privileges, may generally recover them in this way.

Castel Nuovo, käs'tĕl nwō'vō, or **Novo,** Austria, a town and commune of Dalmatia, in the circle of Cattaro. It stands near the entrance to the Gulf of Cattaro, and is surrounded by walls which have suffered much from repeated sieges and earthquakes. It contains two churches, a Roman Catholic and a Greek; a lazaretto, and custom-house. The chief manufacture is in articles of brass. The country around is beautiful and fertile. The population of the town is small, but that of the commune is about 10,000, most of whom belong to the Greek Church.

Castel Vetrano, käs'tĕl vā-trā'nō, Sicily, a town in the province and 27 miles southeast of Trapani, on a rocky hill. It lies in a fertile district, is regularly built, has several churches, grammar school, with municipal museum, etc. The white wine produced in the neighborhood

is esteemed the best in Sicily. Articles of coral and alabaster are manufactured here. Pop. (estimated) 25,000.

Castelar, käs tā lär, **Emilio,** Spanish statesman: b. Cadiz 8 Sept. 1832; d. Murcia 25 May 1899. He studied at Madrid, and in 1856 became professor of history and philosophy in the university there. He began early to write on letters and politics in the newspapers and magazines, and in 1864 started *La Democracia* (*The Democrat*), in the pages of which he inveighed fiercely against the government. After the abortive rising of 1866 he was condemned to death, but contrived to escape to Paris, returning when the revolution of 1868 began. All his ardor and eloquence could not hinder the crowning of King Amadeus, though it helped to bring about his downfall in 1873. In September of that year the Cortes made Castelár dictator, but the orator proved somewhat ineffectual in action, and found himself unable to crush either the "red demagogy of Socialism on the one hand, or the white demagogy of Carlism" on the other. In the beginning of 1874 a hostile vote in the Cortes obliged him to resign, and soon after the *pronunciamiento* in favor of Alfonso XII. drove him across the frontier. He returned to Spain in 1876, and was returned to the Cortes, where, till his retirement in 1893, he often spoke with all his old eloquence. His chief writings are: 'Civilization' (2d ed. 1865); 'Questions, Political and Social' (3 vols. 1870); 'Parliamentary Discussion' (3 vols. 1871); 'History of the Republican Movement in Europe' (2 vols. 1874); 'The Oriental Question' (1876).

Castelein, Matthiis de, mä-tē'īs dė käs'tē-līn, Dutch poet: b. Pamele (Oudenarde) 1485; d. 1550. He was the acknowledged lawgiver and pattern of all the Dutch rhetoricians of his time, in his 'Art of Rhetoric.' He composed many plays, but only two of them were published; one of these is the 'Story of Pyramus and Thisbe.' He wrote also 'Ballads' and a volume of 'Various Lays,' in melodious verse.

Castellamare, käs-tėl-lā-mä'rē, or **Castellammare,** Italy, a seaport town on the Gulf of Naples, 17 miles southeast of the city, at the beginning of the peninsula of Sorrento, and 10 miles northeast of that town. It extends for a mile along the shore at the base and on the slope of a spur of Monte Sant' Angelo (4,735 feet high), a mountain which commands a splendid prospect. From its pleasant surroundings, shady walks, sea baths, and other attractions, it is a favorite summer resort of the Neapolitans, as well as tourists, and has several good hotels, one of them formerly a royal residence. The harbor is protected by a mole, and there is an arsenal with a dockyard. The town owes its name to a castle built by the Emperor Frederick II. in the 13th century. Castellamare occupies the site of the ancient Stabiæ, overwhelmed, with Herculaneum and Pompeii, by an eruption of Vesuvius, 79 A.D.; and it was here that the elder Pliny met his death by approaching too near to the mountain when in a state of eruption. The modern town was afterward built from the ruins of Stabiæ. Pop. about 33,000.

Cas'tellan, or **Chatelain,** properly the owner or commander of a castle. In Flanders and France the title went with the possession of certain districts, and in Normandy and Burgundy châtelains ranked next after bailiffs, with both civil and military authority. In Germany the châtelains were imperial officers with military and civil jurisdiction in fortified places.

Castellane, Esprit Victor Elizabeth Boniface, ĕs-prē vēk-tōr ā-lē-zā-bĕt bŏn-ī-fās, COUNT OF, French marshal: b. Lyons 1788; d. 1862. He entered the army in 1804, and took part in most of Napoleon's campaigns. After the restoration he became colonel of the Hussars of the Royal Guard. He fought in Spain (1823), and at the siege of Antwerp (1832), and as lieutenant-general commanded the Army of the Pyrenees. In the February revolution (1848), he lost his command, and in consequence went over to Louis Napoleon. In 1850 he became commander at Lyons, and in 1852 marshal and senator. His 'Memoirs,' published in 1896, though crude in style, are valuable for their mass of minute detail.

Castelli, Benedetto, bā nā dĕt'tō käs-tĕl'lē, a pupil of Galileo: b. Brescia 1577; d. 1644. He was a monk and became abbot of a Benedictine monastery of the congregation of Monte Cassino. He afterward became a professor of mathematics, and taught with distinguished success both at the University of Pisa and at the Collegio della Sapienza at Rome. Torricelli was his pupil. He distinguished himself in hydraulics, and rendered important services to Urban VIII. in his projects for the regulation of Italian rivers. He may be regarded as the founder of that branch of hydraulics which relates to the velocity of running water, though his fundamental principle, that the velocity is proportional to the height of the reservoir, is inaccurate, and was demonstrated to be so by Torricelli, who showed that the velocity is proportioned, not to the height, but to the square root of the height. In his investigations as to the measurement of time Castelli made use of the pendulum. His principal work, entitled 'Della Misura dell' Acque Correnti,' published at Rome in 1628, was translated into French in 1664.

Castelli, Ignaz Franz, Austrian dramatist: b. Vienna 6 May 1781; d. there 5 Feb. 1862. He was educated for the law, but following his inclination for the drama, gained access to the orchestras of theatres as a player of the violin. His circumstances compelling him to look out for some means of support, he accepted various subordinate offices, but using his leisure in composing patriotic songs for the Austrian army, he was brought into favorable notice. His songs having given umbrage to Napoleon, he fled to Hungary. In 1815 he accompanied Count Cavriani as secretary to Paris, and afterward he served in the same capacity with Baron Münch von Bellinghausen in Upper Italy. In 1840 he retired with a pension and the office of state librarian. The author of many poems, popular songs, and miscellaneous writings, he was at various times connected with the press of Vienna, but is best known by his voluminous productions for the stage. Over 100 plays, partly adapted from the French, partly original, are attributed to him. In 1848, more than 100,000 copies of his political pamphlets in favor of the Revolution found eager purchasers.

Castellio, käs-tĕl-lī-ō, **Sebastianus,** French theologian and humanist, translator of the Bible into pure and classic Latin; he was a native of

Dauphiny: b. 1515; d. Basel 1563, in exile and in extreme poverty. His family name was Châteillon, which he latinized after the fashion of that time into Castellio. At the invitation of Calvin he settled at Geneva, where he became professor of the ancient classic literatures, but because of differences regarding questions of religious belief he was deposed from the professorship and banished from Geneva. His Latin version of the Bible retained little or nothing of the profoundly Hebrew character of the scriptural writings, and was justly censured by Calvin and the Calvinists. Theodore Beza, to offset this "work of Satan," as he called it, made a Latin translation of the Bible himself, striving to retain the Oriental flavor of the original in every respect. Castellio also wrote a book in defense of the right to hold and publish views deemed by Church and state to be heretical; this, too, evoked a reply from Beza. Castellio wrote also a tractate on 'Predestination Opposed to the Views of Calvin'; it was published after the author's death by Faustus Socinus in 1578.

Castello, käs-tĕl'lō, **Gabriel Lancelot,** Italian antiquary: b. Palermo 1727; d. 1794. He was descended from a noble family, and was placed under a private tutor with a view to study botany, chemistry, etc.; but accidentally meeting with some old coins which had been dug up by a plowman, he was seized with a great desire to decipher them, and from that time devoted himself to antiquarian pursuits. He formed a splendid collection of the remains of antiquity found in Sicily, and his museum was always open to foreigners as well as to natives. On his death-bed he bequeathed a large quantity of books, etc., to the public library of Palermo. At his death he was honorary member of the Royal Society and of the Academy at Paris. He published several works.

Castello-Branco, Camillo, kä-mēl'lō käs-tĕl'lō brän'kō, Portuguese novelist and poet: b. Lisbon 16 March 1826; d. 6 June 1890. He is the most popular of the modern romancists of Portugal, and at the same time the most national in tone, spirit, and form. Realism characterizes his numerous novels (over 100), the best known being: 'Love of Perdition' (1862); 'The Marquis of Torres Novas'; 'Brilliants from Brazil.' All of them are genuine pictures of Portuguese life. Among his poetic compositions, the collection published under the title, 'A Book' (1854), holds the first place.

Castellon, Francisco, frän-chĕs'kō käs-tĕl-yōn', Nicaraguan revolutionist: b. about 1815; d. 2 Sept. 1855. He was the leader in a revolt at Leon in 1853, which was unsuccessful, and fled to Honduras, whence he returned in June of the next year. It was by his invitation that the filibustering expedition under William Walker went from the United States in 1854.

Castellon de la Plana, dā la plä'nä, Spain, capital of the province of Castellon, 40 miles north-northeast of Valencia. It stands in a large and fertile plain, watered by the Mijares, from which an ample supply of water is brought into the town by an aqueduct supposed to have been constructed by Jayme I. of Aragon, who, in 1233, wrested Castellon from the Moors. It is well built, and has considerable manufactures of sailcloth, and woolen and hempen fabrics, ropes, paper, soap, etc., and some trade in hemp, grain, and fruit. The painters Ribalta, father and son, were born here. Pop. of town 31,272; of province, 304,477.

Castelnau, käs-tĕl-now, **Francis** (COMTE), French traveler: b. London 1812; d. Melbourne, Victoria, 4 Feb. 1880. He traveled extensively in Canada, the United States, and Mexico, and under the protection of the French government undertook an exploration of South America in 1843, accompanied by D'Osery, a botanist; Weddell, a botanist; and Deville, a taxidermist. After his return to France, in 1847, Count Castelnau published 'Expedition dans les parties centrales de l'Amerique du Sud' (1850–1), a work in six volumes, of which one was by M. Weddell. Castelnau afterward traveled in Arabia, and was successively consul at Bahia, the Cape of Good Hope, and Singapore, and at the time of his death was consul-general at Melbourne.

Castelnaudary, käs-tĕl-nō-dä-rē, France, a town in the department of Aude, on a height above the Canal du Midi, 22 miles west-northwest of Carcassonne. It was built by the Visigoths on the site of a rich town which had been destroyed, and was named Castellum Novum Arianorum, from which its present name is corrupted. It rises in the form of an amphitheatre, and was anciently the capital of a district, and strongly fortified. It was the scene of much barbarity by the inquisitors in 1237, was almost totally destroyed by Edward the Black Prince in 1355, and is famous for the battle fought beneath its walls in 1632 between the troops of Louis XIII. and those of Gaston of Orleans, which resulted in favor of Louis chiefly in consequence of the inactivity of the Duke of Orleans. The Duke of Montmorency was wounded in this battle and taken prisoner, and afterward executed at Toulouse by order of the king, Louis XIII. It is indifferently built, but has manufactures of coarse cloth, several distilleries and tanneries, and one of the largest grain and flour markets in the south of France. Pop. about 10,000.

Castelnovo, Leo di, lā'ō dē käs-tĕl-nō'vō. See PULLE, LEOPOLDO, COUNT.

Castelnuovo, Enrico, ĕn-rē'cō käs-tĕl nwō vō, Italian novelist: b. Florence 1839. His stories have attained great popularity; among them: 'Prof. Romualdo' (1878); 'Two Conventions' (1885); 'Reminiscences and Fancies' (1886). He is one of the acknowledged Italian masters of the "novel of the inner life" (romano intimo).

Castelvecchio, Riccardo, rē-cär'dō käs tĕl vĕk'ē-ō. See PULLE, GIULIO, COUNT.

Casti, Giambatista, jäm-bä-tēs'tä käs'tē, Italian poet: b. Prato, in the vicinity of Florence, 1721; d. 7 Feb. 1803. He studied at Montefiascone, became professor there, was appointed a canon, and made a journey to France. Receiving an invitation from the Prince of Rosenberg, who became acquainted with him in Florence, he went to Vienna, and was presented to Joseph II., who knew how to appreciate the genius of the poet, and delighted in his conversation. Casti took advantage of every opportunity of visiting other courts, and joined several embassies without office or title. Catherine II. received him in the most flattering manner. He visited also the court of Berlin, and several other German courts. After his return

to Vienna, Prince Rosenberg, the director of the Imperial Theatre, caused him to be appointed *poeta Cesareo* on the death of Metastasio. After the death of Joseph II. Casti requested his dismission, and retired to Florence, where he wrote many of his works. In 1783 he went to Paris. His 'Novelle Galanti' were republished at Paris 1804, under the title 'Novelle di Giamb. Casti,' in three volumes. They are 48 in number. Almost all are of a licentious character, but written in a lively, original, and graceful style. The same may be said of his didactic-satirical poem, 'Gli Animali Parlanti, Poema Epico di Giamb. Casti' (Milan 1802, 5 vols.). There are translations of it in French, German, and English. Casti's 'Rime Anacreontiche' are pleasing, and his comic operas, 'La Grotta di Trofonio' and 'Il Re Teodoro in Venezia,' etc., are full of wit and originality.

Castiglione, Baldassare, băl-dās-sä'rā käs-tēl-yō'nā, Italian writer: b. Casatico, in the territory of Mantua, 1478; d. 8 Feb. 1529. He studied at Milan, and entered into the services of the Duke Ludovico Sforza, and afterward of the Duke of Urbino, of whose elegant and splendid court he soon became an ornament. By him he was sent as an envoy to Henry VII. of England, and afterward in the same capacity to Louis XII., at Milan. In 1513 Castiglione appeared as ambassador at the court of Leo X., where he became intimate with the most distinguished literati and artists. In 1521 he obtained for the new Duke of Urbino, Federigo, the command of the Papal troops, and in 1524 was employed by Pope Clement VII. to conduct his negotiations with Charles V. When Rome was plundered by the Constable of Bourbon in 1527 he was accused of negligence, and his health was undermined by chagrin. He refused to accept the rich bishopric of Avila, which was offered to him by the emperor, until the Pope should be reconciled with Charles. Among his works, the 'Libro del Cortegiano' is the most celebrated. It teaches the art of succeeding at court. His few Italian and Latin poems are elegant. His letters are valuable contributions to political and literary history.

Castiglione, Carlo Ottavio, COUNT, Italian scholar: b. Milan 1784; d. Genoa 10 April 1849. His *magnum opus,* published in 1826, is a work in which he seeks to ascertain the origin and the history of the towns in Barbary whose names are found on Arabic coins. Out of Italy, however, he is best known by his edition of some fragments of the Mœso-Gothic translation of the Bible by Ulfilas, which had been discovered in 1817 by Cardinal Mai among the palimpsests of the Ambrosian Library.

Castiglione, Giovanni Benedetto, jō vän nē bā-nā-dĕt'tō, Italian painter: b. Genoa 1616; d. 1670. He was a pupil of Paggi, Ferrari, and Antony van Dyck, studied at Rome, Florence, Parma, and Venice, and formed his style on the best masters. He is particularly celebrated as a painter of animals, and in these subjects, as well as his other paintings, is remarkable for softness, elegance, and beauty. Of his larger pieces, the most celebrated are the 'Creation of the Beasts,' 'Their Entrance with Noah into the Ark,' and 'Jacob's Return with His Family and Servants, His Flocks, and Herds'—all in the Brignol Palace. He also distinguished himself as an engraver, and from his skill in the production of light and shade has been called the second Rembrandt.

Castiglione Del Stiviere, dĕl stēv-yā'rā, Italy, a small city in the province of Mantua, 17 miles southeast of the town of Brescia, 22 miles northwest of Mantua. It is well built, surrounded by walls, defended by an ancient castle, and contains a large square adorned with a central fountain, three churches, and a town hall. A well-attended annual fair is held in June. The French obtained here a decisive victory over the Austrians on 5 Aug. 1796, which gave to Marshal Augereau his title of Duc de Castiglione.

Castile, New. See NEW CASTILE.

Castilho, Antonio Feliciano, än-to'nē-ō fā-lē-chē-ä'nō käs-tēl'yō, Portuguese poet: b. Lisbon 26 Jan. 1800; d. 18 June 1875. Though almost blind, he studied jurisprudence at Coimbra. His first poetical composition, 'Letters of Echo and Narcissus,' published while he was a student, won him great celebrity. He excelled in pastorals; and to this class belong his 'Spring' and 'Love and Melancholy, or the Latest Heloïse.' He had a deep sympathy with nature, and was a master of elegiac verse.

Castilla, käs-tēl'yä, **Ramon,** Peruvian soldier and politician: b. Tarapaca 30 Aug. 1796; d. there 30 May 1867. He served in the Spanish cavalry until 1821, when Gen. San Martin proclaimed Peruvian independence. Castilla, then a lieutenant, joined the liberating army, in which he distinguished himself. He was elected president of Peru in 1845. At the expiration of his term of office, in 1851, he was succeeded by Gen. José Rufino Echénique, but usurped the power in 1855, and was, by a majority of 70,374 votes, re-elected to the presidency in August 1858. After being succeeded by San Roman in 1862, Castilla lived in retirement till his appointment to the presidency of the senate in 1865.

Castillejo, käs-tēl-yā'hō, **Christoval de,** Spanish poet, the last representative of the ancient Spanish poetry: b. Cindad Rodrigo about 1494; d. Vienna 12 June 1556. He opposed the introduction of Italian styles into the poetry of Spain, and justified his opposition by demonstrating in his own work the competence of the traditional styles of Spain for the expression of all moods and all sentiments. His satiric vein, especially in the 'Dialogue on the Condition of Women' and the 'Sermon on Loves,' offended both clergy and laity.

Castilloa Elastica, a lofty forest-tree, belonging to the Bread-fruits (*Artocarpaceæ*). Some specimens have near the ground a circumference of from 10 to 12 feet. The tree is native to southern Mexico and the Central American countries, and supplies the Central American rubber of commerce. This rubber, instead of being molded, as is Para rubber, is made into sheets (hence called sheet-rubber), and hung up to dry. *Castilloa elastica* has been found to be cultivable in India and Ceylon.

Castillon, käs-tē-yōn, France, a town in the department of Gironde, on the right bank of the Dordogne, 33 miles east of Bordeaux by rail. Beneath its walls, on 13 June 1453, the English met with a signal defeat, their leader, Earl Talbot of Shrewsbury, and his son, being slain. Part of the battle is described in the fourth act of Shakespeare's 'King Henry VI., Part I.'

Castine, Vincent, văñ-sŏñ kās-tēn, BARON DE, French soldier: b. Oleron 1650; d. 1722. He went to Canada in 1665, established a mercantile house at Penobscot (now the town and port of entry of Castine, Me.), in 1687, and married the daughter of the Penobscot chief. In 1696 he captured Pemaquid, at the head of 200 Indians. He assisted in the defense of Fort Royal, in 1706, and was there wounded the following year. His son, who succeeded him in command of the Penobscots, was made prisoner and taken to Boston in 1721.

Casting, the running of melted metal into a mold, so as to produce an object in metal having the shape of the mold. Iron-casting or iron-founding is carried on by three methods, the first called "open sand-casting," the second, "sand-casting between flasks," and the third, "loam-casting." In most of these an exact pattern, usually of wood, is employed by the founder. The floor of every foundry is composed, for several feet deep, of a loamy sand, in which deep pits may be sunk to bury large molds. This floor must be kept exceedingly dry, and free from any wet or moisture, otherwise the melted matter, converting the watery particles into vapor, would blow up the building and destroy the workmen. In the place where the mold is to be made, a layer of sand is lightly sprinkled through a sieve on the floor, and the wooden pattern pressed firmly down into it, level with the surface. The sand is then to be shoveled up all around, level with the top of the pattern, and rammed down with a tool. A moist sponge is then used for slightly wetting the sand all round the edges of the pattern, to make its particles adhere together. The next operation is lifting the pattern out of the sand by one or more screws, screwed into the wood. If the pattern is small, this can be easily done by one or more men; but in very large works it is effected by a crane. The workman then uses a pair of bellows for blowing away any small pieces of sand which may have fallen into the mold, and then sifts some finely powdered charcoal over its surface. It is now ready for filling with metal. In small works this is done by ladles and in large by small channels made in the sand, leading from the mold to the mouth of the furnace. When the mold is filled, the hot metal is covered with sand to keep the air from it while it is cooling.

Sand-casting between flasks is used for more complex articles than the former; such, for instance, as if they were cut into two or more pieces (provided the cutting planes were parallel to each other), each separate piece might be cast in open sand. The flasks are iron frames furnished with four handles, by which they may be lifted, and having iron points fitting into holes prepared in the other flask for joining them accurately together. The under flask being placed upon a board, filled with sand, and the sand rammed tight into it, the workman then takes the pattern and presses one half of it into the sand, and smooths the sand up to the sides of it with a trowel; he then sets the empty flask over the other, adjusting its points to the holes, and after sprinkling some sand which has been burned (to free it from moisture) over the sand in the under flask, he fills the upper one with sand, and rams it down; he next, with a piece of wood, put through the sand in the upper flask, makes a hole to pour the metal through. The upper flask, with the sand in it, is then raised off by men by the handles, or in large works by a crane, and the pattern lifted out. The flask is then put on again, and heavy weights laid upon it to keep it down ready for casting. It must be observed that at every uppermost point of large molds a small hole must be bored through the sand in the upper flask, to allow the rarefied air to escape out of the mold when melted metal is poured in. To save expense it is now customary to make flasks of any size that may be wanted, out of rectangular iron plates, which are fitted together by means of screws and bolts. This obviates the necessity of keeping a large store of flasks of different sizes, and enables the caster to adapt the form of the flask to that of the model for which it is intended.

Loam-casting is used for bulky, hollow articles, such as cylinders, large pipes, caldrons, boilers, etc., and is conducted in this manner: If, for instance, a large cylinder is to be cast, a mold has first to be made as follows: To a beam in the roof of the foundry is affixed a perpendicular spindle, with three or four holes through it to fix an iron arm in, at different heights, by means of a nut. This arm has two bars placed at such a distance as to be capable of receiving a wooden plank, which can be firmly secured to them by means of two clamps. The operation is then begun by laying an iron ring upon the ground, and adjusting it so as to be concentric to the spindle. A cylinder of brickbats, or clay and wet loam (instead of mortar), is then built upon it, some inches less in diameter than the intended cylinder, for which this is to form a core; the brickbats are then firmly bound together with iron hoops, annealed wire, etc., and a fire is lighted within the erection to dry it. When the loam used between the bricks is dry, a coating of loam is spread over the whole, and is perfectly smoothed by causing the edge of the perpendicular board to revolve round it. This coat makes it of the proper size for the inside of the cylinder to be cast, and is called the core of the mold. Another cylinder is built, plastered, and smoothed in the same way (except that no hoops are used), whose diameter is the same as the outside of the cylinder to be cast. When this is finished it is covered with a coating of charcoal, ground up with water like paint, laid on with a brush, and a thin coating of loam is laid on; this is bound round with hoops, and to these four hooks are fixed to lift it by; a thick coat of loam and hair is then laid over it. When all these are dry a man gets down into the cylinder, and with a small pick pulls down all the bricks in the inside cylinder, and then with a trowel cuts away all the loam, leaving the inside of the external cylinder (which is called the mold) quite smooth. This is effected by the coating of powdered charcoal, which prevents the two coats of loam from adhering. A deep pit is now dug in some convenient part of the foundry, into which the core is let down by a crane. The core being placed in the pit, the mold is let down after it by the same means; and when they are adjusted, the sand is thrown and rammed round about half the height; a flat cover of dried loam is then put on the top of the mold and core, and round pieces of wood are put in the holes which had before been made in the cover for pouring the metal in. The burying of

the mold is then completed. When it is all leveled, the sticks which keep open the holes for the metal are carefully withdrawn, and small channels made from the furnace to allow the melted iron to find its way to the mold. When the form is more complicated, as in pear-like shapes, etc., where a man cannot be introduced to pick out the bricks, the mold must be sawn in two perpendicularly with a fine saw to get it off. It is then put together again round the core, and the crack plastered up with loam.

Casting Away of Mrs. Lecks and Mrs. Aleshine, The, a story by Frank R. Stockton. This chronicle sets forth the curious experiences of Mrs. Lecks and Mrs. Aleshine; two middle-aged widows, from a little New England village, who, having "means," decide to see the world and pay a visit to the son of one of them, who has gone into business in Japan. On the steamer crossing the Pacific they meet a young Mr. Craig, who tells the story. The two ladies and Mr. Craig are cast away in most preposterous circumstances, on a lonely isle in mid-ocean. Many of the scenes, like the escape from drowning of the two widows, are of the very essence of true humor, of a grotesque form; and the story-teller's invention never once flags. The tale presents, intentionally of course, neither evolution nor climax, but only a succession of the oddest incidents. It is a good example of Stockton's unique method of story-telling — the matter extremely absurd and the manner extremely grave, the narrative becoming more and more matter-of-fact and minutely realistic, as the events themselves grow more and more incredible.

Castle, Edmund, English Orientalist: b. 1606; d. about 1685. His life was spent mainly in the compilation of his 'Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Samaritanum, Æthiopicum, Arabicum et Persicum' (1669), the Syriac division of which is still considered valuable, and he also aided Walton in the preparation of his 'Polyglot.'

Castle, Egerton, English author: b. 12 March 1858. He was educated at Glasgow University and Cambridge. After a brief military career he turned to literature and journalism, and has written: 'Schools and Masters of Fence' (1884); 'Bibliotheca Dimicatoria' (1891); 'Consequences' (1891); 'La Bella and Others' (1892); 'English Book Plates' (1892); 'Saviolo,' a play (1893); 'The Light of Scarthey' (1895); 'The Jerningham Letters' (1896); 'The Pride of Jennico' (1898); and 'Young April' (1899); 'Desperate Remedies,' a play; 'The Bath Comedy' (1899); 'Marshfield the Observer'; 'The Secret Orchard' (1900); 'The House of Romance' (1902). The last named novel with 'The Pride of Jennico' and 'The Bath Comedy' were written jointly by Mr. Castle and his wife, Agnes Castle.

Castle, a word derived from the Latin *castellum,* a diminutive of *castrum,* a fortress or stronghold. The word *castellum* was frequently appiled by the Romans as a military term to denote a redoubt. The word has come to be used as the designation of those strongholds which, in feudal times, served at once as residences and as places of defense for the nobles, and which continued to exist until the invention of gunpowder changed the whole system of fortification. The royal residences among the Franks resembled in some points both the Roman villa and the Roman camp, and those of the Frankish nobles differed little from those of the kings, except in point of simplicity. Strictly speaking, only the grand feudatories had the right to erect fortified castles, and then only after receiving the royal consent; but the grand feudatories very early began to take it upon themselves to grant the privilege of erecting castles to their vassals, and these again to those of a still lower grade. In this way large numbers of castles began to spring up at an early period in France, Germany, England, and elsewhere.

The castles of the Norman Conquest in England were probably the first stone buildings erected there. The great square keep of Rochester Castle is probably of this period; it is about 70 feet square, with projecting corner turrets, and as it now stands is 100 feet high, but the battlements have been altered and its original character lost. A heavy wall divides the huge structure into two nearly equal parts, and within this wall a well is arranged which communicates with all three stories; the outer walls are 12 feet thick at the base and the masonry is very perfect. Little is known of the ancient disposition of the minor buildings. There is no doubt that a high and battlemented wall enclosed a court or perhaps two courts, an inner and an outer bail, as they are called; that the keep was enclosed by the inner bail, but always so near the wall that a postern could communicate with the outer moat, and that within the enclosing wall, often built up against its interior face, were stables and storerooms, and also lodgings for the garrison, which last, however, might be temporary structures. This wall was always surrounded by a deep and broad moat, which might be filled with water in a low country, or, when dry, served merely to increase the effective height of the walls and to disarrange the approach of the besiegers. There was always a chapel, but in Rochester Castle this is built against the southeast corner of the keep and opens from its principal floor. In such an early castle the keep is the only very strong place, as a vigorous attack would breach or scale the outer wall very soon.

The castles of the 12th and 13th centuries were far more elaborate, and their tendency was toward separate posts, each defensible by itself. Every tower could be shut up and defended, its little garrison resisting even after the neighboring works had been captured or rendered indefensible. This arrangement had the disadvantage that a very bold and sudden attack might capture the strongest parts of the castle, even the keep itself, before assistance could come to it. The typical castle of the 12th century is the famed Chateau Gaillard in Normandy, and of the 13th century the famous castle at Coucy, near Laon in northern France; and in the British Isles, Kidwelly in Wales, which remains in a perfectly traceable condition.

The perfect castle was not developed until the time when gunpowder was about to make it useless. Thus the Chateau of Pierrefonds, north of Paris, and near Compiègne, was built about 1400, and in this the faults of the earlier castles were avoided. The walls are everywhere of nearly equal height, the galleries of de-

fense are continuous so that the soldiers of the garrison may run easily the whole length of the walls, and these galleries are two or even three deep, allowing the defenders to throw a prodigious rain of projectiles upon any attacking party. These galleries, built of stone, replace the temporary wooden galleries, always put up on the walls of earlier castles when an attack was anticipated. It is to be noted that the attack and defense in mediæval fortifications was vertical; the higher the wall the more formidable was the blow delivered by a falling ball of stone, or a timber or iron bar; while the projectiles from crossbows and military engines would certainly lose nothing, and the garrison in this way was removed far above the assailant, who must come close under the walls to attack. This attack, then, consisted, in the case of a well defended place, chiefly in breaching or undermining the walls. Escalade was only possible where the garrison was weak or in poor condition or surprised.

Castles often had outer works, thus the barbican or barbacan is strictly a defense built outside of the principal gate, and intended to keep the enemy away from it for a certain length of time. When a castle was near a river an outwork would be built on the other bank, covering the bridge leading to the castle. When the site was high, with steep approaches, a covered way might be built to protect the whole of the path leading up to the castle, and the foot of this would have an outwork or strong post capable of some defense.

The introduction of fire-arms and especially of cannon heavy enough to breach the walls, compelled a change in the old castles, which were often ruined as consistent pieces of mediæval fortification by having their towers cut down to accommodate artillery of defense. A round stone tower 200 feet high would be cut down to a kind of bastion 30 feet high, with a parapet and embrasures for cannon around its platform. Even this was only temporary, for it was soon found that the effect of artillery fire was irresistible by stone walls, and these were abandoned for the sloping rampart of earth introduced in the 16th century. See FORTIFICATIONS.

The term castle was applied to the sea-coast forts which defended our modern sea-ports previous to 1870, and of which some still remain. It was held that the stone wall, 8 or 10 feet thick, carefully built of granite blocks, with the embrasures covered by wrought iron plates and allowing of a great accumulation of guns within a small space, were proof against the attack of a fleet; and this because the fire from the decks of ships cannot be so exact as to produce a breach. It was assumed that the enemy would not be able to make a landing near with effective guns. Thus, at the entrance to Savannah, Fort Pulaski was a «sea-coast castle» of that type, but it was breached in a few hours by the rifled guns landed on Tybee Island.

In modern English nomenclature, a name compounded with castle (such as Castle Howard, Berkeley Castle, and the like) is used for habitable buildings which may have been erected on the site or immediate grounds of an ancient building of defense or within its old walls; but this is a mere whim in the selection of an arbitrary name. On the other hand, Windsor Castle, the favorite residence of Queen Victoria, has retained much of its mediæval defensive character, but the rooms inhabited by the royal family are of the reign of George IV., and the only part of the ancient work which remains in full use is the great chapel dedicated to St. George, a famous and beautiful building completed in the time of Henry VII.

RUSSELL STURGIS.

Castle Garden, the former immigrant depot in New York, at the point of Manhattan Island, in Battery Park. In the early days of the city the place was a small, fortified island a few feet from the mainland: later it became a public hall for assemblies and concerts. Here Jenny Lind made her American début. Many years ago the island was incorporated with the general area of the Battery by filling the intervening space with earth and rock; new buildings were erected, and the place was devoted to the purpose of landing steerage immigrants. In 1890 it ceased to be used as an immigrant depot, and was turned over to the Park Commissioners of the city of New York. The old fort is now used as a public aquarium.

Castle of Otran'to, The, by Horace Walpole. This story, with its natural personages actuated by supernatural agencies, is the prototype of that extraordinary series of romantic fictions which began with Anne Radcliffe, and was superseded only by the Waverley novels.

The reader's interest is aroused with the first page of the romance, and never flags. Conrad, son of Manfred, Prince of Otranto, about to marry Isabella, daughter of the Marquis of Vicenza, is found in the castle court, dashed to pieces under an enormous helmet. Now deprived of an heir, Manfred declares to Isabella his intention of marrying her himself; when, to his horror, his grandfather's portrait descends from the wall, and signs to Manfred to follow him. Isabella meanwhile, by the assistance of a peasant, Theodore, escapes to Friar Jerome. For this intervention, Manfred, now returned from his tête-à-tête with his grandfather's phantom, leads the youth into the court to be executed, when he is found to be Jerome's son, and is spared. At this moment a herald appears demanding of Manfred, in the name of Prince Frederick, his daughter Isabella, and the resignation of the principality of Otranto usurped from Frederick; who follows the proclamation, is admitted to the castle and informed of Manfred's desire to marry Isabella, when word comes that she has escaped from Jerome's protection. A series of ludicrous portents hastens the dénouement: drops of blood flow from the nose of the statue of Alphonso, the prince from whose heirs the dukedom has been wrested; unrelated arms and legs appear in various parts of the castle; and finally, in the midst of the rocking of earth, and the rattling of «more than mortal armor,» the walls of the castle are thrown down, the inmates having presumably escaped. From the ruins the statue of Alphonso, raised to gigantic proportions, cries, «Behold in Theodore the true heir of Alphonso.» Isabella, having been rescued at the critical moment, is of course married to Theodore.

This wildly romantic tale, published in 1764, was enthusiastically received by the public; who, as Mr. Leslie Stephen so well says, «rejoiced to be reminded that men once lived in

castles, believed in the Devil, and did not take snuff or wear powdered wigs."

Castle Peak, in Mono County, California, lying to the north of Mono Lake in lat. 38° 10′ N. It rises to about 13,000 feet above the sea.

Castle Rackrent, by Maria Edgeworth. This, as the author announces, is "an Hibernian tale taken from facts and from the manners of the Irish squire before the year 1782." The memoirs of the Rackrent family are recounted by Thady Quirk, an old steward, who has been from childhood devotedly attached to the house of Rackrent. The old retainer's descriptions of the several masters under whom he has served, vividly portray various types of the "fine old Irish gentleman." Sir Walter Scott has acknowledged that his original idea, when he began his career as a novelist, was to be to Scotland what Miss Edgeworth was to Ireland.

Cas'tlebar, Ireland, the capital of County Mayo. It is on the Castlebar River, 10 miles northeast of Westport; has infantry and cavalry barracks, and some linen manufactures. In 1641 occurred here the massacre of the English Parliamentary army in the Irish rebellion; in 1789 Castlebar was held for a fortnight by the French general, Humbert; and in 1846–7 it suffered greatly from famine. Pop. about 4,000.

Cas'tleford, England, a thriving manufacturing town in the West Riding of Yorkshire, on the Aire, here crossed by a bridge, 10 miles southeast from Leeds. The public buildings include the church of All Saints, several denominational chapels, schools, a market-hall, mechanic's institute, etc. There are numerous collieries in the neighborhood; and the town has extensive manufactures of glass bottles, earthenware, and chemicals. Pop. (1901) 17,382.

Cas'tlemaine, Australia, a municipal town in the colony of Victoria, in the county of Talbot, at the junction of Barker and Forest creeks, 78 miles northwest of Melbourne, on the Melbourne & Echuca R.R., with branch communication by Maryborough with Ballarat. The town is pleasantly situated and well laid out, and the buildings, both public and private, are of a superior character. The principal public buildings are the town-hall, the hospital, the supreme court, and the mechanics' institute. Castlemaine owes its importance to the mining industry carried on in its neighborhood. Pop. (1901) 6,082.

Cas'tlemon, Harry. See FOSDICK, CHARLES AUSTIN

Castlereagh, kăs'ĕl rā, **Robert Stewart,** VISCOUNT, English statesman: b. 18 June 1769; d. 12 Aug. 1822. He was educated at Armagh, and at St. John's College, Cambridge. He turned Tory in 1795, and next year became keeper of the privy seal; but he continued a steadfast supporter of Catholic emancipation. Still, he believed that emancipation with an independent Irish parliament would mean simply a transference of tryanny from the Protestant oligarchy to a Catholic democracy; hence, as chief secretary from 1797, he bent his whole energies to forwarding Pitt's measure of union. Transferred by the union from Dublin to Westminster, he accepted office in the Addington ministry (1802) as president of the board of control; but the true second era in his career was as war minister under Pitt from July 1805 to January 1806, and again under Portland from April 1807 to September 1809. His real greatness begins with March 1812, when, as foreign secretary under Lord Liverpool, he became the soul of the coalition against Napoleon, which, during the momentous campaigns of 1813–4, was kept together by him, and by him alone. He represented England at the congresses of Chatillon and Vienna in 1814–5, at the Treaty of Paris in 1815, at the Congress of Aix-la-Chapelle in 1818; and he was preparing to start for a congress at Verona, when, in a fit of insanity, he committed suicide with a pen-knife at Foots Cray, his Kentish seat.

Castlereagh, Ireland, a barony in the County of Down. The castle stands on the summit of a Danish rath, and was once the seat of an O'Neil. It is now the property of the Marquis of Downshire. The barony gives the title of viscount to the Marquis of Londonderry.

Cas'tleton, England, a village in the County of Derby, situated at the bottom of a rugged eminence, on which stands the ancient castle called Peak Castle, erected by William Peveril, natural son of the Conqueror. The houses are chiefly of stone. It contains the parish church, a fine specimen of the early pointed style; two Methodist chapels, and a free grammar-school. The inhabitants are mostly employed in mining; but many derive a subsistence from the manufacture of ornamental articles from spar. It is the scene of Scott's novel, 'Peveril of The Peak.'

Cas'tletown, Great Britain, a seaport and former capital of the Isle of Man, on Castletown Bay, 11 miles southwest of Douglas. Castle Rushen, now a prison, occupies the site of a Danish fortress of the 10th century, which was almost wholly demolished by Robert Bruce in 1313. The grounds of Rushen Abbey (11th century), near the station, are now market gardens. Near by is the small building where the House of Keys assembled for about 170 years. Brewing, tanning, and lime-burning are carried on. Near Castletown is King William's College, an Elizabethan pile, rebuilt after the fire of 1844.

Cas'tor and Pollux (the latter called by the Greeks Polydeuces), the sons of Tyndareus, king of Lacedæmon and Leda, or, according to some, of Zeus and Leda. The fable runs that Leda brought forth two eggs, one of which contained Pollux and Helen, the other Castor and Clytemnestra. Pollux and Helen, being the offspring of Zeus, were immortal; but Castor and Clytemnestra were begotten by Tyndareus, and mortal. Homer's account is that both Castor and Pollux were the sons of Tyndareus, and that Helen was the daughter of Zeus. The two brothers were inseparable companions, equally brave and spirited, and attached to each other with the fondest affection. Castor was particularly skilled in the art of breaking horses, and Pollux in boxing and wrestling. They were among the heroes of the Argonautic expedition, in which they acquired divine honors; for a terrible tempest having arisen on the voyage, and all with loud voices calling on the gods to save them, there suddenly appeared over the heads of Castor and Pollux two star-like meteors, and the tempest subsided. From this time they were the patron deities of mariners,

and received the name of Dioscuri («sons of Zeus»); and from them the name of Castor and Pollux was given to the fires that are often seen on the masts of vessels in storms, and which are electrical phenomena. After their return they released their sister Helen from the confinement in which Theseus had for some time held her. They were also among the heroes of the Calydonian hunt. They wooed the daughters of Leucippus, Phœbe and Hilaeira or Elaeira, and carried them off and married them. Having become involved in a quarrel with Idas and Lynceus, the sons of Aphareus, Castor killed Lynceus, and was slain by Idas. Pollux revenged his brother's death by killing Idas, but full of grief for the loss of Castor, he besought Zeus either to take away his life or grant that his brother might share his immortality. Zeus listened to his request, and Pollux and his brother alternately resided one day on earth and the other in the heavenly abodes of the gods. It is doubtful whether the ancients understood them as being together or separate in their alternate passage between the upper and the lower worlds. The former opinion seems to be the oldest; the latter to have gained ground subsequently. Temples and altars were consecrated to them. In great perils, especially in battles, the ancients believed that they frequently appeared to mortals as two youths on white steeds, in shining garments, with meteors over their heads; and then they were chiefly called Dioscuri. They were also represented side by side, either riding or standing, each holding a horse by the rein, with spears in their hands and stars on their heads. In the heavens the Dioscuri appear as one of the 12 constellations of the zodiac, with the name of Gemini (the Twins).

Castor, or **Castor'eum,** an odorous substance obtained from two glandular sacs connected with the sexual organs in both sexes of the beaver. In past years it was utilized for medical purposes, especially as a remedy in diseases of the uterus, and in the case of catalepsy, hysteria, and other spasmodic diseases. What little now reaches market is used as an ingredient of perfumes, but most of it is kept by northern trappers as a scent for baiting their traps, and is known as barkstone.

Castor Oil (*Oleum ricini*), the fixed oil expressed from the seeds of *Ricinus communis,* of the family *Euphorbiaceæ.* The oil is obtained from the seeds by various processes. The seeds are sometimes boiled and the oil skimmed from the water, or the oil may be taken up by solvents, such as alcohol, ether, etc. In the large manufacturing pharmacy houses in the United States the seeds are first warmed slightly and then passed between rollers, or other forms of pressure apparatus. The oil is collected and decanted, or mixed with boiling water and purified. The average yield of high-grade oil is from 40 to 50 per cent in weight. Care must be exercised in the amount of heating of the seeds, else a very active and acrid toxalbumin, ricin, which is present in the seed coat, is added to the oil. This tends to render the oil very griping in its action. Unscrupulous manufacturers have been known to add small quantities of ricin to adulterated oil. Seconds, or sorts, are inferior qualities of oil.

When fresh and pure castor oil should be a clear, colorless, viscid oil, with a faint, mild odor, a bland and unpleasant taste. Its specific gravity should be .950-970 at 60° F. It should be soluble in equal parts of alcohol; in all proportions of absolute alcohol, or in glacial acetic acid, and tested to exclude other mixed oils, is soluble at 60° F. in three times its volume of a mixture of 19 parts of alcohol and one part of water. This test will detect an admixture of over five per cent of other oils. Castor oil congeals at —18° F. The chemical structure shows castor oil to be composed almost entirely of ricinoleic acid. This is broken up in the intestines by saponification, and sets free the active agent of the drug's action. Castor oil is a reliable cathartic. It empties the bowel completely, largely by its stimulating intestinal peristalsis, and is probably the best cathartic for children with overloaded intestines. In intestinal fermentation and putrefaction accompanied by diarrhœa, it is excellent. It causes a number of loose, not very watery movements, attended with mild griping. There is a tendency to constipation following its use; hence, it is not of service in habitual constipation. As it is extremely disagreeable for many, its taste may be disguised by orange peel, or best in some aromatic frothy or carbonated mixture, as in coffee, soda water, or sarsaparilla soda water. From a teaspoonful to a tablespoonful is the usual dose.

Castor-oil Plant, Castor-bean, or **Palma Christi,** a tropical herb (*Ricinus communis*) of the natural order *Euphorbiaceæ,* a native of Africa and Asia, whence it has become distributed in warm countries throughout the world. In cool climates it is a half-hardy annual, but in frostless regions it is a perennial, often becoming a small tree. Its large palmate leaves, sometimes more than two feet in diameter, and its green or red stems, which in the central United States may attain a height of 12 feet, and in the tropics 30 or 40 feet, are very striking in flower borders and clumps of shrubbery. The unisexual flowers are borne in terminal racemes, and the female ones are succeeded by three-celled spiny capsules which explode when the seed is ripe, throwing the seed to a considerable distance. The seeds have long been employed for making castor oil, which is used for lubricating, for making sticky fly-paper, and in medicine. About half the demand of the American market is met by the crops grown in Kansas, Missouri, Oklahoma, and adjacent territory, but since the introduction of petroleum products the oil has a smaller use as a lubricant than formerly, and since the importation of various palm oils its use in soap-making has declined. It is also less popular as a medicine than it used to be. The crop is not considered a paying one. Castor-oil pomace (the oil cake after the oil has been extracted) is a highly valuable nitrogeneous fertilizer.

Castor'idæ. See BEAVER.

Castoroi'des, a gigantic, extinct, beaver-like rodent of the Pleistocene epoch in North America. It was as large as a black bear, and inhabited the cold, swampy, evergreen forests of the north, its remains being found chiefly in peat-bogs along with bones of the mastodon.

Castrameta'tion, the art of tracing out and disposing to advantage the several parts of a camp on the ground. See CAMP.

Castration, the removal of the testicles or ovaries of animals. Castration is usually performed to limit reproduction, to change the character of the working animal, making him more docile and easier to train, or to improve the quality of meat for eating, as in capons. In human beings castration is a surgical procedure and is usually performed for the relief of some irremediable or malignant disease. Thus in tuberculosis and cancer of the testicles, and in malignant or painful disease of the ovaries, the operation is justifiable. There has been a large amount of needless removal of the ovaries in women. The after results are often more annoying than the original disease.

The change produced in men by emasculation is highly remarkable, and assimilates their constitution in some respects to that of females. The elasticity of the fibres and muscles is weakened, and the cellular membrane becomes charged with a much larger quantity of fat; the growth of the beard is prevented; the upper part of the windpipe contracts considerably, and the castrate acquires the physiognomy and voice of a female. On the moral character it likewise appears to have some influence by weakening the intellectual faculties and rendering the subject unfeeling, morose, faint-hearted, and on the whole incapable of performing those deeds which require a high, magnanimous disposition. The most numerous class of castrates are those who are made such by the removal of the testicles. Another class are not deprived of the parts of generation, but have them ingeniously injured in such a manner as to leave them the faculty of copulating, but deprive them of the power of begetting. Juvenal mentions these as the particular favorites of the licentious Roman ladies. To the third class belong those who are entirely deprived of their genital members. They are used in preference, by the Turks, as keepers of their women. The castrates of all three classes are called eunuchs. Those of the third class, to distinguish them from the two others, are frequently termed entire eunuchs. The word eunuch is Greek, and signifies «guard» or «keeper of the bed.» The castration of adults produces some change in the disposition, but little in the bodily constitution. Even the power of engendering continues for a short time. According to the accounts of ancient historians, the Lydians, celebrated for effeminacy, castrated women. The latter are said to have used these beings as guards of their wives and daughters. With females the operation produces a completely opposite effect to that which it has on men. The sexual appetite ceases, a beard appears on the chin and upper lip, the breasts vanish, the voice becomes harsh, etc. Boerhaave and Pott relate modern instances of this kind. Among the evils which religious fanaticism has at all times produced, castration is conspicuous. The emperors Constantine and Justinian were obliged to use their utmost power to oppose this religious frenzy, and could put a stop to it only by punishing it like murder. The Valerians, a religious sect whose minds had been distracted by the example of Origen, not only considered this mutilation of themselves a duty which religion imposed on them, but believed themselves bound to perform the same, by fair means or foul, on all those who came into their power. In Italy the castration of boys, in order to form them for soprano singers, was in use for a long time. Clement XIV. prohibited this abuse, which, notwithstanding, did not cease till comparatively recent times, and in some Italian towns was not only suffered but exercised with such shameful openness that the practitioners gave public notice of their profession. In modern times severe laws were enacted against castration, and the custom is probably now extinct. Beings thus mutilated were common on the European stage. It is remarkable that so odious and unnatural an operation should produce the fine effect on the tones of the singer, which all had to acknowledge notwithstanding the disagreeable effect of the association.

Castrén, käs-trān', **Matthias Alexander,** Finnish philologist: b. Tervola 2 Dec. 1813; d. Helsingfors 7 May 1852. While attending, as a young man, the University of Helsingfors he conceived the project of tracing out the various detached branches of the Finnish races and languages, and presenting their ethnological and philological phenomena in one general view. Following out this idea he undertook in 1838 a pedestrian excursion through Finnish Lapland, and another in 1840 through the district of Karelia, with the view of studying the primitive language of that country, and enabling himself to translate therefrom into Swedish the great Finnish epic of the 'Kalevala.' This last work was accomplished by him after his return. He soon, however, resumed his travels, and for several years continued to prosecute his researches among the nations of the Arctic regions, both in Europe and Asia, including the Norwegian and Russian Lapps, and the Samoyeds of Siberia and the coasts of the White Sea. Naturally of a weakly constitution, and in a failing state of health, he was frequently obliged in addition to submit in the course of his journeys to the most extreme privations. Having returned home from his last journey to the Samoyeds, he was appointed in 1851 professor of the Finnish and old Scandinavian languages in the University of Helsingfors, but died before he had been able to add much more to his work — a martyr to the cause of science. Among his writings are: his translation of the 'Kalevala'; 'Elementa Grammatices Syrjænæ'; 'Elementa Grammatices Tscheremissæ'; and 'De Affixis Personalibus Linguarum Altaicarum'; besides travels and other works published after his death.

Castres, kästr, France, a town (ancient CASTRUM ALBIENSUM) in the department of Tarn, 23 miles south-southeast of Albi, on the Agout, which divides it into two parts — Castres Proper, north side, and Villegoudon, south side of the river. The public buildings include the hôtel de ville, formerly the episcopal palace, which contains a public library, and has a garden laid out on the plan of the Tuileries; three churches, one of them Protestant; two hospitals, a theatre, cavalry barracks, etc. The manufactures consist of fine cloths, coarse cloth for the troops, flannels, blankets, and other woolen goods, linen, glue, and black soap. There are also bleaching-grounds, dyeworks, tanneries, paper-mills, forges, and brass-foundries. Trade is also carried in in silk, cotton, liqueurs, and confectionery. Castres has a communal college and two seminaries. The town arose round an abbey of the Benedictines (which is said to have

been founded in the 9th century), and was already in the 12th century a place of importance. During the religious wars of the 16th century Castres was the scene of many conflicts. Louis XIII., to whom the town surrendered in 1629, ordered its fortifications to be razed to the ground. Pop. about 20,000.

Castries, Charles Eugène Gabriel de la Croix, shärl ė-zhān gä-brē-ĕl dė la krwä käs-trē, MARQUIS OF, French soldier: b. 1727; d. 1801. He entered the army, fought at Dettingen and in lower Alsace, became lieutenant of Languedoc and governor of Montpellier and Cette, and under Marshal Saxe commanded the army in Flanders, where he covered the sieges of Menin, Ypres, and Courtray, and ended the campaign with the battle of Courtray. He afterward fought at Fontenoy, Raocoux, and Laufeld. During the Seven Years' war he added greatly to his fame, was made lieutenant-general, and was dangerously wounded in the battle of Rossbach. In 1783 he was marshal of France, and emigrating in 1791 found an asylum with the Duke of Brunswick. He subsequently commanded the army of the French princes in Champagne, and countersigned the manifesto issued by Monsieur in 1793. In 1797 he formed, in conjunction with St. Priest, the so-called cabinet of Louis XVIII. at Blankenburg.

Castriota, käs-trē-ō'tä, George. See SCANDERBEG.

Castro, käs'trō, Augustin, Mexican poet: b. Cordova, Vera Cruz, 24 Jan. 1728; d. Bologna, Italy, 1790. He became a Jesuit priest and a teacher of philosophy, and was a skilful translator of classical authors. Among his original works in poetry are: 'Hernán Cortez' and 'Charts,' a guide for young poetic genius. His versions of Sappho, Euripides, Horace, Seneca, Milton, and Fénelon have received high praise from scholars.

Castro, Cipriano, Venezuelan military leader: b. Capacho, Venezuela, near the frontier of Colombia, about 1855. His parents were Spanish mestizos of the peasant class. He attended school in Capacho. While still a very young man he took an active part in politics in Capacho, as a Liberal. His first military exploit consisted in scoring a moderate success in the so-called "Battle of Capacho" (1886) against Morales, the local representative of the Lopez government. He remained a leader of the Liberal party in his state until 1892. In that year began Crespo's rebellion against Andueza. Castro, supporting Andueza's cause, was victorious in the battle of 15 May 1892, in Táriba; defeating Morales who now was under Crespo's command. In Caracas, however, the insurgents triumphed. Crespo entered the capital 6 Oct. 1892. Castro remained in control of Táchira and Merida, but before the end of the year withdrew across the Colombian frontier and bought a farm near Cúcuta in the department of Santander. For the next six or seven years he was a farmer and cattle-raiser. Invited by Crespo to take office as head of the custom-house at Puerto Cabello, he declined this offer, but promised Crespo not to join his enemies or attack his government. Andrade was Crespo's successor. Castro went to Caracas and called on the new president. Accounts of this visit differ. Castro's partisans assert that he again refused the tender of an office under the government; according to another version he was insulted, and left the Yellow House vowing vengeance. When he returned to his home some political friends and relations of Andrade's who lived in Cúcuta procured from the Colombian government an order for his arrest. For about two months he was in hiding; then he invaded Venezuela with only 60 men (23 May 1899). His old followers in Táchira joining him, in three days he collected a force of 1,500. The first skirmish was in the country between San Cristóbal and Rubio. In Las Pilas the commander of the government's frontier troops fell. At Zumbador about 2,000 men led by Morales were defeated. Castro laid siege to San Cristóbal, where Peñalosa was strongly entrenched. About 6,000 men under Fernandez were sent against him from Caracas. An indecisive engagement occurred. Then Castro left Fernandez in the rear, and marched toward the capital, defeating several government forces on the way. Andrade having fled the country, Castro entered the capital, opened the prison in which Hernandez had been confined for many months, and declared himself "jefe supremo"— neither president nor dictator, but "supreme military leader." The constituent assembly made him provisional president of Venezuela, 30 March 1901, and on 20 February 1902 he was elected president for the term of six years. But his duty has continued to be that of a miltary leader. Hernandez promptly revolted, and was put back into prison. Celestino Peraza was the next rebel; and after Peraza came Matos, who intrigued to gain the support of foreign governments. See VENEZUELA.

Castro, Guillen de, Spanish dramatist: b. Valencia 1569; d. Madrid 28 July 1631. He was at one time commander of a Neapolitan fortress. In his later years he lived in Madrid, and was on intimate terms with Lope de Vega. Castro's memory has been chiefly preserved by his authorship of 'Las Mocedades del Cid,' to the first part of which Corneille was indebted for the plot and many of the beauties of his celebrated tragedy. The other plays of Castro are badly constructed, and chiefly distinguished for their intensely national spirit.

Castro, Ines de, ē nĕs dā, Spanish lady: d. 1355. She was descended from the royal line of Castile. After the death of Constantia, wife of Pedro, son of Alfonso IV., king of Portugal, in 1345, Ines was secretly married by Pedro, whose mistress she had already been. As he steadily rejected all propositions for a new marriage, his secret was suspected, and the envious rivals of Ines were fearful that her brothers and family would gain a complete ascendency over the future king. At length Alfonso resolved to put Ines to death. The first time that Pedro left Ines, the king hastened to Coimbra, where she was living in the convent of St. Clara with her children. The arrival of Alfonso filled the unhappy lady with terror. She threw herself with her children at the king's feet, and begged for mercy. Alfonso was softened, but afterward gave his counselors permission to commit the murder, and it was executed that very hour. Ines expired under the daggers of her enemies. She was buried in the convent where she was murdered. Pedro took arms against his father, but soon became reconciled to him.

Two years later Alfonso died; the assassins had already left the kingdom and taken refuge with Pedro the Cruel of Castile. An exchange of fugitives was carried out. Of the three murderers of Ines, one escaped, but the other two were tortured in the presence of the young king Pedro at Santarem in 1360. Their hearts were torn out, their bodies burned, and their ashes scattered to the winds. Two years later, it is said, King Pedro at Cataneda declared on oath that after the death of Constantia he had obtained the consent of the Pope to his union with Ines, and had married her. The archbishop and Lobato confirmed the assertions of the king; and the Papal document to which the king referred was publicly exhibited. The king caused the body of Ines to be disinterred, and placed on a throne, adorned with the diadem and royal robes, and required all the nobility of the kingdom to approach and kiss the hem of her garment, rendering her when dead that homage which she had not received in her life. The body was interred at Alcobaça, where a splendid monument of white marble was erected, on which was placed her statue, with a royal crown on her head. The history of the unhappy Ines has furnished many poets of different nations with materials for tragedies, and the Portuguese muse has immortalized her through the lips of Camoens, in whose celebrated 'Lusiad' the history of her love is one of the finest episodes.

Castro, Joao de, zhō-owń' dā, Portuguese navigator: b. Lisbon 7 Feb. 1500; d. 6 June 1548. In 1538 he accompanied the viceroy Garcia de Neronha, his uncle, to India, as commander of a vessel, and in 1540 was in the expedition that explored the Red Sea, of which he made charts and scientific descriptions. His profound knowledge of mathematics and languages made these works of great value. They were published under the title of 'The Log-book of Don John de Castro, on the Voyage which the Portuguese made to the Red Sea.' After his return he was made commander of a fleet to rid the European seas of pirates; was appointed governor of India in 1545, in which office he defeated the great army of the Moors, under Adhel Khan, and completely subjugated Malacea. In 1547 he was commissioned viceroy of India, but died shortly afterward.

Castro, Jose Maria, hō-sā' mä rē'ä, Costa Rican statesman: b. San Jose 1 Sept. 1818. He was educated at the University of Leon, Nicaragua, and held positions under the government of Costa Rica. In 1846 he was vice-president and in 1847 was elected president. After Costa Rica withdrew from the Central American states, he resigned the presidency, but held diplomatic positions. From 1866 to the rise of the Jimenez government (1868) he was again president.

Castro Urdiales, a seaport town of Spain, on the Bay of Biscay, in the province of Santander. It was sacked by the French in 1811, but has since been neatly rebuilt. A ruined convent of the templars is in the vicinity. It has a safe harbor, and extensive fisheries. Pop. (1900) about 13,000.

Castro-Del-Rio, a town in Spain, Andalusia, 16 miles southeast of Cordova, on a slope above the Guadajoz. The more ancient portion is surrounded by a dilapidated wall, flanked with towers, and entered by one gate, which was defended by an Arab castle, now also ruinous. The modern portion is outside the walls, and extends along the foot of the hill on its north side. The most of the streets are wide and regular, lined with well-built houses and handsome public edifices. The church is large and handsome, and there are also several convents, two colleges, primary schools, hospitals, and manufactures of linen, woolen, and earthenware. Pop. (1887) 11,290.

Castrogiovanni, or **Castro Giovanni** (anc. ENNA), a city of Sicily, in the district of Caltanisetta, on a plateau in the centre of the island, 4,000 feet above the sea. The climate is healthy, the soil fertile, and water abundant. The old feudal fortress of Enna is the chief edifice. It contains also a cathedral. It was the fabled birthplace of Ceres, and the site of her most famous temple. About five miles distant is the lake of Pergusa, where Proserpine, according to the poets, was carried off by Pluto. During the first servile war the insurgent slaves made Enna their headquarters. It was captured by the Saracens in the 9th and by the Normans in the 11th century. Pop. 19,800.

Cas'trum Dolor'is, a Latin term signifying castle of grief, has a different meaning from *catafalco.* The latter is used to denote an elevated tomb, containing the coffin of a distinguished person, together with the tapers around, ornaments, armorial bearings, inscriptions, etc., placed in the midst of a church or hall. The *castrum doloris* is the whole room in which the *catafalco* is elevated, with all the decorations. The sarcophagus, usually empty, is exposed for show upon an elevation covered with black cloth, under a canopy surrounded with candelabra. Upon the coffin is laid some mark of the rank of the deceased, as his epaulette or sword, and, when the deceased was a sovereign or a member of a ruling family, princely insignia are placed on surrounding seats. The French call the *castrum doloris, chapelle ardente,* sometimes also *chambre ardente;* but the latter has also a separate meaning.

Castuera, käs-too-ā'rā, Spain, a town in the province of Badajoz, near the right bank of the Guadalefra. Most of its streets are straight, clean, and well paved. It has two squares, lined with substantial houses; the principal one contains the town-hall, prisons, and spacious modern parish church. The inhabitants are engaged in weaving, making earthenware, tiles, bricks, shoes. Trade is carried on in cattle, wool, wine, grain, and oil. Pop. 7,133.

Casualty Insurance. See INSURANCE, CASUALTY.

Casuarina, kăs-ū-ą-rī'na, or **Botany-bay Oak,** the single genus of the natural order of *Casuarinaceæ,* or cassowary-trees. There are about 30 species, natives chiefly of Australia. They are jointed leafless trees or shrubs, nearly related to the birches, having their male one-stamened flowers in whorled catkins, and their fruits in indurated cones. Some of them produce timber called beefwood, from its color. *C. quadrivalvis* is called the she-oak, *C. equisetifolia,* the swamp-oak.

Cas'uistry, the science or art of determining cases of conscience and the moral character of human acts; so called from *casus conscien-*

tiæ, a case of conscience. Wherever the question rises, Is such an act allowable by moral law? there is a case of conscience and matter of casuistry, and in deciding the question for himself, as everyone habitually does, everyone is a casuist. But in current usage a casuist is one who, skilled in the prescriptions of the divine moral law and its interpretation whether by lawgivers, moralists, or theologians, studies either suppositions or actual cases of conscience and judges whether a given act, or even a given thought is consistent with or in violation of moral law — for, unlike the civil lawgiver or the ministers of civil law, the casuist must determine the moral character of thoughts no less, or rather more, than of acts. The professional casuist is inevitable in the system of the Catholic Church, where the minister of religion, in his capacity of *confessarius* or confessor must be the counselor and director of penitents and resolve for them questions of guilt or innocence, questions touching the obligation to restitution, for example of goods, or reparation of damage to a neighbor's reputation by slander; granting or withholding absolution according to the merits. For the minister of the sacrament of penance acts under Jesus Christ's commission, whose sins ye shall forgive, whose sins ye shall retain, shall be forgiven or retained; and to execute that commission the minister of the sacrament must decide for himself and the penitent the moral character of the acts. The science or art of casuistry has doubtless been carried to extraordinary lengths; but though the questions which it treats are such as touch individually and most intimately daily and hourly the many millions of souls who resort to the confessional, the works of writers on casuistry, though voluminous, would count as a scant armful compared with only one part of the works contained in a law library — those which record the decisions of the civil courts. It is true also and inevitable that casuistry like law lore is often employed as a means of escaping from legal penalty or of quieting the sense of guilt. As there are lawyers who for a fee will defend any cause however defenseless morally, even to the extent of working injustice — loss of property, loss of reputation to the party opposite — so there are casuists who by their overinclining to an indulgent interpretation of the divine moral law, release or cut the nerve of moral responsibility, administer an opiate to conscience.

Probabilism is the name given to the doctrine which declares to be lawful *in foro conscientiæ* an act the moral correctness of which is affirmed by any moral theologian of weight (*doctor gravis*); or, as defined by Liguori, a probable opinion is one which rests on a solid foundation (*fundamento gravi*) both of reason and of authority, so that it is able to move the assent (*fleetere assensum*) of a prudent man, though with fear regarding the opposite. But a writer in a great encyclopædia, who regards probabilism as "the most remarkable doctrine they (the casuists) promulgated — a doctrine which it is hard to believe that any one ever ventured to assert" teaches that "according to probabilism" "any opinion which has been expressed by 'a 'grave doctor' may be looked upon as possessing a fair amount of probability, and may, therefore, be safely followed, even though one's conscience may insist upon the opposite course": the last clause is gratuitous and has no warrant in the teachings of Catholic moralists, who unanimously hold that an act done in defiance of conscience, even be it a plainly erroneous conscience, is a sin.

Viewed in the abstract, the rule of the probabilists is not an unreasonable one: it is acted upon daily by whoever, doubting his own judgment, asks counsel of others whom he regards as trustworthy advisers, even though they be not grave doctors (*graves doctores*). It is admitted that some of the probabilists, even the greatest of them, as Escobar, Suarez, Busembaum, did not always guard the doctrine against misconstruction, and gave occasion for views of moral obligation which were too lax: but the ecclesiastical censure has fallen upon such erroneous teachings, without discrediting for Catholic moralists the principle of probabilism. Let any other school of moral teaching set to itself the same task which confronts the moral theologian of the Catholic Church, that is, to define with precision the moral character of every act, every thought, every imagination that has relation to the moral law, and it will be seen whether probabilism must not have a place in its system.

Ca'sus Bel'li, the material grounds which justify (or are alleged by one of the parties concerned to justify) a declaration of war (q.v.). The *casus belli* is not seldom a very trifling one, and does not necessarily indicate the real *causa belli* or cause of the war.

Cas'well, Richard, American lawyer: b. Maryland 3 Aug. 1729; d. 20 Nov. 1789. He removed to North Carolina in 1746; was president of the Provincial Congress which framed the State Constitution (1776), and first governor of the State, three times re-elected; was also a delegate to the convention which framed the Federal Constitution in 1787.

Cat (*Felis domesticus*), a well-known domesticated quadruped of the order *Carnivora*, the same name being also given to allied forms of the same order. Some have thought that the domestic breed owed its origin to the wild cat; but there are considerable differences between them, the latter being larger, and having a shorter and thicker tail, which also does not taper. The domestic cat belongs to a genus — that which contains the lion and tiger — better armed for the destruction of animal life than any other quadrupeds. Its short and powerful jaws, trenchant teeth, cunning disposition, combined with nocturnal habits (for which its eyesight is naturally adapted) and much patience in pursuit, give it great advantages over its prey. It is characterized by six incisor teeth above and below; two canine teeth in each jaw, powerful and formed for tearing; molar or cheek teeth, four in the upper jaw and three in the lower, thin, pointed, and wedge-shaped, formed for cutting. The head is large, round, and wide; the eyes have the pupil often oblong; the tongue has strong horny papillæ, directed backward. The feet are formed for walking; the toes are five in number on the fore feet, and four on the hind feet, armed with strong, sharp, and hooked claws, retracted when the animal walks. The intestines are very short, as in all animals living almost exclusively on animal food. The cat in a degree partakes of all the attributes of its race. Its food in

a state of domestication is necessarily very various, but always of flesh or fish if it can be obtained. Instances of its catching the latter are known, though usually the cat is extremely averse to wetting itself. It is a very cleanly animal, avoiding any sort of filth, and preserving its fur in a very neat condition. Its fur is easily injured by water on account of the want of oil in it, and it can be rendered highly electric by friction. The cat goes with young for 63 days, and brings forth usually from three to six at a litter, which remain blind for nine days. It is usually regarded as less intelligent than the dog, but this is by no means certain. It has a singular power of finding its way home when taken to a distance and covered up by the way. The wild cat (*Felis catus*) is still found in various parts of Europe and western Asia, chiefly in forest regions, making its lair in hollow trees or clefts of rocks. It is a very fierce animal. There are a number of other animals, of similar size and habits, known as cats, such as the fishing-cat (*F. viverrina*) of Bengal and eastern Asia, the leopard cat (*F. bengalensis*) of northern India and southeastern Asia, the marbled cat (*F. marmoräta* of the same region, the rusty-spotted cat (*F. robiginösa*), a small Indian species, etc. For varieties of the domestic cat see CAT IN AMERICA.

Cat, Domestic, The. There is little doubt that the influence of the domestic cat upon American civilization has received less consideration than it deserves, for a great deal of the advance in agriculture, as well as of the spreading out over the vast woodlands and prairies of America, has been made possible by this much abused and misunderstood animal. For places suddenly thrown open to settlement the cat is often one of the first things sought, is one of the first of the necessary household gods, and goes in with the cooking-stove and the dish-pan. The reason for this is, that on our great prairies mice are found in countless thousands. The settler, not being near a town, buys his goods by the wagon-load, and, being able to go to the base of supplies only once or twice a year, stores his food in barrels and sacks, enough, perhaps, for six months ahead. This opportunity is not lost by the mice, which, swarming indoors out of the prairie grass, find ideal conditions; abundance of food, warmth, shelter, and comfort. If the simple eating of the food ended the trouble, it would not be so bad, but field-mice, imbued as they are with the instinct of storing everything, have a knack of mixing different things together — the rice with the coffee, sugar with both, etc., until there is a *potpourri* that no one can separate, and cooking is made impossible.

After such happening the settler speedily seeks a cat, and the prices paid would astonish those who think cats merely a nuisance. How much food cats have saved, how much property they have guarded from destruction, what plagues of vermin they have kept in check, from the time this country was first settled, it is impossible to compute. But for their sleepless vigilance the large cities would quickly be overrun with rats and mice. How indispensable their service is may be seen in the condition of farms in the British Isles, rendered useless by rats and mice, because the cat, as well as the hawk and the owl, is suppressed to make way for the game preserve, to afford the pleasure of shooting for a few weeks, or perhaps, only a few days in the year.

The cat, then, is a necessary adjunct to our civilization, a factor and an institution to dislodge which would imperil our status as a nation; and until a substitute can be found the cat is an economic necessity in our daily life that cannot be done away with without upsetting the balance of nature greatly to our disadvantage. This fact is recognized by the government, which appropriates money every year for the maintenance of cats in the post-offices and other public buildings of the larger cities, in order to keep down the vermin that would gnaw holes in mail-sacks and destroy public records and other property. It is recognized in the national printing-office of France, where vast quantities of paper are stored, and where an army of cats is retained to keep the mice in check. In Vienna it is regarded as a part of good municipal government to take care of the cats. The United States government has systematized its cat service in public institutions, and in Pittsburg a certain strain has been bred to live in cold-storage houses, and is developing characteristics peculiar to this kind of life. In warehouses, corn-cribs, barns, mills, and wherever grain or food is stored, cats must be kept.

Having shown, to a limited extent, the necessity of keeping cats, we will now turn to the advance made in their care and selection; for the arousing of interest which has come from the scientific breeding of cats for exhibition purposes is destined to lift the family to its proper place in public economy, where the breeding and keeping of them can be properly regulated, their health cared for, the diseased put out of the way, and the family, as a whole, elevated to the position to which its beauty and usefulness entitle it. To be effective, they must be taken care of, for well-fed cats are the best mousers.

The origin of the domestic cat is shrouded in mystery, and to the Egyptians we have to turn for such of its early history as is reliable. The Egyptians being an agricultural people, and the raising of wheat their main industry, they quickly grasped the fact of the usefulness of the cat; and the earliest ones were probably obtained by taming kittens of the native species (*Felis caligata*), and to these we most likely owe the greater part of our short-haired cats. Possibly when the Aryans made their pilgrimage from Asia they brought specimens of the short-haired, domestic cats from India, for there are, at the present day in India, domestic cats that are not likely to have any Egyptian blood in their veins. Whatever the origin of the domestic cat, it is probable that in comparison to the date of the domestication of the horse, dog, ox, etc., the advent of the cat to our firesides is comparatively recent. Though cats appear on tombs, or as illustrations, as far back as 1600 B.C., this date may be said to be comparatively recent if we consider the question in relation to the probable date of the domestication of the dog. The Egyptians loved their cats, understood their usefulness, and ended by worshipping them as sacred animals, and giving them a careful burial, for the mummies of cats, beautifully wrapped in expensive fabrics, are constantly coming to light when excavations

EUROPEAN WILDCAT *(Felis Catus)*

Mau

are made in and around some of the buried cities of Egypt. The Greeks and Romans, about whom we have a clearer knowledge, and whose times seem to come nearer our own, appear not to have paid much attention to cats, and they have left us nothing in their literature, inscriptions, or paintings that leads us to any knowledge of the history of the domestic cat. There seems to be no record that the cat became domesticated in France or in England before the 9th century, but at that time it was considered of great value and was a regular object of trade.

American interest in the cat is often said to have originated within the last eight years, that is, since the advent of exhibitions and the taking up of the cat cult by the public. This impression is not borne out by facts, for we have exhibitors who have intimately studied cats, have bred and raised them, and have cared for them for over 50 years, and cat-shows were held in Maine between 1860 and 1870, even before the great exhibition instituted in London by the well-known animal painter, Harrison Weir, in the year 1871. But cat-shows in America were not known outside of Maine until one was held in the Madison Square Garden, New York, in 1895. The exhibitions in England have gone on from Mr. Weir's first show up to the present time, so that the marking epochs in modern cat history may be dated from the Crystal Palace show in 1871, and the New York show in April 1895. From these shows has arisen what may be described as a cult, or in some ways an industry. Numbers of individuals, principally women, have taken up the cat as a partial means of livelihood, selling those they rear by exhibiting them to the public, the outcome of which has been the production of different colors, strains, and families. Clubs have arisen for the care and maintenance of exhibitions; registers and stud-books have been started; and the importation of rare varieties or valuable specimens is duly recognized by our government as one of the many things to be considered and provided for in a tariff schedule.

The varieties or breeds recognized in shows are the Persian, Siamese, Abyssinian, and ordinary domestic short-haired cats. The Persian and Angora may be said to be the same cat, though distinctions were drawn in old days; but these were very indefinite, and at the present time we draw up rules and regulations for two large groups, the Long-haired Cats and the Short-haired Cats, and these are judged by points and classified by color distinctions. Angora is a small place, and comparatively few cats could have come from there, but many have come from other parts of Asia. Taking the long-haired division first, because commercially it is the most prominent, the judge requires that the cat shall be short in body with a short tail and short legs, the latter shorter in front than behind. The chest should be wide, the loin square and firm, the bones of the legs well developed, and the frame sturdy. The head that corresponds with this formation and is required, is a broad, round head with short, wide nose, eyes large and round, and set well apart. The ears, a most important feature, should be as small as possible and placed on the side of the head, the base of the ear being narrow, not gaping wide open, with a tuft of hair at the apex. This standard is more or less based upon original imported specimens from Asia; and if studied it will be found that the probable ancestor of our domestic long-hairs, *Felis manul*, or the wild long-haired cat of the interior of Asia, is built on these lines. The colors most valuable and most approved are the light silvers, smokes, blues (or slate color) white, black, orange, cream, and tortoise-shells; and the tabbies of different colors are also favorites. The tabby-cat is a cat that has a light ground-color and is spotted, barred or striped with darker color, and the word "tabby" has no reference to the sex of the animal. The name "tabbie" is derived from Atab, a street in Bagdad celebrated for its manufacture of watered or moiré silks, which in England were called *atabi* or "taffety." The most usual colors in tabby-cats are yellow, marked with orange or red, making what are called orange tabbies; yellow brown, marked with black, making the brown tabbies; gray, marked with darker stripes, giving us the gray tabbies; and pale silver, marked with black or a sort of dark blue verging on black, from which we have the silver tabbies. The great feature required in tabby-cats is that the ground-color should afford as distinct a contrast to the stripes, bars, or spots, as possible; the colors should be vivid and the marks very plain. There are spotted tabbies, and in these the spots must be round, clear, and distinct; but we seldom see a good one of this variety unless it came from India, the home of the best spotted tabbies. The solid-colored cats are the whites, blues, blacks, and smokes; although recently the silvers, creams, and oranges have in a few instances almost attained perfection in being without marks or foreign color. The tortoise-shell cats are black, red, and yellow; when accompanied by white, the patches are more clear and distinct, and this feature is what is aimed at. Tortoise-shell males are almost unknown, and orange females are very scarce.

The eyes of a cat are an important feature, and should be large, round, and pleasant in expression. Although color of eye is a great feature, many judges prefer large, well-placed, pleasant eyes to those that are more correct in color but badly placed, or are small and mean in expression, or give the cat a sour look. The color of eyes required may be briefly summed up as blue (as deep as possible) for a white cat; emerald-green for light silver, or chinchillas, as they have been called; and yellow to orange, as deep as possible, for all other varieties. The color and beauty of the cat's eyes vary according to the state of health, the light, and the time of day, and judges have to be careful in this matter. The body-colors can be defined as white, as pure as possible; black, deep and glossy; blue or slate, sound and pure from root to tip of hair, showing no light shadings or light under-color; smoke, a deep plum-color, silver undercoat; ruff, and stomach; cream, light fawn or cream color; orange, whether marked or unmarked, should be as rich and strong as possible. The tortoise-shells marked with clear distinct patches, clean-cut and free from each other. The fur of the long-haired cats should be fine, long, silky, and glossy; wooliness is deprecated, but is more inclined to appear in certain colors, such as orange and cream; and blacks may have a rather coarser texture of coat if they make it up in

color. But in whites, silvers, blues, smokes, and in brown tabbies there can be no excuse found for anything but exquisite quality.

In the short-haired division we must consider our old fireside friend first, and coloration in this variety is much the same as in the long-hairs, though we do not often find smokes or so many silvers, and the blue-eyed whites have probably been bred from the long-haired cats. But as to color, color of eyes, and classification, the rules specified for long-hairs fit the short-hairs except that the tabby-cats are more distinctly marked and more brilliant, as the colors are not clouded or mixed by the length of the hair. White cats with blue eyes are generally deaf, but not always. The short-haired cat is rather different in formation to the long-haired cat, the face is more angular, or rather the nose may come to a finer point, though its cheeks should be well developed. The eyes are differently placed, yet should be full and large, the ears larger, closer together, more toward the top of the head, wider at the base, and more pointed at the apex. The body should be moderately long, slender, and elegant. The great thing to avoid in all cats is coarseness, and size alone is not a recommendation.

The Siamese is a distinct variety which comes from the palace of the king of Siam or from a few families of nobles. These cats are conceded to be the most intelligent and companionable of all cats, but having been much inbred, are not easily reared and do not increase very fast. The climate of California suits the Siamese cat, and the variety is found there in fair numbers and doing well. The points valued in this cat are a rather small and flat head, a small and elegant body of a light fawn or biscuit color, with chocolate-colored legs, mask, and tail. The more decided the contrast — that is, the lighter the body color and the darker the points — the better. The Siamese are much appreciated as show-cats. Chocolate-colored cats of this variety are found and are valuable. The fur most approved is very fine and glossy, resembling beaver. The eyes are blue, the color as rich as possible.

The Manx cat makes a distinct species in our exhibitions, and is classed by itself. Besides the absence of tail, which is the distinguishing feature of this cat, a different formation of body is required; namely, that the fore legs should be short and the rump rise as abruptly as possible, making the hind legs longer than the fore legs, so that the cat seems to jump forward like a rabbit, and is sometimes called a rabbit-cat. The head should be neat, round, and rather small, and the cat itself small, short, and compact. The Manx cat may be of any of the recognized colors. There is a distinction between this variety and our other domestic cats. Gambier Bolton who studied the question, and traveled to collect specimens for the British Zoological Society, coincides with the naturalist Kempfer, and recognizes a strong likeness in these cats to those of the islands in the East, the Malay peninsula, Japan, China, and lands contiguous. All the cats in those parts, even the Siamese, seem to have peculiar formations of the tail, whether cut short, forked, kinked, or otherwise. These cats are smaller; there are differences in the call or language, ways, and character, that have been observed by these students. The origin of the Manx cat is now attributed to the arrival of these cats on the Isle of Man from ships belonging to the Spanish Armada that were wrecked there. These cats were most probably previously brought from Japan or other parts of eastern Asia, for cats now brought from Japan are exactly like our Manx. A cat with his tail cut off, showing a stump, does not constitute a Manx cat for the student.

Other cats found in show-rooms are the Abyssinians, but they do not make much headway and have not yet arrived in America. The males are generally darker than the females, and the color of these cats should be a deep brown ticked with black, somewhat resembling the back of a wild rabbit, with a distinct black band running down the back to the tip of the tail. The inner sides of the legs and belly are more of an orange tint than the body, and are marked in some cases with a few dark patches. The eyes are deep yellow, tinged with green; nose dark-red, edged with black; ears rather small, dark-brown, with black edges and tips; and the pads of the feet are black. Attempts have been made to copy this cat, and it has been attempted to exhibit, as such, slightly marked ordinary short-haired cats, but they are not the genuine breed. The absence of tabby-markings is the point most sought and prized, and if kept pure the characteristics of these cats are peculiar. The Abyssinian cat has never been very numerous at exhibitions, perhaps because it is a short-haired cat, though short-haired cats, when good exhibition specimens, bring large prices. Cats marked with white have not found much favor in British exhibitions, but have always been popular at American shows, and Madame Ronner, the great French painter of cats, usually depicts her cats — that is, the dark ones — with some white patches. If cats are marked with white, they are preferred with four white paws and a white face; that is, the white starting in a sharp point between the eyes, spreading out onto the lips, making a triangle with the apex on the forehead, and continuing thence down the chest, but not spreading to the shoulders or going round the neck or over the back. Any marking, in an "any other class," that is regular and even, and forms anything like a regular pattern, should be recognized and encouraged by a judge; besides which, any effort made to bring out a new variety or color must be taken note of and encouraged. There is now a tendency to encourage Dutch marked cats, which means black patches on the cheeks, a white blaze up the face, joining a broad, white belt which goes completely round the cat halfway between the ears and tail. Of the cats indigenous to the American continent, which might be suitable for domestication, few have been tried in a domestic way, and the species that inhabit this country are not many. I have seen the wild cat or gray lynx, at shows, behaving in the most exemplary manner. Having been brought up from infancy by children, and perfectly tame, it was more at ease in a large show-room, and not nearly as nervous as the ordinary feline. So that if it were not for the size of the creature, its possibilities as a domestic animal were certainly good; but unfortunately our time does not seem to be destined to take in hand or give us any fresh species of domesticated animal; what we have are handed

down through the ages. In this particular we are not original, for we destroy more often than we create, and we seem to have no time for trying to subdue or lead into bondage any new varieties of mammals. The puma, cougar, or mountain lion ranges over the whole of North and South America, but is too large for domestic purposes; yet it has never been aggressive against man, and, if history is to be thoroughly credited, was quite the reverse with early settlers till driven to exile and filled with fear by man himself. The ocelot is one of our most beautiful varieties, and varies somewhat in color, with sometimes a gray body-color, but more often yellow. It is clearly marked with dark color in spots, bars, and splotches, and is very handsome, but larger and more powerful than the domestic cat. These cats have been taken when young, and reared; and although comparatively tame and sociable till about a year old, they then become savage and impossible and have to be caged or killed.

A very pretty cat that has been exhibited in America is the margay from Central and South America, where it inhabits the woods. I have handled this cat at a show and found it very tame and with a passion for being caressed. The margay is light red or orange, beautifully and regularly spotted with small black spots, the ears small, round, and pointing forward, whitish-gray at the backs, edged with black. It is a small cat, very handsome and refined, and if the effort could be made to obtain some more of the species these cats would be a very valuable addition to our varieties and to our home circles. Geoffroy's cat is another small spotted cat, of which a few have been introduced into England, but it is too early to state what the future increase may be. The pampas cat is another feline not amenable to domestic life.

As a rule our best white cats with blue eyes come from India and some of the best are brought from Tibet. In crossing the Himalayan Mountains with these cats carriers slit their noses to enable them to breathe with greater ease the rarified atmosphere of the high altitudes. Cats with slit noses are much valued. As to cats coming from this place or that, such as Persia, Angora, etc., a good deal of proof is required before any particular claim can be accepted. I have failed to find any long-haired cats at Teheran, the capital of Persia, and Angora, as I have said, is but a small place. We probably obtained many of our long-haired cats from around the Persian Gulf, and more from India, many of which come down from the interior of Asia with the Arab horse-traders. Cats vary in their adaptability to changes of climate, and no doubt to this factor we owe what we have and what breeds we can retain and perpetuate. The Siamese soon succumbs to dampness, but the long-haired cats, in some cases, took to the climate of Maine early in the century, when brought from the East. They bred extensively, and increased and became an article of commerce to the large cities, long before these cities held shows. These cats went by the name of Angoras, and in fact the ordinary nomenclature of the country defines all long-haired cats as Angoras. The Maine cats were often carelessly bred, and when shows commenced and competition came they had to give way to the more finely bred English cats, but in other cases they held their own and the blood has been perpetuated. The Maine cats are found in all colors, and some are very big and strong, but these have been probably crossed with short-haired cats, and a great deal of hybridizing has been done even in England. There is a Russian long-haired cat, but it has not gained much favor, being solitary in its habits, unsociable in character, coarse in body and fur, and dingy in color. A few have been brought from Persia, but they had the faculty of attaching themselves more to other cats than to their owners. They are originally the same cat as the Asiatic,—that is, the Persian or Angora; and the first long-haired cats must have been brought over by sailors and travelers from the East. All long-haired cats seem to have a common origin in Pallas' cat (*Felis manul*).

Another cat that has created a great deal of interest is the Maltese. This cat is hard to account for, but should be blue or slate in color and greatly resembles what in Great Britain is called the Russian or Archangel cat, specimens of which have often been brought from Russia; but lately quite an influx of blue cats has come from Iceland. Whether cold winters are calculated to develop blue cats I do not know, but it is sufficiently evident that northern climates have produced most cats of that color. Blue cats are not numerous in Great Britain, although they are becoming more so by introduction. Here in America we have plenty scattered all over the States, but how they gained their name of Maltese I have never been able to discover, for there is no blue cat indigenous to the island of Malta. Probably the cats were brought there in early times from the same source whence the English now obtain theirs, and, the color being peculiar, these cats were selected, or by superior hardiness they may have selected themselves. However, many people who are not cat-exhibitors or who do not know much about cats scientifically keep their short-haired blue "Maltese" and are proud of them. The Chartreuse monks had blue long-haired cats many years ago.

Some writers have told us that long-haired cats are less affectionate than short-haired cats. This is a mistake, although long-haired cats, on the average, are more intense, more nervous, more highly strung, more pugilistic, and have more pluck and daring than the short-haired cats. The cat has great intelligence; in fact, is one of the most intelligent if not the most intelligent, of the domestic animals, and it is this fact that precludes the possibility of teaching the average cat tricks. For the cat sees through the manœuvre, and refuses to be made a fool of. In respect to memory they are phenomenal and far exceed the average dog in this quality. Their powers of conversation are well developed, accompanied by delicate inflexions of the voice that need to be known to be understood. Dupont de Nemours says: "The cat has also the advantage of a language in which the same vowels as those pronounced by the dog exist, with six consonants in addition, m, n, g, h, v, and f." It requires study to get to know cats, and Rouvière, the actor, said that no one could really understand a cat unless he himself became one. A cat, of all the domestic animals, has retained the greatest part of its wild nature and traits, and the easiest way to get at a cat is by kindness and by trying to learn cat ways.

A cat never gives in to coercion. Liberty is the last thing it will resign; and often it will not resign that except in exchange for death. The cat should be used as the emblem of liberty.

It is a mistake to suppose that a cat cares only for places, for it is only the innate conservatism of the animal that gives this impression. Regularity is the keynote of its existence and what it does one day it likes to do the next; and certainly to places where it has been reared and has lived it shows great attachment. But on the contrary there are cats that would settle down anywhere, that have crossed and recrossed the Atlantic Ocean, and have lived quietly in any locality their owners chose. A cat is one of the finest mothers on earth.

The fortunes of the cat are now more or less regulated by clubs and associations, and there are homes, hospitals, and refuges in many places and in many lands. The principal clubs are the National Cat Club founded in 1887, with headquarters in London; the Scottish Cat Club, founded in 1894; the Cat Club, London, founded in 1898; the Northern Counties Cat Club, the Silver and Smoke Persian Cat Society, the Siamese Club, and the Orange, Cream, Fawn, and Tortoise-shell, founded in 1900; the Black and White Club, the Blue Persian Society, the Chinchilla Cat Club, the Short-haired Cat Club, the Midland Counties Cat Club, the British Cat Club, and the Manx Cat Club, founded in 1901. All the above are in Great Britain, but many have members in America. In the United States there are the Beresford Cat Club, founded in 1899, with headquarters in Chicago; the Atlantic Cat Club, with headquarters in New York; the Chicago Cat Club, the Louisville Cat Club, the Pacific Cat Club, the Orange and Cream Society, with headquarters in Chicago, the Washington, D. C., Cat Club, the Detroit Club, etc. All these have been founded since 1899; so we can see that the advances made of late years have been sudden and rapid; and they will continue to grow; for shows are held in many of the principal cities and are yearly fixtures. The Chicago shows have brought together the largest number of cats, 259, at the show held in the Coliseum in January 1902. Prices for cats increase; and whereas $25 was considered a good price five or six years ago, some of the best have been recently sold for $250 each, and many at $75 and $100. The largest price of which we have record as having actually been paid in cash for a cat is $300, which was the price Lady Decies paid Mrs. Greenwood for Lord Southampton; although I expect to see this exceeded in time to come, for competition enhances values, and the best specimens and most perfect will bring high prices from those who want them. All this will tend to draw attention to the cat and better the race and its general conditions.

Cats have had their artists: the Egyptians, the Japanese, the Chinese, Salvator Rosa, Gottfried Mind ("The Raphael of Cats"), Burbank (a master little known), Cornelius Wisscher, the Dutch artist, whose "Tom" cat has become typical, J. J. Grandville, Harrison Weir, Louis Wain, Madame Ronner, and Adam.

Members of the English royal family breed and exhibit cats at the regular exhibitions of the present day. Cats now have their regular stud-books, and their ancestry is carefully tabulated. The oldest registry in America is the Beresford Cat Club Stud-Book in Chicago. Another has been started in Washington, called the United States Official Registry, but it is a private enterprise and has no direct connection with any government department. The two great registers in Great Britain are the National and the Cat Club stud-books.

A Few Hints to Breeders.—Do not try to keep too many; a good cat well reared will bring more money than 8 or 10 badly nurtured, undersized kittens. Cats are not gregarious, and when crowded together become diseased and mangy, and prematurely die. One litter of really good cats will give more pleasure and profit to the owner than five or six litters of poor ones.

Liberty is necessary to the health alike of the present and of the coming generations, and these latter should never be out of our minds when mating.

Meat is the main diet of all the *carnivora* to which order domestic cats belong. The best diet for cats is composed largely of meat, for which their teeth are adapted. Without meat they will not long remain healthy. They vary in their tastes, and what is fancied by one is not always preferred by another. Fish they are fond of, but as a rule house-cats should not be given much raw fish. Cats kept in confinement should have grass, vegetables, and changes of diet provided for them. Grass is a necessity.

Epidemics that sweep through different countries and continents at stated periods decimate the cat family, and it is well to be prepared for such occasions by having none but the healthiest and best of animals. Distemper, the greatest of cat scourges, is best treated by nursing, care, and cleanliness. Fleas convey embryonic worms which infest cats, and should be rigorously kept down. They breed in cracks in the floor, in bedding, and in the ground, and war waged upon their haunts will be work well laid out.

Do not use nauseating drugs for ailing cats, but choose the mildest remedies that will effect a cure. Do not be prejudiced against a course of treatment till you have tried it well; and remember that supposed cures suddenly made are not always effectual. Cats, when ill, require sympathy as much as human beings, and more so than any other animal, in order to battle successfully with disease, for they have a tendency to be very pessimistic and sorry for themselves, and to recover or fail quickly. They suffer mostly from distemper, worms, eczema, bronchitis, pneumonia, and liver diseases, and occasionally from catarrhal fever. If you are acquainted with a good homœopathic physician, and have any idea of what ails your cat, consult him and abide by his advice.

Do not breed from your queens too young, although many good kittens have been raised from queens not a year old, if strong and healthy. Male cats will not mate as early in life as the queens, and are seldom of much use till a year old. Do not cross long-haired cats with short-haired cats, for you spoil the type of both. Siamese cats will breed with other cats, but the progeny are never good for the showroom; and the Siamese being a distinct breed, does not amalgamate with any of the other varieties. The Manx cat is better kept pure, or

the type degenerates and the result is not satisfactory.

Remember, when trying to rear good cats, that what goes in at the mouth and the care bestowed upon the young and growing animals cover 50 or even 75 per cent of essential requirements. The best blood in the world will not bring prize-winners or nice pets if they are badly reared. The crucial period takes in the first six months; when the young cat is well grown, and at seven months of age is through teething, you will have an animal that may live 20 years or more. Healthy cats are more long-lived than dogs, and authentic records tell of not a few over 20 years of age, and of some even 30.

Kittens should not be taken away from their mothers before they are at least eight weeks old; and if three months old, it will be still better. Care should be exercised in the diet of kittens at an early age. Sudden changes or sudden chills will bring on gastritis. Milk, unless pure, is more dangerous than meat, which in a raw state may be given scraped or minced at a very early age. Milk is better when mixed with Robinson's prepared barley according to the directions on the box, unless you can obtain warm milk from a cow that has not been too long in milk. The most dangerous diet for highly bred kittens is cold skimmed milk of an uncertain age.

Ladies who know how to bring up children properly can best rear kittens, and the care needed for the former is necessary to the latter. Science is a great help, but it will not offset the want of the most elementary principles of care and common sense.

Young cats are liable to fits, either when teething or from worms. Cats, when young, sometimes have fits. Quiet coaxing and attention will bring a cat through a fit, or a dose of belladonna will ward one off. Ordinary smelling-salts held to the nose of the cat may give relief, but as soon as possible the cause should be sought. Cats do not have follicular mange, but their troubles come from the blood. Ringworm is common in the cat tribe; it is communicable at a very rapid rate and must be vigorously combatted.

To destroy a cat, or put it out of its misery when too sick to recover, administer a few drops of chloral, place the cat, if possible, in a tight box, and when the cat is fast asleep drop into the box a sponge saturated with two or three ounces of chloroform. Do not put a cat in a box with the chloroform before administering the chloral, for its struggles will be terrific. By the proper method the cat will glide out of existence without causing any trouble.

E. N. BARKER.

Cat-bird, one of two kinds of birds. (1) In North America a familiar songster (*Galeoscoptes carolinensis*) so called because of its mewing call-note, which is strikingly similar to the plaint of a kitten in distress. It is about nine inches long, and of a dark slate color, with a black cap, and a reddish patch under the tail. It is migratory only in the northern States, spends its winters in the South, and frequents bushy pastures and gardens. It has a brilliant and varied song, in which it seems to mimic the notes of other birds. Its four or five dark greenish-blue eggs are laid in bushes where it nests. In habit it is lively, familiar, and unsuspicious. It frequently attacks the common blacksnake, which, in the absence of the bird, rifles its nest. (2) In Australia, one of the bower-birds (*Ailurædus crassirostris*), so named named because of its cat-like call.

Cat-boat, a boat having one mast stepped just abaft the stem, and carrying a sail laced to a boom and gaff, resembling a schooner's mainsail. In general cat-boats are very broad in beam, averaging 1:3. They are usually equipped with a centre-board, which, with the extreme forward position of the mast, enables them to point high into the wind, and makes them remarkably quick in stays. They are principally employed as pleasure craft on the coasts and inland navigable waters of the United States, and are consequently of shallow draft.

Cat Island, one of the Bahama Islands, about 46 miles in length from north to south, and three to seven miles in its mean breadth. Pop. 3,000. This island was long identified with the Guanahani of Columbus, the first portion of land belonging to the New World on which he landed, 12 Oct. 1492. It is now thought by most that not this island but Watling Island, lying a little to the southeast, is the true Guanahani, and first landfall of Columbus.

Cat-owl, any of several widely distributed large owls, so called because of their feline habits and cat-like face. The best-known American cat-owl is the barred owl (*Syrnium nebulosum*), one of the largest birds of its kind, large specimens reaching 24 inches in length. It has no ear-tufts, and the general color is whitish, everywhere transversely barred with deep umber brown, except upon the abdomen, where the stripes run lengthwise. It is a lover of the woods, where its coughing cry resounds afar in the darkness, and where it breeds in hollows or among the branches of trees. It is not migratory, and often nests very early in the spring. This owl has the reputation of being especially destructive of poultry, but in truth it lives mainly on mice, of which it devours vast numbers each season, and hence is the benefactor rather than the marauder of the farm. Consult: Fisher, 'Hawks and Owls of the United States.'

Cat-shark, any of various members of the *Scylliorhinidæ*, a group of true sharks which are characterized by having two dorsal fins, the anterior of which is placed over or behind the ventrals, and by having the tail not bent upward. Some of these are called also "roussettes." The name cat-shark is also applied to the leopard-shark (*Triakis semifasciatus*).

Cat-snake, a small opisthoglyph (see OPISTHOGLYPHA) serpent (*Tarbophis vivax*) of Asia Minor and southeastern Europe. Its color is dull; it is sluggish in movement; and reaches

a length of three feet. It has long, recurved teeth in the lower jaw which serve to hold its prey (mainly lizards) until they are overcome by the snake's grooved poison-fangs. It is distinguished by being the only venomous snake of the opisthoglyph type in Europe.

Catabangenes. See CATUBANGANES.

Catacaos, kä-tä-kä'ōs, Peru, a city centrally situated in the maritime department of Piura, and on the Piura River. It is about 70 miles east of Piura, the capital of the department. Pop. 25,000.

Catachre'sis, a term used in rhetoric with a somewhat vague signification. It denotes any trope or figure of speech that is considered to be too violent. Thus any trope, whether a metaphor, an instance of metonymy, or any other, may become a catachresis if it is stretched too far. For example, the scriptural phrase "the blood of the grape" is often quoted as a case of catachresis, because it is thought too violent a metaphor to use "blood" for the blood-red juice of the grape.

Cat'aclysm, in geology, a physical catastrophe of great extent, supposed to have occurred at different periods, and to have been the efficient cause of various phenomena observed in the surface configuration of localities. The belief in cataclysmic movements as geological agents has largely given place to that in the working of ordinary agencies over long periods of time.

Cat'acombs, subterranean caves or vaults used as burial-places. All nations have been accustomed to some outward manifestation of regard for the dead, such as funeral solemnities, the consecration of grounds for sepulture, the erection of monuments, etc. Some nations, as the Egyptians, constructed pyramids and labyrinths to contain the remains of the departed. Others, as the Phœnicians and after them the Greeks, hollowed out the rocks for tombs, surrounding their towns with vast magazines, containing the bones of their fathers. Asia Minor, the coast of Africa, and Cyrenais, afford instances of these singular and gigantic works. The discovery of these monuments has always excited the curiosity of travelers and the attention of artists. The latter have applied themselves to learn from them the character of architecture and painting at different epochs; and though they have often found only coarse representations, the productions of art in its infancy or decline, they have occasionally met with types of perfection. Many monuments of this description have been preserved to our days, and still contain traces of the painting and architecture with which they were decorated. There are catacombs existing in Syria, Persia, and among the most ancient Oriental nations. But the revolutions in these countries, and the changes which they have occasioned, have deprived us of the documents which would have given us exact information regarding them.

The description of the catacombs in Upper Egypt gives us an idea of those whose existence is still unknown to us. They contain the history of the country, and the customs and manners of the people, painted or sculptured in many monuments of the most admirable preservation. The subterranean caves of these countries, like almost all of the kind, have their origin in quarries. From the depths of the mountains which contain them, stone was taken, which served for the building of the neighboring towns, and also of the great edifices and pyramids which ornament the land. They are dug in a mountain situated in the neighborhood of the Nile, and furnished the Romans with materials for the construction of buildings in their colonial establishments. The excavations in these mountains are found throughout a space of 15 to 20 leagues, and form subterraneous caverns which appear to be the work of art; but there is neither order nor symmetry in them. They contain vast and obscure apartments, low and irregular vaults, supported in different parts with piles left purposely by the workmen. Some holes, of about six feet in length and two feet wide, give rise to the conjecture that they were destined for sepulchres. Cells of very small dimensions, formed in the hollows of these obscure caverns, prove them to have been the abode of recluses.

In Sicily and Asia Minor a prodigious number of grottoes and excavations have been discovered containing sepulchres. Some appear to have served as retreats to the victims of despotism. The greater part are the work of the waters which traverse the mountains of these regions, as for instance the great cave of Noto, which passes for one of the wonders of Sicily. This cave, the height, length, and breadth of which are equal, has been formed by the Cassibili River, which runs at the bottom, and traverses it for the length of 100 fathoms. In the interior of this cave are a number of houses and tombs. At Gela, on the south coasts, there are abodes for the living and sepulchres for the dead, cut in the rocks; at Agrigentum subterraneous caves, labyrinths, and tombs, arranged with great order and symmetry. There are also caverns in the environs of Syracuse which may be ranked with the principal monuments of this description, from their extent and depth, their architectural ornaments, and from some historical recollections attached to them. The catacombs in the tufa mountains of Capo di Monte, near Naples, consist of subterraneous galleries, halls, rooms, basilicas, and rotundas, which extend to the distance of two Italian miles. Throughout there are seen niches for coffins (*loculi*) and bones. A description of them was given by Celano in 1643. They probably owe their origin to the quarries which afforded tufa for the walls of the cities Palæopolis and Neapolis, and afterward served as sepulchres for the Christian congregations.

The most numerous and extensive catacombs are those in the immediate neighborhood of Rome, at San Sebastiano, San Lorenzo, etc., the earliest of which of certain date belongs to the year 111 A.D. They are composed of interminable subterraneous galleries, extending underneath the town itself as well as the neighboring country, and are said to contain not less than 6,000,000 tombs. The name of catacombs, according to St. Gregory, was at first applied to designate exclusively the cave in which the bodies of St. Peter and St. Paul were buried, and it was only at a later period that it came to be given to all the subterraneous passages which were used as public burying-places. It is now regarded as certain that in times of persecution the early Christians frequently took refuge in the catacombs, in order to celebrate

there in secret the ceremonies of their religion; but it is not less certain that the catacombs served also as places of burial to the early Christians, and that in spite of the contrary opinion which prevailed for two centuries, and even down to our day, the catacombs were not for the most part abandoned quarries, but were excavated by the Christians themselves. It is found that originally the cemeteries of Rome were made up of separate tombs, which rich Christians constructed for themselves and their brethren, and which they held as private property under the protection of the law. But in course of time this was changed. At the end of the 2d century there existed certain cemeteries not the property of individuals but of the Church. Such was that which Pope Zephyrinus (202–19) intrusted to the superintendence of Calixtus, and which took its name from that bishop. Some years later, under Pope Fabian (236–51), there were already several such common burying-places belonging to the Christian congregations, and their number went on increasing till the time of Constantine, when the catacombs ceased to be used as burying-places. From the time of Constantine down to the 8th century they continued to be used as places of worship by the Christians, but during the siege of Rome by the Lombards they were in part destroyed, and soon became entirely inaccessible, so that they were forgotten. The first excavations in them were made by Antonio Bosio between 1560 and 1600. The results of these excavations were published in his 'Roma Sotterranea' (Rome, 1632), which was translated into Latin by P. Aringhi (Rome 1657). Among the more modern works on the subject may be mentioned: Rochette's 'Tableau des Catacombes de Rome' (Paris 1837); Perret's 'Les Catacombes de Rome' (Paris 1851–6); and 'La Roma Sotterranea Cristiana' by De Rossi (Rome 1864–77), containing the results of very careful investigations made by the author, who is justly regarded as the foremost student, in fact, father of this branch of archæology.

The catacombs of Paris, situated on the left bank of the Seine, are almost equally celebrated. The name itself, which has been given to this labyrinth of caverns and galleries from its resemblance to the asylums and places of refuge of the persecuted Christians under Naples and Rome, informs us of the purpose to which it has been applied since 1786. These galleries were originally the quarries from which materials were excavated for constructing the edifices of the capital. The weight of the superincumbent houses rendered it necessary to prop them; and when the cemeteries of the demolished churches and the burying-grounds were cleared in 1786, the government resolved to deposit the bones in these quarries, which were consecrated for that purpose. The first cemetery that was suppressed was the Cimetière des Innocents, and the bones from it were deposited beneath what is now Petit-Montrouge. The ossuary now extends much farther. The relics of 10 or more generations were here united in the repose of the grave. Many times as great as the living tide that rolls over this spot is its subterraneous population. By the light of wax tapers, a person may descend about 70 feet to a world of silence, over which the Parisian police keep watch as strictly as over the world of noise and confusion above. He will then enter a gallery where only two can go abreast. A black streak on the stones of the walls points out the way, which, from the great number of by-passages, it would be difficult for the visitor to retrace without this aid or without guides.

Among the curiosities here is a plan of the harbor of Mahon, which an ingenious soldier faithfully copied from memory, in the material of the quarries. Entering the hall, one is ushered into the realms of death by the inscription which once stood over the entrance to the churchyard of St. Sulpice: "*Has ultra metas requiescunt beatam spem exspectantes*" ("Beyond these bounds rest those awaiting the hope of bliss fulfilled"). Narrow passages between walls of skeletons; chambers in which monuments, altars, candelabra, constructed of human bones, with festoons of skulls and thigh-bones, interspersed occasionally with inscriptions, not always the most happily selected, from ancient and modern authors, excite the gloomy impression which is always produced, even in the most light-minded, by the sight of the dissolution of the human frame. Wearied of these horrible embellishments, the visitor enters a simple chapel, without bones, and containing an altar of granite. The inscription "D. M. II et III Septembr. MDCCXCII." recalls to memory the victims of the September massacres, whose remains are here united. On leaving these rooms, consecrated to death, where, however, the air is always preserved pure by means of air-holes, the visitor may pass to a geological cabinet, formed by Héricart de Thury, the director of the Carrières sous Paris. Specimens of the minerals furnished by the regions traversed, and a collection of diseased bones, in a contiguous hall, scientifically arranged, are the last curiosities which these excavations offer. More than 600 yards to the east of the road to Orleans the visitor finally returns to the light of day. Strangers may visit the catacombs in company with the government officials at the periodical visits. An account of these subterranean passages is that which was published by M. Dunkel in 1885.

The Etruscan tombs were not, strictly speaking, catacombs, yet as subterranean places of sepulture they may appropriately be referred to. They were usually hewn out of cliffs on the sides of a hill and were variously arranged, sometimes tier above tier and sometimes on a level. There was a central chamber with smaller ones opening from it. In the latter there were stone benches to receive the bodies of the dead.

Catacoustics, kăt-ą-koos'tĭks or -kows'tĭks, the science which treats of reflected sounds, or that part of acoustics which considers the properties of echoes.

Catafalque, kăt'ą fălk, an ornamental structure, in the form of a scaffolding or stage, for temporary use at ceremonious funerals. It is placed over the coffin containing a body lying in state, as in a church or other public edifice, and is sometimes used as a hearse, or set, as the representation of a tomb, over a grave.

Cat'alan, a native of Catalonia, or northeastern Spain, or the language of Catalonia, which holds a position similar to the provençal,

having been early cultivated, and boasting a considerable literature. It was established as a literary language by the close of the 13th century, and is still to some extent used as such in its own region.

Cat'alan, a blast furnace for reducing ores, extensively used in the north of Spain, particularly in the province of Catalonia. It consists of a four-sided cavity or hearth, which is always placed within a building and separated from the main wall thereof by a thinner interior wall, which in part constitutes one side of the furnace. The blast-pipe comes through the wall, and enters the fire through a twyer which slants downward. The bottom is formed of a refractory stone, which is renewable. The furnace has no chimneys. The blast is produced by means of a fall of water, usually from 22 to 27 feet high, through a rectangular tube, into a rectangular cistern below, to whose upper part the blast-pipe is connected, the water escaping through a pipe below. This apparatus is exterior to the building, and is said to afford a continuous blast of great regularity; the air, when it passes into the furnace, is, however, impregnated with moisture.

Catalan Grand Company, The, a name of a troop of adventurers raised by Roger di Flor about the beginning of the 14th century. Roger first gave his services to Frederick, king of Sicily, in his war with Robert, Duke of Calabria, but when peace was concluded between the two princes, being at a loss how to maintain his soldiers, he proposed to lead them to the East to contend against the Turks, who were then desolating the eastern empire. Andronicus, then emperor of the East, gladly accepted the offered assistance of Roger, and submitted to all the conditions which he imposed. Roger set sail from Messina, Sicily, in 1303, with 26 vessels partly equipped at his own expense. The number of the troops embarked with him is said to have amounted to about 8,000 men of different nations, Sicilians, Catalans, Aragonese, etc. The Catalans, either because they were the most numerous or for some other reason, gave their name to the whole company. On his arrival at Constantinople Roger was received with great rejoicings, and was elevated to the dignity of grand duke. A bloody affray between the Genoese and the Catalans marked the first period of the stay of these adventurers in Constantinople. Andronicus hastened to get them to cross over into Asia. This they did in the spring of 1304, and in the same year they defeated the Turks completely. In 1305 he took Ancyra, and forced the Turks to raise the siege of Philadelphia, but he was not so successful in his attempt to take Magnesia. After a long and ineffective siege he recrossed into Europe in 1306, bringing along with him his Catalans, who left behind them everywhere traces of their plunder and violence. When they had reached Europe they took up their quarters at Gallipoli. But Andronicus, who was by this time very anxious to be rid of his formidable allies, now received Roger with great coldness, and even obliged him to give up his title of grand duke in favor of Berengarius. The sudden departure of Berengarius, however, and the simultaneous incursions of the Turks into Asia Minor, compelled Andronicus again to appeal to Roger and his Catalans for assistance. Roger was raised to the dignity of Cæsar to appease him for the slights that had been put on him. But this only caused him to be regarded with more jealousy by the Greeks, and especially by Michael, the son of Andronicus, who was associated with his father in the empire. The result was that before he could start once more for Asia he was assassinated (1306 or 1307). The Catalans now turned their arms against the Byzantines, in order to avenge the death of their leader, and defeated them in several battles. They then passed into Greece and entered the service of the Duke of Athens, but no long time afterward they turned against him and defeated him in the battle of Cephissus (1311). They now became masters of Attica, where they maintained themselves for four years, when they were finally defeated by Philes near Bizyn (1315).

Catalanganes, kä-tä-län-gäns', a Malay people of Mongoloid type, living in the flood plain of the Catalangan River (province of Isabela, Luzon). They are heathen and peaceable, and speak the same language as the Irayas.

Catalani, Alfredo, äl-frā'dō kä-tä-lä'nē, Italian composer: b. Lucca 19 July 1854; d. Milan 7 Aug. 1893. He was graduated at the Paris Conservatory and settled in Milan, where he achieved fame with brilliant operas, especially 'Dejanice,' 'Loreley,' and 'La Wally.'

Catalani, Angel'ica, Italian singer: b Sinigaglia, most probably in 1782, although several other years are given; d. Paris 13 June 1849. As early as her 7th year her magnificent voice had become the subject of general remark, but it was not till the age of 14 that she received any instruction in the higher departments of the musical art. At 16 she was compelled by family misfortunes to turn her talents to account, and made her first appearance on the stage at Venice. She afterward filled the grand soprano parts at the operas of Milan, Florence, Rome, and Naples, and in 1799 accepted an engagement at the opera of Lisbon, where she continued for five years. She then visited successively Madrid, Paris, London, and the principal towns of Great Britain, in all of which her success and profits were immense. In 1814 she returned to Paris to take the management of the Italian opera there, but sustained thereby severe pecuniary losses from the injudicious interference of her husband, De Valabrégue, formerly a captain in the French army. On Napoleon's return in 1815 she was obliged to resign the direction of the opera, but resumed it again on the second restoration. In 1818 she again resigned the direction of the opera, and from that year till 1828 made repeated professional tours through the Continent and Great Britain. In 1830 she retired from public life to a villa in the neighborhood of Florence, and here she resided with her family and gave instruction to girls who manifested indications of local talent, one condition being required from them that they should adopt the name of Catalani. She was a woman of majestic appearance, and her voice displayed a wonderful degree of power, flexibility, and compass. She rather, however, astonished and overpowered an audience than touched or subdued their hearts by her marvelous execution.

Catalau'nian Plain, the wide plain around Châlons-sur-Marne, in France, famous as the field where Aëtius, the Roman general, and Theodoric, king of the West Goths, gained a complete victory over Attila and the Huns, 451 A.D.

Cataldo, kā-tăl'dō, **St.,** Italy, a town in the province of Caltanissetta, five miles west-southwest of the town of Caltanissetta. The sulphur works in the environs produce annually about 1,875 long tons. Pop. 12,800.

Cat'alepsy, a peculiar motor phenomenon, not a disease, that is found in a number of nervous disorders. It consists of a persistent muscular attitude of some part of the body, and may or may not be attended by unconsciousness. Thus a person may place the right arm or leg, or another may so place the limb, in a peculiar, or awkward, or in fact any position. This position is maintained by the patient for a very long time, usually a time much longer than a normal individual could maintain it. Almost any muscle group may be involved. The patients may squat on the floor, or stand on one leg for hours, or hold both arms in the air almost all day. There seems to be some form of muscle anæsthesia and the position of the limb seems to be unknown and unfelt by the patient. This symptom is very frequent in cases of true hysteria, and it is also found in a number of other affections that cluster about hysteria. Thus it is present in somnambulism, in hypnosis, in a peculiar mental state known as catatonia, and in stuporous melancholia,—all of which have much in common, being affections superimposed on the hysterical nervous organization, a type of make-up of a character, whose main features are assuming a definite recognition by students of the functions of the nervous system. See Janet, 'Mental State of Hystericals'; Raymond, 'Obsessions et Psychasthenies'; Starr, 'Text-Book of Nervous Diseases.' See HYSTERIA.

Cataloguing. See LIBRARY.

Catalo'nia, Spain, an old province (ancient TARRACONENSIS), bounded north by France, east by the Mediterranean, south by Valencia, and west by Aragon; area, 12,480 square miles. The country in general is mountainous, but intersected with fertile valleys, while the mountains themselves are covered with valuable woods and fruit-trees, as the slopes are plentifully supplied with water by an artificial system of irrigation. The main river of Catalonia is the Ebro; there are also the Segre, Ter, Llobregat, and many smaller rivers. Corn, wine, oil, flax, hemp, legumes, and almost every kind of fruit, are abundant. There are also quarries of marble of all colors, of crystal and alabaster; mines of lead, tin, iron, alum, vitriol, and salt, and formerly of gold and silver. On the coast is a coral-fishery. Catalonia is naturally much less fertile than either of the Castiles; but it surpasses every other province in Spain in the industry and intelligence of its inhabitants, and the improvements which have been effected in manufactures, agriculture, and commerce. It comprises the modern provinces of Tarragona, Gerona, Lerida, and Barcelona. The principal towns are Barcelona, Tortosa, Tarragona, Gerona, Manresa, and Lerida. Pop. 1,980,000.

Catal'pa, a genus of deciduous trees of the natural order *Bignoniaceæ*. There are about eight species, all natives of the northern hemisphere, four being hardy in cool temperate climates. They are all ornamental because of their large, bright-green leaves and conspicuous panicles of large, two-lipped, bell-shaped, white or yellowish flowers followed by long pods which persist until spring. Several of the species are highly esteemed for their timber, which is especially valued as fence-posts and railwayties because of their durability when in contact with the soil. For this reason they are frequently planted, especially *C. speciosa,* which is one of the hardiest. They are easily propagated by seeds sown in spring or by ripewood cuttings, and they succeed well upon moist loams from New England southward. A leaf-spot disease, *Phyllosticta catalpæ,* which sometimes attacks the foliage, may be controlled with anv standard fungicide (q.v.).

Catalyt'ic Action, Catalysis, or **Catalysm.** When chemical decomposition is brought about in any compound, and its ingredients are made to enter into new combinations in consequence of the introduction of another body, which does not itself form a part of any of these combinations, nor lose either of its constituents, but acts in some manner not understood, apparently by its mere presence or contact, to excite this chemical action, the force is called by Berzelius catalytic. A small quantity of yeast thus acts to cause a mixture of sugar and water to ferment, and form the new combinations of carbonic acid and alcohol; the addition of $\frac{1}{100}$ part of oxalic acid to boiling syrup of sugar, causes it to become fluid as water, and refuse to crystallize. Liebig objected to this introduction of a new theoretical force, which does not actually explain the phenomenon by giving it a name, but tends to satisfy the understanding with a plausible explanation, and thus hinder further research.

Catamaran, kăt'a-ma-răn, a sort of raft used in the East Indies, Brazil, and elsewhere. Those of the island of Ceylon, Madras, and other parts of the Indian coast, are formed of three logs. The timber preferred for their construction is the dup-wood or *cherne-maram,* the pine-varnish tree. Their length is from 20 to 25 feet, and breadth 2½ to 3½ feet. The logs of which they are constructed are secured together by means of three spreaders and cross lashings through small holes. The centre log is much the largest, and is pointed at the fore end. These floats are navigated with great skill by one or two men in a kneeling posture. They think nothing of passing through the surf which lashes the beach at Madras, and at other parts of these coasts, when even the boats of the country could not live upon the waves, and they are also propelled out to the shipping at anchor when boats of the best construction would be swamped. In the monsoons, when a sail can be got on them, a small outrigger is placed at the end of two poles as a balance, with a bamboo mast and yard, and a mat or cotton-cloth sail.

Catamarca, kä-tä-mär'cä, Argentine Republic, a province, bounded north by Salta, east by Tucuman and Santiago del Estero, south by Cordova and Rioja, and west by Rioja and Chile; area, about 47,530 square miles. The

surface is very mountainous in parts, except the southern, where it stretches out into a large plain. The loftiest and best known of the mountains is the Sierra de Aconquija, which stretches from south to north, and attains in its culminating point near its southern extremity a height of more than 16,000 feet. The Santa Maria, flowing north to the Huachipas, is the only river of any importance, but as every valley has its mountain stream, the whole province is well watered. The soil is fertile, producing large crops of maize and wheat, and supporting large numbers of live stock, especially goats. The vine is also cultivated, and yields wine and spirits which bear a high name in the surrounding countries. The principal exports are beasts of burden, horned cattle, and hides and goatskins, raw or tanned. The principal mineral is iron, but gold, silver, and lead are also found. The capital is Catamarca. Pop. 99,000, chiefly of Indian extraction, with a considerable mixture of Spaniards.

Catamarca, Argentine Republic, the capital of the province of Catamarca, situated in a valley 82 miles northeast of Rioja. It is connected by rail with Rioja and all the chief towns of the republic, and is the trade centre of a fertile district. It was founded about 1680, and has a fine church and a college. Pop. 7,500.

Catamount, a short form of the phrase "cat of the mountain," frequently found in the older books about America, and still occasionally used as a name for the lynx of the eastern United States, and sometimes for the puma, or "panther," once common in New England. The term is so indefinite that it is well that it has fallen into disuse.

Catanduanes, kä-tän-dwä'nēz, Philippines, an island lying northeast of the province of Albay, Luzon; its length is 44 miles north and south; width, 29 miles at the southern end; area, 704 square miles. The mountain system consists of three ranges that radiate from Mount Catilamong near the centre of the island; the rest of the surface is irregular, covered with low hills. The most important rivers are the Ocó and the Bató or Cabugao; there are also a number of smaller rivers, and the island is well watered. The soil is fertile, and rice, cotton, corn, and hemp are raised; indigo and cocoanuts are exported. The natives find gold, both dust and nuggets, in the gravel beds of many of the rivers. The largest town is Birac (pop. 5,832). The island does not form a province of itself, but is a constituent part of the province of Albay, and is included in the military department of Luzon. Pop. 33,300.

Cata'nia (ancient CATANA), Italy, a city of Sicily, in the province of Catania, on the borders of the valley of Noto, the see of a bishop, the suffragan of Monreal; 47 miles south-southwest of Messina, 85 east-southeast of Palermo. It is situated on a gulf of the Mediterranean, at the foot of Mount Ætna. This city has been repeatedly visited by violent earthquakes, and partially laid in ruins by lava from eruptions of Mount Ætna. The most disastrous eruption was that of 1669, by which many of the antiquities of Catania were overwhelmed, and the worst earthquake was that of 1693, when 18,000 people were destroyed. Although again greatly injured by the earthquake of 1783, Catania is now reviving with great splendor, and has much more the features of a metropolis than Palermo. The principal streets are wide and well paved with lava. Most of the edifices have an air of magnificence unknown in other parts of the island, and the town has a title to rank among the elegant cities of Europe. An obelisk of red granite, placed on the back of an antique elephant of touchstone, stands in the centre of the great square, which is formed by the town hall, seminary, and cathedral. The cathedral, a fine building, was founded in 1091 by Count Roger, but required to be mostly rebuilt after the earthquake of 1693. It is dedicated to St. Agatha, the patroness of the city. The suppressed Benedictine monastery of St. Nicholas, comprising a church (with splendid organ), library, museum, and other extensive buildings, was long celebrated for wealth and splendor. The university was founded about 1445. The ruins of the amphitheatre, which was more extensive than the Coliseum at Rome, are still to be seen, as also the remains of the theatre, baths, aqueducts, sepulchral chambers, hippodrome, and several temples. The industries include the manufacture of silk and cotton goods, and the mining of sulphur. The harbor was formerly a good one, but by the eruption of 1669 its entrance was almost entirely choked up, and it is only in recent times that it has been improved, a considerable amount of money having been spent on it. The trade of Catania is of some importance, the principal export being sulphur, next to which come oranges and lemons, almonds and other fruits, and wine. Cereals, textiles, and other manufactures are the chief imports. The exports have an average annual value of about $5,000,000. A circular railway runs from Catania round the base of Mount Ætna. Pop. 147,000.

Catanzaro, kä-tän-zä'rō (ancient CATACIUM), Italy, a city and capital of the southern province of the same name, on a height, eight miles from the Gulf of Squillace. It suffered severely from the great earthquake of 1783, but is still a place of some importance, defended by a citadel, and containing a cathedral and various other churches, an academy of sciences, one of the four great civil courts of the kingdom, a lyceum, and three hospitals. The manufactures consist chiefly of silk and velvet, and there is some trade in wheat, wine, oil, etc. Pop. about 30,000.

Cataphoresis, kăt-a fôr-ē-sĭs, a method of introducing remedies into the body by means of electricity. While certain substances can be made to penetrate the skin by means of electrical currents, the general cataphoretic method has not found favor with conservative and careful observers.

Cataphrac'ti, a group of fishes known also as "mailed-cheeked," characterized by having a bridge-like bone running from below the eye to the gill covers. The group includes the rockfishes, scorpion-fishes, sculpins, sea-poachers, lump-suckers, and sea-snails. Most of these live in the sea, but in North America there are several species of sculpins which dwell in freshwater streams and lakes, and are known as mullets. The names *Loricati* and *Parcioplitcæ* are also applied to this group. Consult: Jordan and Evermann, 'Fishes of North and Middle America.'

Cat'aplasm, or **Poultice,** some kind of soft compound intended to be applied hot to the surface of the body. Poultices are commonly made of linseed-meal, oatmeal, bran, bread crumbs, etc., mixed with water, milk, or some other liquid. They are called sinapisms, or mustard poultices, when mustard forms their base.

Cat'apult (Latin, *catapulta;* Greek *καταπέλτης*), a name for certain machines of the ancients for projecting missiles, chiefly arrows. *Ballistæ* (Greek, *πέτροβολοι* or *λίθοβολοι*), were engines somewhat similarly constructed, but were chiefly confined to the shooting of stones. *Tormentum* was a general name for all such machines. Catapults may be described as gigantic cross-bows, the most powerful of which consisted, not of a single beam or spring, but of two, inserted each into an upright coil of ropes, so twisted that the ends of the arms could not be drawn toward each other without producing a most violent recoil. These machines were described by the length of the arrow they were constructed to launch; thus there were three-span, two-ell, and other catapults. A three-ell catapult (*τριπήχυς*) weighed 588 pounds, the arrow fully 4 pounds, and five men were required to work it. The effective range was about 1,200 feet. The missiles used in *ballistæ* varied in weight from 15 to 90 pounds. The Romans did not carry all the parts of these machines with them, but only the ropes and fastenings, with the necessary tools; and the soldiers built the catapults when they wanted them. They were chiefly used in siege operations. The terms *catapulta* and *ballista* were often used indiscriminately; and in later times the word *catapulta* went entirely out of use. Vegetius and Ammianus Marcellinus never introduce it, and employ *ballistæ* to signify all machines throwing large arrows or beams, and *onager* for those throwing stones. The catapult used by schoolboys generally consists of a y-shaped stick, to the arms of which are attached strong elastic bands united in the middle by a piece of soft leather. A small stone or a few shot are placed in the leather, which is then pulled back and suddenly released, the elasticity of the bands projecting the missile to a considerable distance. It is often used against small birds. See ORDNANCE.

Cat'aract, in medicine, an opacity of the crystalline lens of the eye, or of its capsule, or both. It is quite different from amaurosis, which is a disease of the retina, by which it is rendered unsusceptible to the action of light. In cataract the lens becomes opaque, loses its transparency, and is no longer capable of transmitting the light. The causes of cataract are numerous. Inflammation or injury to the lens may produce it. Sometimes it is ascribed to a state of the vessels of the part which prevents a proper nourishment of the lens or its capsule. It is produced by various diseases, such as gout, rheumatism, diabetes, or scrofula, and often accompanies old age. Sometimes children are born with cataract. Its earliest approach is marked by a loss of the natural color of the pupil; this becoming turbid or slightly gray. *Muscæ volitantes* accompany this period. The opacity is not at first over the whole lens, but most frequently first attacks the centre portion; this being turbid and of a grayish color, while the surrounding portions remain transparent and of the usual black color. While it exists in this degree only, the person can see in an oblique direction. The color of the pupil is various; mostly grayish-white or pearl-colored; sometimes milk-white, or of a yellowish-gray; now and then of a grayish-brown, and even of a dark brown or dark gray. The consistence of the lens differs in different cases, being either hard and even horny, or very soft, as if dissolved.

The treatment of cataract is by a surgical operation on the eye, and different operations have been tried and recommended. They all consist in removing the diseased lens from its situation opposite the transparent cornea. By one of these operations the cataract is depressed, removed downward, and kept from rising by the vitreous humor. This is called couching. Another operation is extraction, and consists in making an incision of the cornea and of the capsule of the lens, by which the lens may be brought forward and through the cut in the cornea. The third operation is by absorption. This consists in wounding the capsule, breaking down the crystalline, and bringing the fragments into the anterior chamber of the eye, where they are exposed to the action of the aqueous humor, and are at length absorbed. This last operation has the name *keratonyxis* applied to it, and is chiefly employed in the case of children, because the lenses of their eyes are soft. The choice of the operation is determined by the character of the cataract. After the operation the patient is to be kept from the light, and from all means of irritation.

Cat'aracts (from Latin, *Cataracta,* a "waterfall"), one of the names given to sudden descents in streams of water, the more general English term being fall or falls. A considerable declivity in the bed of a river produces rapids. When it shoots over a precipice it forms a cataract. If it falls from steep to steep, in successive cataracts, it is often called a cascade. In rocky countries rivers abound in falls and rapids. In alluvial districts, falls, of course, are very rare. Rapids and cataracts are often a blessing to rugged countries, since they furnish the cheapest means of driving machines in manufactories, etc. In recent times waterfalls have been utilized in the furnishing of electric power in addition to ordinary water-power. Many cataracts are remarkable for their sublimity, the grandest known being Niagara Falls (q.v.), on the Niagara River, between lakes Erie and Ontario. Some others of note are mentioned below.

The Montmorency River, which joins the St. Lawrence a few miles below Quebec, forms a magnificent cataract, 250 feet high. The Missouri, in the upper part of its course, descends 357 feet in 16½ miles. There are four cataracts, one of 87, one of 19, one of 47, and one of 26 feet high. The Yosemite River in California forms a series of magnificent falls, with a total descent of 2,600 feet. The first of them is a plunge of 1,500 feet, and is followed, after a series of beautiful cascades, by a final plunge of about 400 feet. Fully 200 miles from the mouth of the Hamilton River in Labrador there is a magnificent series of cataracts known as the Grand Falls, the largest having a height of over 300 feet. In Colombia, South America, a great cataract, that of Tequendama, is formed by the Bogotá River. The river precipitates itself through a narrow chasm, about 36 feet broad, to the depth of over 600 feet. On the Potaro

River in British Guiana, the Kaieteur Fall, 740 feet high, and about 370 broad, is a splendid spectacle, and just below it is a second fall of 88 feet.

The most remarkable waterfall of Africa is one with which Dr. Livingstone's missionary travels first made us acquainted. This is a cataract on the Zambesi, called by the natives Mosioatunya ("smoke sounds here"), named by him Victoria Falls. The stream, about 1,860 yards broad, flowing over a bed of basaltic rock, is suddenly precipitated into a tremendous fissure, extending across the bed of the river from the right to the left bank, to the depth of about 370 feet. The breadth of this fissure or crack is only from 80 to 90 yards, and the pent-up waters, from which immense columns of vapor are continually ascending, are then hurried through a prolongation of the chasm to the left with furious violence. The so-called Cataracts of the Nile are not, properly speaking, cataracts. A more correct designation for them would be "rapids." The Stanley Falls on the Congo comprise seven cataracts. On the Tugela River in Natal there are the Tugela Falls. On the Umgeni River, in the same country, are the falls of the Great Umgeni (364 feet) and the Kar Kloof Falls (350). There seem to be no waterfalls of more note in Asia than those of the Cavery River of India.

One of the grandest falls in Europe is that of the Ruikanfoss ("smoking fall"), on the Maan River in Norway. The height of the cataract is 805 feet. In Sweden, on the Gotha River, a few miles below its outlet from Lake Wener, are the celebrated falls of Trollhätta, which have a height of over 100 feet. The cascade of Gavarnie, in the Pyrenees, is reputed the loftiest in Europe, being over 1,300 feet high. Its volume of water, however, is so small that it is converted into spray before reaching the bottom of the fall. Another waterfall in the Pyrenees is that of Seculéjo, in the neighborhood of Bagnères-de-Luchon. It ascends from the Lac d'Espingo, into the Lac de Seculéjo, or d'Oo, a singularly romantic mountain reservoir, from a height of 820 feet, and is the most copious of the Pyrenean waterfalls. The Swiss Alps likewise contain some falls of great sublimity. At Lauterbrunnen, in addition to numerous other cascades, is the renowned fall of the Staubbach, about 870 feet high, which, however, from its small volume of water, has none of the terrific adjuncts of a cataract, and resembles, in front, a beautiful lace veil suspended from the summit of the precipice. Near Martigny is the picturesque waterfall of the Sellesche or Pissevache, the final leap of the cascade being 128 feet. The falls of the Rhine at Schaffhausen are renowned over Europe. They are 300 feet broad, and nearly 100 feet high. In Italy the falls of Terni, or the Cascate del Marmore on the Velino, have been immortalized by Lord Byron, and though artificial, are justly regarded as among the finest and most picturesque in Europe. They consist of three falls, the aggregate height of which may be estimated at 550 feet. The falls of the Anio or Teverone, at Tivoli, are likewise very beautiful. They, too, are artificial, and have a fall of about 80 feet.

Catarman, kä-tär-män', Philippines, a town on the north coast of the Island of Samar, situated on the Catarman River, 55 miles northeast of Catbalogan. It has a good anchorage ground. In 1871 the town was destroyed by a volcano which burst forth in July from low land on the west side of island, and in two months had thrown up a hill two thirds of a mile long, one third of a mile wide, and about 450 feet high, destroying all vegetation for miles around. At the time of the visit of the Challenger, January 1875, the volcano had attained height of 1,950 feet, and was still active, there being visible columns of smoke by day and series of small fires at its summit by night. Pop. 10,482.

Catarrh, ka-tär', a flow from a mucous membrane. It is a symptom purely, and not a disease, and any mucous membrane of the body may be affected by an acute or chronic inflammation, usually entitled an acute or chronic catarrh; as, catarrh of the nasal mucous membrane, of the pharynx, larynx, stomach, intestines, rectum, bladder, vagina, etc. The word has general significance only, but it is much used by vendors of nostrums. See NOSE AND THROAT.

Cataw'ba, Wateree', or **Santee',** a river rising in the Blue Mountains, N. C., near Morgantown. It runs east and then south into South Carolina, where it is known for some distance as the Wateree, but after the confluence of the Broad River, it takes the name of Santee, then runs east by south, and after a course of 270 miles falls by two mouths into the sea between Charleston and Georgetown. This river gives its name to a wine, the grape from which it is made having been first discovered near its sources.

Cataw'ba, a light sparkling wine, of rich Muscatine flavor, produced in several parts of the United States. It is made from the Catawba grape, first found growing on the banks of the Catawba River in the Carolinas. This wine is now in extensive use, and is gradually superseding Rhenish and French sparkling wines, to which, in general character, it bears a resemblance. See WINES.

Catbalogan, kat-bä-lō-gän, Philippines, capital of the province of Sámar, situated on a small bay at the mouth of the Antigas River on the west coast. It is protected by a number of islands, Daram being the largest. The anchorage ground is not safe during the monsoon weather; Parasan Island Bay, 10 miles west, is then the refuge for vessels. The town has a large trade in hemp and cocoanut-oil with Manila, and steamers from Manila call every two weeks. Pop. 6,459.

Catch, a short piece of music written generally in three or four parts. It is a sort of short canon, the second voice taking up the theme when the first has completed the first phrase, the third following the second in same manner. These compositions are most frequently of a humorous and bacchanalian character, and have been from Purcell's time very popular in England.

Catch'fly, any one of several plants of various genera. The name is perhaps most commonly applied to species of *Silene* of the natural order *Caryophyllaceæ*, since their calyces and stems exude a clammy, sticky substance which attracts flies and holds and kills those that alight. Certain species of *Lychnis*, especially *L. viscaria*, a closely related genus, are also popularly called by this name. Sometimes,

too, the Venus flytrap is called Carolina catch-fly. See CARNIVOROUS PLANTS; LYCHNIS; SILENE.

Cateau, kă-tō, **Le,** or **Cateau-Cambrésis,** kăn-brä-zē, France, a town in the department of Nord, on the right bank of the Selle, 15 miles east-southeast of Cambrai. It was once fortified, though now open, and is famous for the treaty of its name signed here in 1559, by which Henri II. of France gave up Calais to the English; and agreed to abandon all he had conquered from Spain on condition that that country would do the like with her French conquests. Altogether France lost 189 fortified towns by the treaty. Le Cateau has manufactures of cotton, wool, merinos, cambric shawls, and a considerable trade in them, and in wine, iron, coal, and agricultural products in general. Pop. 10,500.

Catechesis, kăt-ē-kē'sĭs, the science which teaches the proper method of instructing beginners in the principles of the Christian religion by question and answer, which is called the catechetical method. Hence catechist and catechize. The art of the catechist consists in being able to elicit and develop the ideas of the youthful mind. This part of religious science was first cultivated in modern times, and Rosenmüller, Daub, Winter, Heinrich, Müller, Schwarz, Palmer, and others, have particularly distinguished themselves by their writings upon it.

Catechetical (kăt-ē-kĕt'ĭ-kăl) **Schools,** institutions for the elementary education of Christian teachers, of which there were many in the Eastern Church from the 2d to the 5th century. They were different from catechumenical schools, which were attached to almost every church, and which were intended only for the popular instruction of proselytes and children; whereas the catechetical schools were intended to communicate a scientific knowledge of Christianity. The first and most renowned was established about the middle of the 2d century, for the Egyptian Church at Alexandria, on the model of the famous schools of Grecian learning in that place. (See ALEXANDRIAN AGE.) Teachers like Pantænus, Clement, and Origen gave them splendor and secured their permanence. They combined instruction in rhetoric, oratory, and music, in classical Grecian literature, and the Eclectic philosophy, with the principal branches of theological study, exegesis, the doctrines of religion, and the traditions of the Church; distinguished the popular religious belief from the *Gnosis,* or the thorough knowledge of religion; established Christian theology as a science, and finally attacked the dreams of the Chiliasts (believers in a millennium); but by blending Greek speculations and Gnostic phantasies with the doctrines of the Church, and by an allegorical interpretation of the Bible, contributed to the introduction of heresies. The distraction of the Alexandrian Church by the Arian controversies proved the destruction of the catechetical schools in that place about the middle of the 4th century. The catechetical school at Antioch appears not to have been a permanent institution like the Alexandrian, but only to have been formed around distinguished teachers, when there happened to be any in the place. There were some distinguished teachers in Antioch about the year 220. We have no certain information, however, of the theological teachers in that place, such as Lucian, Diodorus of Tarsus, and Theodore of Mopsuestia, until the latter part of the 4th century. These teachers were distinguished from the Alexandrian by more sober views of Christianity, by confining themselves to the literal interpretation of the Bible, by a cautious use of the types of the Old Testament, and by a bolder discussion of doctrines. The Nestorian and Eutychian controversies, in the 5th century, drew after them the ruin of the schools at Antioch. Of a similar character were the schools instituted at Edessa in the 3d century, and destroyed in 489, and the school afterward established at Nisibis, by the Nestorians, in its stead; both of which were in Mesopotamia. To these schools succeeded, at a later date, the cathedral and monastic schools, especially among the western Christians, who, as late as the 6th century, made use of the heathen schools, and had never established catechetical schools even at Rome.

Cat'echism, a form of instruction by question and answer, especially instruction in Christian doctrine by that method; and not the instruction only, but the book in which the questions and answers are contained. The Catechetical school of Alexandria was an institution designed to instruct pagans in the doctrines of the Christian Church (2d century). Its founder, Pantenos, was a Greek convert deeply learned in the Grecian philosophy and in the Hebrew Scriptures. Among his disciples was Titus Flavius Clemens, who became his successor as head of the school; and to Clemens (Clement of Alexandria) succeeded the illustrious Origen, who, at the early age of 18, was deemed worthy to be named to so responsible a post.

The catechetical instruction given by these masters of the Alexandrine school was conveyed rather in the form of lectures than in that of question and answer. The more familiar instruction given to catechumens in the early Church was of the same nature, but more simple and elementary. In the latter half of the 4th century St. Cyril, bishop of Jerusalem, composed 23 lectures, or in Greek *katacheseis,* of which 18 were addressed to postulants for baptism (catechumens) and five to the neophytes after their baptism. These latter he called mystagogic catacheses, or instruction in the mysteries of Christianity. They are of a more popular character than the catacheses of the Alexandrines, and are believed to be the first example of a popular compendium of the Christian doctrines.

In the Roman Catholic Church the Catechism of the Council of Trent, or Roman Catechism or *Catechismus ad Parochos* (Catechism for Parish Priests) is addressed especially to pastors and others having cure of souls, suggesting to them the manner of expounding Christian doctrine and of enforcing the precepts of Christian morality in their sermons from the pulpit and in conveying religious instruction to the young. It is also designed as a basis and model in composing short expositions of Christian doctrine for popular use among the laity. The Catechism of the Council of Trent was first published in 1566 in Latin, and formed a considerable volume, 500 pages 8vo. A decree of the Council of Trent ordered all bishops to "take care to have the Catechism faithfully translated into the vernacular language and expounded to the people by all pastors." Translations were accordingly

made into Italian, French, Spanish, and German. The first English translation was not published till 1829. It is a large octavo, closely printed, of over 400 pages. The work possesses high authority, but not the highest; it does not rank with the creeds of the Church or with the canons and decrees of councils or the dogmatic definitions of Popes.

All the principal divisions of Protestantism — the Anglican Church and its offshoots, the Lutheran and Calvinistic churches, the Presbyterians, Methodists, and Baptists — have catechisms. Many of these Protestant catechisms, as the Catechism of Luther, the Calvinist of Geneva, the Westminster Larger and Shorter catechisms, the Catechism of the Church of England, possess in their several churches an authority equal or comparable to that of their several creeds or confessions of faith.

Catechist. See CATECHISM.

Cat'echu, an earthy or resin-like substance, used in dyeing and calico-printing, and in medicine as an astringent. It is obtained by boiling the leaves, wood, and fruit of certain plants growing in India and other eastern countries (notably the *Acacia catechu*), and concentrating the extract by evaporation until it will solidify. Catechu (known also in the trade as "cutch") consists mainly of catechu-tannic acid, which is soluble in cold water, and catechin, which is insoluble in cold water, but soluble in hot water. In medicine catechu is of service because of the tannin that it contains. It acts as an astringent and is serviceable in diarrhœa and dysentery. Catechu is also used in lozenges for affections of the mouth and throat.

Catechumen, a person who is under instruction and probation preparatory to admission to membership in the Christian Church through baptism. On the day of Pentecost and in the early days of the Church's mission the converts to the religion of Jesus Christ were admitted through baptism to fellowship in thousands at a time, without any preliminary inquiry into their dispositions, and without any instruction in the articles of Christian belief or the new obligations contracted by admission into the Christian body. But when the first enthusiasm of conversion had cooled doubtless many were found who "walked no more" in the way of the apostles and went back to their pagan or their Jewish beliefs and practices, or worse, who after two changes of religion lapsed into open contempt of all religion and of all morality. To guard against the scandal of such apostasies the Church provided a system of preliminary graduated instruction and probation for those who desired admission to the Christian communion. The candidates for admission to the Church, to the body of the faithful (believers, *fideles, pistoi*) were called catechumeni (persons under instruction) and even in this class there were three or even four separate grades. There was the first grade, that of those who, having expressed a desire for admission were put under instruction privately by some officer of the Church: this class was not admitted at all to the assemblies of the faithful. Those in the second grade, that of the *acroomenoi, audientes,* hearers, were admitted to the assembly for worship, but were required to withdraw after the reading of the stated passages from the evangelic and apostolic books and the sermon or exhortation by the bishop. Those of the third grade, the *gonyclinontes, genuflectenter,* those "bending the knee," that is, who join in the prayers of the faithful, remained in the congregation till certain prayers in the liturgy were said and the bishop had pronounced his benediction. The fourth grade included all those who, having passed the first three were to receive the rite of baptism and thereby were to be admitted to full communion with the faithful on the next stated day for administration of that sacrament: these are the *photizomenoi,* instructed, or *competentes,* or *electi.* The first two grades are not recognized as two by all Church historians.

Such a term of preliminary instruction and probation was imperatively necessary in the ages of persecution, to save the Christian body from the scandal of apostasy on the part of converts who entered the Church either from unworthy motives, as, for example to act as informers; or who entered without weighing the obligation they assumed to lead a holy life void of all offense, and who disgraced their Christian profession by their disorderly lives. The institution of the catechumenate persisted after the peace of the Church was proclaimed by the first Christian emperor, and indeed the need of it was greater now that the profession of the Christian religion seemed the gateway to honor and power in the state instead of to martyrdom. The press of candidates for admission to the Church was great; and even the children of believers like converts from the pagan religion had to pass through the catechumenal grades. Out of this grew a great abuse and a great scandal. Men who sought admission to the Church for other reasons than a desire to lead a Christian life, would enter themselves as catechumens, postulants, and would continue in that grade for an indefinite period, not pledging themselves to observance of the law of Christ and the Church till the end of their life was at hand. Nor was it the converts from paganism alone that thus deferred baptism, as Constantine did, but the children of Christian parents often followed their example. Yet the motive for deferring baptism was not always a desire to evade the obligations of the Christian profession; in very many instances the delay was prompted by a conscientious scruple lest the baptized person falling from grace afterward should commit a sin that could never be condoned: among illustrious men who for a time acted on this scruple are numbered even doctors of the Church — Saints Ambrose, Gregory of Nazianzum, Augustin.

The ancient church edifices provided for the separation of the catechumens from the faithful that were in full communion. In the ancient church of Saint Clement in Rome, the body of the building is divided off by stone constructions into the *presbyterium,* chancel or sanctuary for the clergy at the eastern end, a middle compartment for the faithful in full communion — the galleries here being reserved for the women — and in the western end, or front, a much larger compartment of the nave for the catechumens.

Category, in logic and philosophy, an assemblage of all the beings contained under any genus or kind ranged in order. Metaphysicians distribute all beings, all the objects of our thoughts or ideas, into certain genera or classes, which classes the Greeks call categories, and the Latins predicaments. The ancients, follow-

ing Aristotle, generally make 10 categories. Under the first all substances are comprised, and all accidents or attributes under the last nine, namely, quantity, quality, relation, action, passion, time, place, situation, and habit. This arrangement, however, is now almost excluded. Descartes thought that all nature may be better considered under these seven divisions: spirit, matter, quantity, substance, figure, motion, and rest. Others make but two categories, substance and attribute, or subject and accident; or three, accident being divided into the inherent and circumstantial. The arrangement of the 10 categories was borrowed from the Pythagorean school. It is said to have been invented by Archytas of Tarentum. From him it passed to Plato (who, however, admitted only five categories — substance, identity, diversity, motion, and rest) and from Plato to Aristotle. The Stoics held four — subjects, qualities, independent circumstances, relative circumstances. The term categories is applied by J. S. Mill to the most general heads under which everything that may be asserted of any subject may be arranged. Of these, five are recognized by Mill; namely, existence, coexistence, sequence or succession, causation, and resemblance. This arrangement affords a general classification of all possible propositions, which must thus either affirm or deny the existence of one or more things or attributes, the coexistence, sequence, or resemblance of two or more things or attributes, or must affirm or deny that one thing is the cause of another. Causation, however, is regarded by him only as a peculiar case of succession, so that the five categories of Mill may be considered to be reduced to four, causation being omitted. For the categories of Kant, see KANT.

Catel, kä tĕl, Franz, German artist: b. Berlin 22 Feb. 1778; d. Rome 19 Dec. 1856. His earliest efforts were designs for illustrated almanacs. He then painted in oil and water colors, and took up his abode in Rome in 1812. Overbeck, Schadow, and Cornelius gave him much encouragement, and he painted historical and genre pieces, and landscapes, in which last-named department of his art he was especially successful. During a residence in Sicily, about the year 1818, he painted a large number of views of Mount Ætna, and other prominent places on the island. He died rich, directing his fortune to be invested for the benefit of poor artists.

Cat'enary, the curve assumed by a perfectly flexible cord supported at both ends and allowed to sag between supports. The cables of a suspension bridge hang in catenaries before any of the other parts of the bridge are attached. The effect of the weight of the road-way, etc., is to draw the cables into curves more nearly approaching the parabola.

Cat'erpillar, the larva of a moth or butterfly. The body is long and cylindrical, consisting, besides the head, of 3 thoracic and 10 abdominal segments, the last one forming the suranal plate. The three pairs of thoracic legs are solid, horny, and jointed, while the supports of the abdominal segments, of which there are five pairs, are soft and fleshy. Caterpillars are very voracious, the digestive canal being very large. The American silk-worm (*Telea polyphemus*), at the end of its life as a caterpillar, has eaten not less than 120 oak leaves weighing three fourths of a pound; its food, taken in 56 days, equals in weight 86,000 times the primitive weight of the worm. The jaws of caterpillars are large, black, horny appendages, and are toothed on the cutting edge so as to pass through a leaf somewhat like a circular saw. The eyes are minute, simple eyelets, three or four on each side of the head, and only useful, probably, in distinguishing day from night. The silk is spun through the tongue-like projection (spinneret) of the under lip. It is secreted in two long sacs within the body. The thread is drawn out by the two fore feet, which are three-jointed and end in a single claw. The legs on the hind body, sometimes called prop-legs, are fleshy, not jointed, and end in a crown of hooks which curve outward, enabling the caterpillar to firmly grasp the edge of the leaf or a twig of its food-plant. Most caterpillars are more or less hairy or spiny, rendering them, when especially so, disagreeable to birds; besides this, they are bright colored, so that birds readily recognize them and waste no time over them, but search for the common green smooth-bodied ones, which are, however, so difficult of detection by the birds that plenty are left to become moths or butterflies. Certain caterpillars, as the currant-worm, though smooth-bodied, are brightly spotted; these, however, have a disagreeable taste. The bright colors are thus danger signals, hung out to warn the birds and other enemies.

Catesby, Mark, English naturalist: b. probably in London about 1679; d. London 23 Dec. 1749. He traveled in North America in 1710–19 and 1722–6, and published 'Natural History of Carolina, Florida, and the Bahama Islands' (2 vols. 1731–43), 'British-American Flowers,' and a work on the fishes, reptiles, and insects of the isle of Providence. German translations of the first and last appeared at Nuremberg.

Catfish, any of the fishes of the order *Nematognathi,* more especially of the family *Siluridæ.* This large family is characterized by having the body naked or covered with bony plates, but without true scales. About the mouth there are two or more barbels, the longest of which are at the corners of the mouth. There is usually a stout, generally serrated, spine in front of the dorsal fin, and another in front of each pectoral fin. These spines are likely to inflict considerable injury on the careless fisherman. There is a poison-gland connected with the pectoral spine of some of the smaller species, and wounds are very painful. This is one of the most widely distributed families of fishes, and is especially abundant in South America and Africa. Most of them live in fresh waters. There are estimated to be about 1,000 species.

The catfish are sluggish in their movements, securing their prey rather by stratagem than by swiftness. They are bottom-feeders and indiscriminate, so that although, on account of their size and abundance, they constitute an important element in the fish food of the countries they inhabit, their flesh is not considered of high quality in taste. North and middle America contain 100 or more species, of which a third, perhaps, are to be found in the United States and Mexico. The majority are not of much importance, but some are of great local value. At the head of the commercial list stands the

channel cats of the genus *Ictalurus,* which are found throughout the Mississippi valley and gulf States, and are caught in vast quantities not only for home use, but for export, as much as 2,000,000 pounds annually being dressed, packed in ice, and shipped from Morgan City, La., the central mart of the Atchafalaya River fisheries, which are in operation from September to May. The method of capture is by "trot-lines" from a few yards to a mile long. The catfish move with the season's temperature of the water, going down stream in winter and up in summer. At the season of the spring floods they are carried over the swamps and adjacent lands, and thousands are caught by the shorter "brush" lines. There is a regular collecting service of tugs. The Louisiana species most taken is the chucklehead (*I. furcatus*), which loves sluggish waters. A more northerly species, ordinarily 20 to 25 pounds in weight, is the "blue" or "white" channel cat (*I. punctatus*), which thrives in the colder, swifter waters of the Tennessee, Cumberland, and neighboring rivers, whose flesh is declared equal to that of the black bass. Both these have been acclimated in California. The largest of the American species is the great fork-tailed Mississippi cat (*Amiurus lacustris*), which inhabits all the lakes and big rivers from the Saskatchewan and Great Lakes to Florida and Texas, and reaches a weight of 150 pounds or more. The so-called Potomac River cat (*A. catus*) is the one most familiar in the east, since it abounds from the Delaware River to Texas, but is most common in the waters of Chesapeake Bay and southward to Florida. It is next in commercial value to the Great Lakes fish. It has a very wide head and large mouth, but seldom exceeds two feet in length. The smaller yellow cat (*A. natalis*) and other species of this genus are numerous in the interior, but not of great importance. (See BULLHEAD.) The mud cat or goujon (*Leptope olivaris*) is a slender pike-like fish with a very large, wide head and mouth, and a thick skin, which lives in the sluggish rivers of the southern States. It is sometimes five feet long and 100 pounds in weight, but is most repulsive in appearance; its flesh, however, is excellent, and is often sold, dressed, for that of the favorite western channel cat. Other genera and species go by such names as mud-cats, stone-cats, mad toms, etc., and will be found elsewhere described, as well as many foreign species of interest and value.

Consult, besides general works, Jordan and Evermann, 'Food and Game Fishes of America,' and the publications of the United States Fish Commission.

Cat'gut is made from the intestines of different quadrupeds, particularly those of sheep. The manufacture is chiefly carried on in Italy and France. The texture from which it is made is that which anatomists call the muscular coat, which is carefully separated from the peritoneal and mucous membranes. After a tedious process of steeping, scouring, fermenting, inflating, etc., the material is twisted, rubbed with horse-hair cords, fumigated with burning sulphur to improve its color, and dried. Cords of different size, and strength, and delicacy, are obtained from different domestic animals. The intestine is sometimes cut into uniform strips with an instrument made for the purpose. To prevent offensive effluvia during the process, and to get rid of the oily matter, the French make use of an alkaline liquid called *eau de javelle.* Catgut for stringed instruments, as violins and harps, is made principally in Rome and Naples. For the smallest violin strings three thicknesses are used; for the largest seven; and for the largest base-viol strings 120. It is well known that the membranes of lean animals are tougher than those in a high-fed condition, and there can be no doubt that from the lean and small-sized Italian sheep strings superior to all others are produced. In Naples, whence the best treble strings, commonly called "Roman," are obtained, there are large manufactories of this article.

Cath'a, a genus of plants belonging to the order *Celastraceæ,* or staff-tree family. The species are mostly natives of Africa, forming small shrubs, sometimes with spiny branches. *Catha edulis* is a native of Arabia, and from the leaves the Arabs make a beverage possessing properties analogous to those of tea or coffee. Under the name of *kât* or *cafta,* the leaves form a considerable article of commerce among the natives. Chewed, they produce wakefulness and hilarity of spirits.

Cathari, the name given to themselves by the adherents of numerous heretical sects, undoubtedly of Gnostic and Manichean origin, which swarmed in western Europe, and particularly in northern Italy and southern France in the 12th century. At that period society had much advanced in wealth and power, which brought their concomitant vices. There were many abuses prevalent in the Church, and some of the clergy led scandalous lives. The numerous heretical sects won adherents by violently and indiscriminately denouncing the entire hierarchy, from the Pope down to the monastic orders; but their tirades were not more emphatic than the philippics launched against the same scandals by sincere Catholics, their contemporaries, such as St. Bernard, St. Hildegarde, St. Malachi, archbishop of Armagh, and others. But while these sought to procure the eradication of the current abuses by a reformation from within the Church, the Cathari (Gr. *katharos,* Lat. *mundus, purus,* and *puritanus,* pure, clean) aimed at nothing short of the total destruction of the dominant religion, of its whole system of belief and even of its moral teaching. For not only were the sects styled Cathari (including a host of offshoots of eastern manicheism), heretics and reformers, but in their inner circles, dualists, believers in the existence of two supreme principles, the one a good principle, God, and the other an evil principle, the creator of the material world. But open profession was not made of this tenet: it was communicated only to the inner circle in the several manichean sects, to the elect ones, the *perfecti,* but withheld from the mass of their followers, the *credentes,* the faithful vulgar. To these latter and to outsiders the adepts of the *arcana* of catharism made profession of being strictly reformers of a corrupt ecclesiastical system, and of profound regard for the letter and spirit of the moral law as taught in the apostolic writings. As already said, they enthroned the evil principle as creator of the physical universe; they believed in the divine mission of Jesus Christ, the Son of God, that is, of the good principle; but with the Docetæ they denied that the Son of God had assumed human nature really, and held that his

humanity was phantasmal only. In conformity with their tenet of a supreme principle of good and a supreme principle of evil, the initiates condemned as works of the flesh, the sacraments of the Church as a whole, and looked on the contract of marriage as sinful. They held absolute predestination: that all men belong to one or other of two classes, those who will infallibly be saved, and those who cannot possibly attain holiness: hence their doctrine that an infant dying immediately after birth, if it belongs to the class of those predestined to be lost, is punished as is Judas in hell. They dared not confess that on their principles the elect cannot lose the divine favor by sin; but they did teach that repentance is of no account, and that the sins of the people are forgiven by the rite (*consolamentum*) of laying on hands. This honor was only a concession to the prejudices of the ignorant vulgar: the *perfecti*, the initiates of the *arcana* of catharism held themselves to be superior to the moral law.

Cath'arine, the name of several Christian saints: 1. St. Catharine of Alexandria, a virgin of royal descent in Alexandria, who publicly confessed the Gospel at a sacrificial feast appointed by the Emperor Maximinus, and was therefore put to death, after they had vainly attempted to torture her on toothed wheels, 307 A.D. Hence the name of Catharine wheel (q.v.). No less than 50 heathen philosophers sent by the emperor to convert her in prison were themselves converted by her winning eloquence; whence she is the patroness of philosophers and learned schools. Having steadily rejected all offers of earthly marriage, she was taken in vision to heaven, where Christ plighted his troth to her with a ring. This subject has been a favorite one with many artists (as signifying the union of the redeemed soul with Christ); the Christ being usually represented as an infant. It has been suggested that the attributes of the unhistorical St. Catharine seem to have been derived from those of the actual Hypatia, a heathen who suffered death at the hands of Christian fanatics. St. Catharine's festival falls on 25 November. 2. St. Catharine of Sienna, one of the most famous saints of Italy, was the daughter of a dyer in Sienna, and was born there in 1347. While yet a child she practised extraordinary mortifications and devoted herself to perpetual virginity. She became a Dominican, and therefore afterward a patron saint of the Dominicans. Her enthusiasm converted the most hardened sinners, and she was able to prevail upon Pope Gregory XI. for the sake of the Church to return from Avignon to Rome. She was given, it was said, extraordinary tokens of favor by Christ, whose stigmata were imprinted upon her body. She wrote devotional pieces, letters, and poems, an edition of which is Tomasseo's (Florence 1860). Her festival falls on April 30. 3. St. Catharine of Bologna (1413–63), festival March 9, and St. Catharine of Sweden (d. 1381; festival March 22), are of less note.

Catharine, St., Order of, the name of two organizations of very different character: (1) The Knights of St. Catharine on Mount Sinai, an ancient military order, instituted for the protection of the pilgrims who came to visit the tomb of St. Catharine on this mountain. (2) An organization in Russia, constituting a distinction for ladies, and instituted by Catharine, wife of Peter the Great, in memory of his signal escape from the Turks in 1711.

Catharine I., Empress of Russia: b. Ringen, near Dorpat, Livonia, 15 April 1684; d. St. Petersburg 17 May 1727. The early history of this remarkable woman is uncertain. According to some accounts she was the daughter of a Swedish officer named Rabe, who died shortly after she was born; according to others her father was a Roman Catholic peasant. She at first bore the name of Martha and entered the service of a clergyman named Glück, at Marienburg, who caused her to be instructed in the Lutheran religion. Here she was married to a Swedish dragoon. But a few days after he was obliged to repair to the field, and the Russians, within a short period, took Marienburg in 1702. Martha fell into the hands of Gen. Tcheremetieff, who relinquished her to Prince Menzikoff. While in his possession she was seen by Peter the Great, who made her his mistress. She became a proselyte to the Greek Church, and assumed the name of Catharine Alexiewna. In 1708 and 1709 she bore the emperor the Princesses Anna and Elizabeth, the first of whom became the Duchess of Holstein by marriage, and mother of Peter III. The second became empress of Russia. In 1712 the emperor publicly acknowledged Catharine as his wife. She was subsequently proclaimed empress, and crowned in Moscow in 1724. Beside the daughters above named she bore the emperor five more children, all of whom died early. The Princesses Anna and Elizabeth were declared legitimate. When Peter, with his army, seemed irreparably lost on the Pruth in 1711 Catharine endeavored to win over the grand vizier; and having succeeded, by bribing his confidant with her jewels, she disclosed her plan to the emperor, who gave it his approbation, and was soon relieved. She afterward received many proofs of the gratitude of her husband. Peter even deemed her worthy of being his successor. But in the latter part of 1724 she fell under his displeasure. Her chamberlain, Moens, with whom she was suspected of being on too intimate terms, was beheaded on pretense that he had been bribed by the enemies of Russia. Menzikoff, who had always manifested much attachment to her, had now been in disgrace for some time, and Peter had very frequent attacks of bodily pain, with intervals only marked by dreadful explosions of rage. These circumstances made Catharine's situation critical, and her anticipations of the future must have been the more melancholy, as the emperor had uttered some threats of a change in the succession to her disadvantage. To prevent such an event she applied to Menzikoff; and by the prudence of Jaguschinski, a reconciliation was effected with the emperor. The empress and the favorite were laboring to confirm their improving prospects when Peter the Great died, 28 Jan. 1725. Catharine, Menzikoff, and Jaguschinski considered it necessary to keep the death of the emperor a secret until, by judicious arrangements, they had secured the succession of the throne to the empress. Theophanes, archbishop of Plescow, swore before the people and troops that Peter on his death-bed had declared Catharine alone worthy to succeed him in the government. She was then

proclaimed empress and autocrat of all the Russias, and the oath of allegiance to her was taken anew. At first the cabinet pursued the plans of Peter, and, under Menzikoff's management, the administration was conducted with considerable ability. But the pernicious influence of favorites was soon felt, and great errors crept into the administration. Catharine died suddenly, her death being probably hastened by excess in the use of ardent spirits.

Catharine II., Empress of Russia: b. Stettin 2 May 1729; d. St. Petersburg 17 Nov. 1796. She was a daughter of the Prince of Anhalt Zerbst and her name was originally Sophia Augusta. The Empress Elizabeth chose her for the wife of Peter, her nephew, whom she appointed her successor. The young princess accompanied her mother to Russia, where she joined the Greek Church, and adopted the name of Catharine Alexiewna, given to her by the empress. The marriage was celebrated 1 Sept. 1745. It was not a happy one, but Catharine found relief in the improvement of her mind. She was endowed with uncommon strength of character; but the ardor of her temperament and the ill treatment of her husband led her into errors which had the most injurious influence on her whole political life. In January 1762, the Empress Elizabeth died, and Peter III. ascended the throne. He lived in the greatest dissipation, and on such intimate terms with a lady of the court, named Elizabeth Woronzoff, that it was generally thought that he would repudiate Catharine and marry his mistress. The empress, therefore, was obliged to take measures for her personal security. At the same time Peter grew continually more and more unpopular with his subjects, which led to a conspiracy, at the head of which were the hetman, Count Rasumowski, Count Panin, the enterprising Princess Daschkoff, and a young officer of the guards, Gregory Orloff. All those who were dissatisfied, or who expected to gain by a change, joined this conspiracy. Panin and the greater part of the conspirators were actuated only by the desire to place the youthful Paul on the throne, under the guardianship of the empress and a council of the empire. But this plan was changed through the influence of the Orloffs. The guards were the first to swear allegiance to the empress on her presenting herself to them at Peterhoff on the morning of 9 July 1762; and Alexei Orloff prevailed on Teplow, afterward appointed senator, to read at the Kazan Church, instead of the proclamation of the conspirators in favor of the young prince, one announcing the elevation of Catharine to the throne. Peter died a few days after in prison. The accusation against Catharine of having contributed to hasten this event is without foundation. The young, ambitious princess, neglected by her husband, whom she did not respect, remained passive on the occasion, yielded to circumstances, which were, it is true, propitious to her, and consoled herself for an event which she could not remedy. She knew how to gain the affections of the people by flattering their vanity; showed great respect for their religion; caused herself to be crowned at Moscow with great pomp; devoted herself to the promotion of agriculture and commerce, and the creation of a naval force; improved the laws; and showed the greatest activity in the administration of the internal as well as the external affairs of Russia. A year after her ascension to the throne she forced the Courlanders to displace their new Duke, Charles of Saxony, and to recall Biren, who was extremely odious to the nobles. After the death of Augustus III., king of Poland, she was the means of Stanislaus Poniatowski's being crowned at Warsaw. But while she was forcing this king on the Poles, the number of the malcontents in her own empire increased, and several attempts against her life were made at St. Petersburg and Moscow. The young Ivan was the person to whom the hopes of the conspirators were directed; but his sudden death at the fortress of Schlüsselburg overthrew the plans of the disaffected. After this the court of the empress was only disturbed from time to time by intrigues, in which gallantry and politics went hand in hand, and which had no other object than to replace one favorite by another. In the midst of pleasure and dissipation Catharine did not neglect the improvement of the laws. Deputies from all the provinces met at Moscow. The empress had herself prepared instructions for their conduct, which were read at the first session; but it was impossible for so many different nations to understand each other, or to be subject to the same laws. Catharine, who presided at the debates, and received from the assembly the title of mother of the country, soon dismissed the discordant legislators. About this time France formed a party in Poland against Russia; but these attempts only served to accelerate Catharine's plans. The war to which the Porte was instigated had the same result. The Turks were beaten. The Russian flag was victorious on the Greek seas; and on the banks of the Neva the plan was formed of re-establishing the republics of Sparta and Athens as a check to the Ottoman power. The advancement of Austrian troops into Poland inspired Catharine with the desire to aggrandize herself in this quarter. She therefore entered into an agreement for the division of the country with the courts of Berlin and Vienna in 1772, by which the governments of Polotzk and Mohilev fell to her share, and she insured to herself exclusive influence in Poland by undertaking to guarantee the Polish constitution. At the same time she abandoned all her conquests, with the exception of Azoph, Taganrog, and Kinburn, in the peace with the Porte, concluded at Kainardschi in 1774, but secured to herself the free navigation of the Black Sea, and stipulated for the independence of the Crimea. By this apparent independence the Crimea, became, in fact, dependent on Catharine. This peace was as opportune as it was advantageous to Russia; for in the third year of the war Moscow and several other cities were desolated by the plague; and about the same time an adventurer named Pugatscheff, assuming the name of Peter III., had excited a revolt in several provinces of eastern Russia, which was soon suppressed. At this time Potemkin exercised an unlimited influence over the empress. In 1784 he succeeded in conquering the Crimea, to which he gave its ancient name of Tauris, and extended the confines of Russia to the Caucasus. Catharine upon this traversed the provinces which had revolted under Pugatscheff, and navigated the Volga and Dnieper, taking greater interest in the expedition, as it

was attended with some danger. She was desirous, likewise, of seeing Tauris. Potemkin turned this journey, which took place in 1787, into a triumphal march. Throughout a distance of nearly 1,000 leagues nothing but feasts and spectacles of various kinds were to be seen. Palaces were raised on barren heaths, to be inhabited for a day. Villages and towns were built in the wildernesses, where a short time before the Tartars had fed their herds. An immense population appeared at every step — the picture of affluence and prosperity. A hundred different nations paid homage to their sovereign. Catharine saw, at a distance, towns and villages, of which only the outward walls existed. She was surrounded by a multitude of people, who were conveyed on during the night, to afford her the same spectacle the following day. Two sovereigns visited her on her journey — the king of Poland, Stanislaus Augustus, and the Emperor Joseph II. The latter renewed his promise, given at St. Petersburg, to assist her in her projects against the Turks. The result was a new Turkish war, which by the Peace of Jassy (1792), ended not less favorably for Russia than the first. The power of Russia was also increased by the war with Sweden which terminated in 1790, and by the last two partitions of Poland and the incorporation of Courland. Catharine took no part in the war against France, though she broke off all connection with the French republic, actively assisted the emigrants, and entered into an alliance with England against France. She likewise made war against Persia, and, as some historians assure us, entertained the project of destroying the power of the English in Bengal, when a fit of apoplexy put an end to her life.

Catharine II. has been equally censured and praised. With all the weakness of her sex, and with a love of pleasure carried to licentiousness, she combined the firmness and talent of a powerful sovereign. Two passions were predominant with her until her death, love and ambition. She was never without her favorite, yet she never lost sight of her dignity. She was distinguished for activity, working with her ministers, writing letters to Voltaire and Diderot, and signing an order to attack the Turks, or to occupy Poland, in the same breath. She favored distinguished authors, and was particularly partial to the French. At Paris she had a literary agent (Baron Grimm). She several times invited Voltaire to her court, proposed to D'Alembert to finish the 'Encyclopædia' at St. Petersburg, and to undertake the education of the grand-duke. Diderot visited her at her request, and she often allowed him the privilege of familiar conversation with her. By these means she gained the favor of the literati of Europe, who called her the greatest of rulers; and, in fact, she was not without claims to this title. She protected commerce, improved the laws, dug canals, founded towns, hospitals, and colleges. Pallas and others traveled at her expense. She endeavored to put a stop to the abuses which had crept into the administration of the different departments of government; but she began without being able to finish. Civilization advanced but slowly in Russia under her reign; and her anxiety to enlighten her subjects ceased when she began to entertain the idea that the French Revolution had been brought about by the progress of civilization. Laws, colonies, schools, manufactures, hospitals, canals, towns, fortifications, everything was commenced, but frequently left unfinished for want of means. See Tooke, 'History of Catharine II.' (1803); Castara, 'Vie de Catherine II.' (1796); Tannenberg, 'Leben Catherinens II.' (1797); Herzen, 'Mémoires de l'Impératice Catharine II.' (1859).

Catharine Howard, Queen of England. See HOWARD, CATHARINE.

Catharine Parr. See PARR, CATHARINE.

Catharine Paulowna, pow-löf'na, Queen of Würtemberg: b. 21 May 1788; d. 9 Jan. 1819. She was a daughter of Paul I. of Russia, and in 1809 married George, Duke of Holstein Oldenburg. After his death in 1812, she accompanied her brother, Alexander, on his campaigns in Germany and France (1813–14), to Paris, London, and the congress of Vienna (1815), assisting him by her talents and resolute spirit. The marriage of her younger sister to the Prince of Orange is said to have been effected by her influence. In 1816 she married William, Crown Prince of Würtemberg, whose acquaintance she had made during her travels. During the famine of 1816 in that country she proved her benevolence by the formation of female associations and an agricultural society. She was active in promoting the education of the people.

Catharine of Ar'agon, Queen of England, the youngest daughter of Ferdinand of Aragon and Isabella of Castile: b. Alcalá de Henares, Spain, 15 Dec. 1485; d. Kimbolton, Huntingdonshire, 7 Jan. 1536. In 1501 she was married to Arthur, Prince of Wales, son of Henry VII. Her husband dying about five months after, the king, unwilling to return her dowry, caused her to be contracted to his remaining son, Henry, and a dispensation was procured from the Pope for that purpose. In his 15th year the Prince made a public protest against the marriage; but at length yielding to the representations of his council, he consented to ratify the contract, and on his accession to the throne in 1509 was crowned with her. The inequality of their ages and the capricious disposition of Henry were circumstances very adverse to the durability of their union, and it seems surprising that Catharine should have acquired and retained an ascendancy over the affections of the king for nearly 20 years. The want of male issue, however, proved a source of disquietude to him, and scruples, real or pretended, at length arose in his mind concerning the legality of their union, which were greatly enforced by a growing passion for Anne Boleyn, one of the queen's maids of honor. He made application to Rome for a divorce from Catharine. But all that Henry could obtain at Rome was a promise to investigate the case. Catharine, meanwhile, conducted herself with gentleness and firmness, and could not in any way be induced to consent to an act which would render her daughter illegitimate, and stain her with the imputation of incest. Being cited before the papal legates, Cardinals Wolsey and Campeggio, in 1529, she declared that she would not submit her cause to their

judgment, but appealed to the court of Rome; which declaration was declared contumacious. His failure to secure the sanction of the Pope to the divorce induced the king to decide the affair for himself; and the condemnation of his conduct expressed on this occasion by the court of Rome provoked him to throw off his submission to it, and declare himself head of the English Church — an act of royal caprice more important than most in history. In 1532 he married Anne Boleyn; upon which Catharine, no longer considered queen of England, retired to Ampthill in Bedfordshire. Cranmer, now raised to the primacy, pronounced the sentence of divorce, notwithstanding which Catharine still persisted in maintaining her claims. Shortly before her death she wrote a letter to the king, recommending their daughter (afterward Queen Mary) to his protection, praying for the salvation of his soul, and assuring him of her forgiveness and unabated affection. The pathos of this epistle is said to have drawn tears from Henry. He had never presumed to call the virtues of his injured wife in question, and she certainly acted throughout with eminent dignity and consistency. Several devotional treatises have been attributed to Catharine which belong to Queen Catharine Parr.

Catharine of Braganza, brä-gän'zä, wife of Charles II., king of England, and daughter of John IV., king of Portugal: b. Villa Viçosa, Portugal, 25 Nov. 1638; d. Portugal 31 Dec. 1705. In 1662 she married Charles II., in whose court she long endured all the neglect and mortification to which his dissolute conduct necessarily exposed her, and which became still more galling from her having no children; still she conducted herself with great equanimity, and after the death of Charles, received much attention and respect. In 1693 she returned to Portugal, where, in 1704, she was made regent by her brother, Don Pedro, whose increasing infirmities rendered retirement necessary. In this situation Catharine showed considerable abilities, carrying on the war against Spain with great firmness and success.

Catharine of France. See CATHARINE OF VALOIS.

Catharine de Medici, dā mā'dā-chē, Queen of France: b. Florence 1519; d. Blois, France, 5 Jan. 1589. She was the only daughter of Lorenzo de Medici, Duke of Urbino, and the niece of Pope Clement VII. Francis I. consented that his son, Henry, should marry her only because he did not believe she ever would ascend the throne, and because he was in great want of money, with which Lorenzo could furnish him. The marriage was celebrated at Marseilles in 1533. Catharine was equally gifted with beauty and talents, and had cultivated her taste for the fine arts in Florence; but at the same time imbibed the perverted principles of politics then prevailing in Italy. Catharine's ambition was unbounded. She sacrificed France and her children to the passion for ruling; but she never aimed steadily at one great end, and had no profound views of policy. The situation in which she was placed, on her arrival at the French court, gave her great opportunity to perfect herself in the art of dissimulation. She flattered alike the Duchess d'Etampes, the mistress of the king, and Diana de Poitiers, the mistress of her own husband, though these two ladies hated each other. From her apparent indifference she might have been supposed inclined to shun the tumult of public affairs; but when the death of Henry II. in 1559 made her mistress of herself, she plunged her children in a whirl of pleasures, partly to enervate them by dissipation, partly from a natural inclination toward prodigality; and in the midst of these extravagances cruel and bloody measures were executed, the memory of which still makes men shudder. Her authority was limited under the reign of Francis II., her eldest son, who, in consequence of his marriage with the unfortunate Mary Stuart, was entirely devoted to the party of the Guises. Jealous of a power she did not exercise, Catharine then decided to favor the Protestants. If it had not been for her patronage, by which the ambition of the chiefs of the Huguenots was stimulated, the conflicting religious opinions in France never would have caused such lasting civil wars. Catharine felt herself embarrassed by this indulgence toward the innovators, when the death of Francis II. placed the reins of government, during the minority of Charles IX., in her hands. Wavering between the Guises on one side, who had put themselves at the head of the Roman Catholics, and Condé and Coligny on the other, who had become very powerful by the aid of the Protestants, she was constantly obliged to resort to intrigues, which failed to procure her as much power as she might easily have gained by openness of conduct. Despised by all parties, but consoled if she could deceive them; taking arms only to treat, and never treating without preparing the materials for a new civil war, she brought Charles IX., when he became of age, into a situation in which he must either make the royal authority subordinate to a powerful party, or cause part of his subjects to be massacred, in the hope, at best a doubtful one, of subduing faction. The massacre of St. Bartholomew was her work. She induced the king to practise a dissimulation foreign to his character; and as often as he evinced a disposition to free himself from a dependence of which he was ashamed, she knew how to prevent him, by the fear and jealousy which she excited in him by favoring his brother Henry. After the death of Charles IX. Catharine became again regent of the kingdom, till the return of Henry III., then king of Poland. She contributed to the many misfortunes of his reign by the measures which she had adopted previously to its commencement, and by the intrigues in which she was uninterruptedly engaged. At her death, France was in a state of complete dismemberment. The religious contests were in reality very indifferent to her. The consequences she was not able to conceive. She was ready to risk life for the gratification of her ambition. She was equally artful in uniting her adherents, and in promoting dissension among her adversaries. To those who directed her attention to the prodigal expenditure of the public treasure, she used to say, «One must live.» Her example contributed greatly to promote the corruption of morals which prevailed in her time. Her manners, however, were elegant, and she took a lively interest in the sciences and arts. She procured valuable manuscripts from Greece and Italy, and

caused the Tuileries and the Hotel de Soissons to be built. In the provinces, also, several castles were erected by her order, distinguished for the beauty of their architecture, in an age when the principles of the art were still unknown in France. She had two daughters, Elizabeth, married to Philip II. of Spain in 1559, and Margaret of Valois, married to Henry of Navarre, afterward Henry IV. See Alben, 'Vita di Caterina di Medici' (1834); La Ferrière, 'Lettres de Catherine de Medicis' (1880–5).

Catharine of Valois, văl'wä, Queen of England, youngest child of Charles VI. and Isabella of Bavaria: b. Paris 27 Oct. 1401; d. 3 Jan. 1438. In 1420 she was married to Henry V. of England, who was then declared successor to the crown of France. To this prince she bore Henry VI., crowned in his cradle king of both countries. After the death of Henry, in 1422, Catharine privately married Owen Theodore, or Tudor, a Welsh gentleman of small fortune, but descended from the ancient British princes. By this marriage she had two sons, the eldest of whom, Edmund, earl of Richmond, by a marriage with Margaret Beaufort, of the legitimated branch of Lancaster, became father of Henry VII. and founder of the house of Tudor.

Catharine-wheel, a window or compartment of a window of circular form, sometimes with radiating divisions or spokes, used in mediæval buildings, called a rose, or marigold window. It is a memorial of St. Catharine's martyrdom. The term is also applied to a kind of firework in the shape of a wheel, made to revolve automatically when lighted; a pinwheel.

Cathar'tic, any remedy that will cause an emptying of the intestinal canal. For purposes of general description there are four classes of cathartics. These are mild cathartics, or laxatives; simple purges, drastic purges, and hydragogues. Catharsis is accomplished either by increasing the amount of water in the intestines or by stimulating the movements of the intestines — peristalsis. The laxatives are water, sugar, honey, fruits, stringy vegetables, coarse bread, cassia fistula, sulphur, figs, etc.; these act either by giving bulk, stimulation of peristalsis, or by adding water, all of the sugars attracting water from the intestinal wall. The simple purges act usually by stimulating peristalsis. These are castor oil, cascara sagrada, rhubarb, aloes, senna, iris, podophyllum, leptandra, calomel, etc. The drastic purges stimulate peristalsis, and many of them cause a flow of water into the intestine. The simple purges in large doses are drastic. Gamboge, jalap, colocynth, scammony, croton oil, and elaterium are drastics. Another class of cathartics are salty, and by osmosis attract water into the intestines; they thus act as hydragogues and are termed the saline cathartics. Those most commonly used are epsom salts, rochelle salts, magnesium oxide, citrate, sodium phosphate, tartrate, and bitartrate. Most of the mineral waters belong to this class of cathartic. In former times cholagogues were described as cathartics that "stirred up the liver scretions." It is now fairly well recognized that those drugs that stimulate peristalsis affect the gall bladder, causing it to empty itself more actively, and that the liver is unaffected. The only true hepatic stimulant that is now recognized is ox-gall. This is frequently employed as a cathartic. Abuse of cathartics is an evil above all description. It is almost safe to assert that the injudicious use of the many patent cathartic pills on the market is responsible for more intestinal trouble than any other agent. They teach people to be careless of their intestinal functions and work incalculable injury. See CONSTIPATION.

Cathartidæ, the American vultures, a family of birds of the order *accipitres* or *Raptores,* differing from the more eagle-like Old World vultures (*Vulturidæ*) in having the beak comparatively slender, straight, and blunt, the complete absence of a septum between the nostrils, the much more largely naked head and neck, and the weak feet with elevated hallux and little curved claws. Altogether they are less predaceous birds, which feed exclusively on carrion or attack weakling animals. Five genera, each with but one or a few species, are found in America, more especially in the warmer parts. Among them are the carrion crow, the condor, and the turkey buzzard (qq.v.).

Cathay, kăth-ā', a name of which Marco Polo designated a part of Asia, probably north China.

Cath'cart, SIR George, son of William Shaw Cathcart (q.v.): b. London 12 May 1794; d. Inkerman, Crimea, 5 Nov. 1854. He entered the Life Guards in 1810, accompanied his father as attaché to Russia, and subsequently acted as aide-de-camp to the Duke of Wellington at Waterloo. He served in Nova Scotia and the West Indies, quelled the rebellion in Canada in 1837, and was appointed in 1852 governor at the Cape of Good Hope, where he showed ability in subduing the Kaffir insurrection. On the outbreak of the Crimean war great things were expected of him, but he fell as divisional commander at Inkerman.

Cathcart, William Shaw, EARL OF, English soldier and diplomatist: b. Petersham, England, 17 Sept. 1755; d. near Glasgow 17 June 1843. He studied at Glasgow, then entered the army, and served with distinction first in the American war and afterward in the campaigns against the French republic in Flanders and Germany. In 1801 he was made lieutenant-general, and in 1803 commander-in-chief for Ireland. In 1807 he was appointed commander of the land forces in the expedition against Copenhagen, and was created a viscount for his services on this occasion. In 1812 he proceeded to Russia as minister-plenipotentiary, joined the Emperor Alexander at the headquarters of the Russian army, and accompanied him through the campaigns of 1813–14. He entered Paris with the allied sovereigns, and was present at the Congress of Vienna. The same year he was created an earl. Subsequent to this he resided for several years at St. Petersburg as ambassador to the Russian court.

Cathe'dral (Lat. *cathedra,* a "seat." Thus, "to speak ex cathedra," is to speak as from a seat of authority). A cathedral city is the seat of the bishop of the diocese, and his throne is placed in the cathedral church. From the early times of the Christian Church the bishop presided in the presbytery or the assembly of priests. He was seated on a chair, a little higher than that of the others. The whole meeting of priests was called *cathedra;* and at a later period,

when Christians were allowed to build churches, this name was applied to the episcopal churches, and the name *basilica* to the particular churches erected in honor of a saint or a martyr. The distinction between cathedral and collegiate churches consists principally in the see of the bishop being at the former. The governing body of a cathedral is called the dean and chapter. The cathedral is commonly, though not invariably, the most important church building, architecturally speaking, in the diocese. Its usual form is a Latin or Greek cross, and from the comparatively simple outline of the early Christian basilica has been evolved in time the complex cathedral structure of the Middle Ages. In its outline a typical cathedral exhibits nave with north and south aisles, transepts with eastern and western aisles, choir with aisles north and south, retro-choir, and eastern Lady Chapel, a lantern tower at the crossing and two towers flanking the west end of the nave. French cathedrals are distinguished by their great height, chevets, or apsidal east ends with a corona of chapels, elaborate and logical vaulting system, and, in the later Gothic styles, by extremely profuse adornment. The portals of French churches generally are lofty and imposing and richly sculptured. English cathedrals are much longer and lower than French ones, their east ends are usually square and their portals small, and, as at Wells, even insignificant.

The Church of St. John of Lateran, at Rome, founded by Constantine, is the Episcopal church or cathedral of the Pope, and bears over its chief portal the inscription, *Omnium urbis et orbis ecclesiarum mater et caput*, "mother and head of all the churches of Rome and the world." At its chief altar none but the Pope can read mass, for it covers another ancient altar at which the apostle Peter is said to have officiated. The basilica of St. Peter's at Rome may be mentioned as surpassed by no cathedral in antiquity and splendor, and equaled by none in magnitude. The length of the interior is 613½ feet, width at transept 446½ feet, height of nave 153 feet. The cathedral at Cologne was begun in the middle of the 13th century, and only partly finished in 1509, after which work was not resumed on it till 1830. In 1863 the interior was thrown open to the public. In 1880 it was finished. The structure is 511 feet long and 231 feet wide. The towers are 501 feet high. The cathedral of Dantzig was commenced in 1343 and finished in 1503. Its length is 358 feet and its height 230 feet. Notre Dame, Antwerp, was begun toward the close of the 14th century; its length is 390 feet and its width 250 feet. The cathedral at Rheims was begun in 1211 and finished in 1430. It is 466 feet long. The cathedral at Amiens dates from 1220, and is 469 feet long, with a central spire 422 feet high. The cathedral at Strasburg was completed in 1601, and is one of the grandest Gothic structures in Europe. Its spire is 466 feet high. Notre Dame, Paris, was begun about 1163. Its length is 390 feet, width of transept 144 feet, height of vaulting 105 feet, of western towers 224 feet, width of front 128 feet, and length of nave to transept 186 feet. Salisbury Cathedral, England, founded 1220, finished in 1258, is a fine specimen. Its plan is a double cross, in extreme length, 474 feet, width of greater transept, 230 feet. Canterbury Cathedral, founded shortly after the Conquest, is 545 feet long and the greater transept, 170 feet. It has three towers, the central one being 230 feet high. The crypts, which extend under the whole structure, are the finest in England. Ely Cathedral is 516 feet long and 190 feet wide. Lincoln Cathedral is 524 feet long outside and 482 inside. The central tower is 300 feet high. The cathedral at York is 524 feet long, 250 feet wide, and has a superb central tower. The nave is 264 feet long, 106 feet wide, and 93 feet high. St. Paul's, London (the present edifice, the first having been destroyed in the great fire of 1666), was begun in 1675, and finished in 1710. It is built in the form of a Latin cross, and is 514 feet in length. The transept is 286 feet long, and the west front 180 feet wide. The campanile towers at the west end are each 222 feet in height. The dome is 365 feet from the ground, 356 feet from the floor of the building, 145 feet in diameter, and 404 feet from the ground to the top of the cross. The Cathedral of St. Peter and St. Paul, Philadelphia, has a dome 210 feet high. At Baltimore the Roman Catholic Cathedral is 190 feet long, 177 feet wide, and 127 feet high to the top of the cross. St. Patrick's Cathedral, New York, is 332 feet long and 132 feet in general width, with an extreme width at the transept of 174 feet. It has two tall spires at the west end and is designed after the most elaborate examples of French Gothic. The Cathedral of Notre Dame, Montreal, Canada, is 255 feet long, 135 feet wide, and has two towers, each 220 feet high. The Cathedral of Mexico was begun in 1573, and was finished in 1667. It is 500 feet long and 420 feet wide. The cathedral of Lima is 320 feet long and 180 feet wide. The cathedral of St. John the Divine (Protestant Episcopal) in New York, will, when completed, be the most ambitious structure of the kind on this continent. The cathedrals of Glasgow and Kirkwall are the only complete and entire cathedrals in Scotland, exclusive of modern edifices so called. See Addis, 'Cathedrals of Scotland'; Bell, 'Cathedral Series'; Bell, 'Handbooks to Continental Churches'; Bond, 'English Cathedrals'; Gilchrist and Perkins, 'Itinerary of English Cathedrals'; Van Rensselaer, 'English Cathedrals'; Wilson, 'Cathedrals of France.'

Cathe'dral, The, a poem by James Russell Lowell. The particular cathedral which suggested the thought of the poem is that of Chartres.

Cathedral Peak, a peak of the Sierra Nevada range, situated in Mariposa County, Cal. It is of granite formation and contains the source of the Merced River. It is 11,000 feet high.

Cathelineau, Jacques, zhăk kā-tē-lē-nō, French Vendean general: b. Pin-en-Mauge, Anjou, 5 Jan. 1759; d. 11 July 1793. On the breaking out of the French Revolution he was living quietly with his family, when an unforeseen event suddenly called him forth from obscurity. In March 1793, during the levy of the conscription which the national assembly had decreed, the youth of the district of St. Florent rose in insurrection, and put the officials and *gens d'armes* to flight. They then returned home, and were awaiting the terrible revenge of the Republicans, when news of the outbreak reached

Cathelineau. He instantly determined to put himself at the head of his countrymen. Causing the alarm-bell to be rung in different places, he was soon followed by almost all the men capable of bearing arms, surprised several republican posts, carried off their cannon, and now mustered several thousand strong. As he did not deem himself equal to the post of commander, he placed himself under Bonchamp and Elbée, but after the victory of Saumur, 9 June 1793, was formally invested as commander-in-chief. On this he resolved to make a decisive attack on Nantes, and appeared before it with 80,000 men, still further increased by 30,000, whom Charette brought from lower Poitou Notwithstanding these vast numbers, and the greatest display of undisciplined gallantry, the attack was repulsed, and Cathelineau died shortly after of the severe wounds which he had received.

Cath'erine. See CATHARINE.

Catherine Harbor, Russia, a port in the northwestern part of the empire on the Murman coast of the Kola peninsula. It was formally opened in 1900, the city having been built by imperial command. It is primarily a naval station, the harbor being a mile and a half long, 1,600 feet wide, and 70 to 160 feet deep. The port is ice free.

Cath'erine's, St., or **Santa Catharina,** an island close to the coast of Brazil, between lat. 27° and 28° S., and belonging to the province or state of Santa Catharina. It is 37 miles long and 10 broad, and contains Desterro, the state capital.

Cath'erwood, Mary Hartwell, American novelist: b. Luray, Ohio, 16 Dec. 1847; d. Chicago, Ill., 26 Dec. 1902. She was graduated from the Female College, Granville, Ohio, in 1868 and was married to John Steele Catherwood in 1887. Her especial field was the romance of American history and her writings include 'Old Caravan Days'; 'Craque-o'-Doom' (1881); 'The Romance of Dollard' (1889); 'The Story of Tonty' (1890); 'A Woman in Armor'; 'The Lady of Fort St. John' (1891); 'The Chase of St. Castin, and Other Tales' (1894); 'The Spirit of an Illinois Town' (1897); 'The White Islander'; 'Old Kaskaskia' (1893); 'The Days of Jeanne d'Arc'; 'Bony and Ban'; 'Mackinac and Lake Stories'; 'Spanish Peggy'; 'Lazare' (1902).

Cath'eter, any tubular organ used to insert into a mucous canal or hollow organ. Thus, there are nasal catheters for the nose, eustachian catheters for the internal ear, urinary catheters for the bladder. This latter is the more frequently used. Great care should be exercised in its use, that it be kept clean, to avoid cystitis (q.v.).

Cathetom'eter, in physics, an instrument for the exact measurement of small vertical distances. In its usual form it consists of a horizontal telescope, mounted so as to slide upon a fixed, graduated, upright support or post. The telescope is raised or lowered until its cross-hairs coincide with one of the objects whose difference in height is to be determined, and the position of the telescope upon the vertical, graduated post is noted by means of a vernier or micrometer. The telescope is then brought to the elevation of the second object in the same way, and the difference in the two readings gives the desired difference in height. A cathetometer that is well designed and constructed is an instrument capable of giving very precise results when in the hands of a skilful observer. It is greatly used in accurate barometry, for determining the height of the barometric column above the mercury in the cistern.

Cath'ode, that part of a galvanic battery by which the electric current leaves substances through which it has passed, or the surface at which the electric current passes out of the electrolyte; the negative pole.

Cathode Rays. See ETHER; MOLECULAR THEORY; RADIATION; etc.

Catholic Apostolic Church, a body of Christian believers which arose in Great Britain in 1835, consisting at first of the members of a congregation of a Scotch Presbyterian Church in London and their pastor, Edward Irving (q.v.), who separated themselves from that communion and effected a new church organization under the above name. They are also commonly designated as Irvingites. They regarded the gifts or *charismata,* which were divinely bestowed upon the first Christians — "the word of wisdom, gifts of healing, workings of miracles, prophecy, discernings of spirits, divers kinds of tongues, interpretation of tongues" — and the phenomena witnessed at the assembly of the faithful when the Spirit descended upon the 11 apostles, not as extraordinary and pertaining to the Church in that time only, but as the normal manifestations of the presence of the Spirit in the assembly of the believers when they have a living faith. The little flock were confirmed in their belief by reports of occurrences in many respects like those of which the apostle Paul speaks in his first letter to the church of Corinth, quoted above — reports which were vouched for as simply true by some members of Mr. Irving's congregation who made an investigation of the phenomena. The scene of these manifestations was a meeting-house at Port Glasgow, Scotland. The gifts displayed were those of "tongues" and "prophesying." The governing body of the Scotch Presbyterian Church deposed Mr. Irving from the ministry, and shortly afterward he died. But his people persisted in their beliefs, and laid the broad foundations of the Catholic Apostolic Church. It has 4 ministries: apostles, prophets, evangelists, and pastors, each comprising 12 members. These 48 preside over the "12 tribes" of the universal Church. Each congregation, normally numbering 500 adult communicants, has its "angel" or bishop, under whom are 24 priests, 6 of each of the 4 orders or ministries of apostles, prophets, evangelists, and pastors, besides elders, deacons for the temporal affairs, and a corps of subdeacons, acolytes, singers, and doorkeepers. In the daily religious services at 6 and 9 A.M., and 3 and 5 P.M., the "low celebration," the matins, the vespers, the "proposition" of the sacrament; the "high celebration" at 10 A.M. Sundays at the "high altar"; the use of vestments, lights, incense, holy oil, etc., in all these respects the Catholic Apostolic Church aims at as pronounced a ritualism as is seen in a Cath-

olic cathedral. The ministry with their coadjutors are supported by tithes contributed by the faithful. The Catholic Apostolic Church has spread abroad widely, claiming to have organizations in Germany, France, Switzerland, Belgium, Russia, Denmark, Sweden, Australia, India, Ireland, and the United States. The statistics of religions compiled for the New York 'Independent' in 1902 show that then it had in the United States, 95 ministers, 10 churches, and 1,394 communicants.

Catholic Benevolent Legion, a fraternal society for Roman Catholic laymen, designed to afford to the members facilities for intellectual improvement, social advancement, and such other advantages as are offered by similar non-Catholic fraternities. It was organized in 1881 and incorporated under the laws of the State of New York with 11 charter members. Twenty years later the society had 50,000 active members, and had paid to widows and orphans of 6,200 deceased members the sum of $12,000,000. The organization is incorporated under the style of The Supreme Council, Catholic Benevolent Legion, and to the Supreme Council final appeal is made on all matters of importance emanating from State or subordinate councils. Male Roman Catholics who are personally acceptable, of sound bodily health, and between the ages of 18 and 55, are alone eligible to membership. There is a relief fund on behalf of sick and distressed members, and a benefit fund, out of which a sum not exceeding $5,000 is paid to the beneficiaries of deceased members, and a sum not exceeding $2,500 to a member who is permanently disabled. A subordinate council of the Catholic Benevolent Legion may be formed in any congregation or parish; a charter is granted by the Supreme Council to a group of 15 or even of 7 eligible persons who associate themselves with a view to enter the fraternity. The organization has the express approval of the Pontiff and of all the archbishops and bishops in whose jurisdictions councils of the fraternity have been formed.

Catholic Church, a phrase signifying the universal Church, the whole body of true believers in Christ; but the term is often used as equivalent to the Roman or Western Church. Like most other words used in ecclesiology, the term Catholic was borrowed at first from the New Testament. It occurs in some editions of the Greek original — including that issued in connection with the last revision — in the titles prefixed to the Epistles of James, 1 and 2 Peter, 1 John, and Jude, and is the word translated "general" in the King James Bible. The first to apply it to the Church was the Apostolic Father Ignatius. When he and his successors used it they meant to indicate that the Church of which they constituted a part, comprised the main body of believers, and was designed, as it was entitled, to be universal. In this sense the Church was opposed to the sects and separate bodies of heretics who had separated themselves from it and were now outside its pale. When, in the 8th century, the separation between the Eastern and Western Churches took place, the latter retained as one of its appellations the term "Catholic," the Eastern Church being contented with the word "Orthodox," still used by the Russian emperors in their politico-ecclesiastical manifestos. When the Protestant churches separated from their communion with Rome in the 16th century, those whom they had left naturally regarded them as outside the Catholic pale. They, on the other hand, declined to admit that this was the case, and the term "Catholic Church" is used in the English Liturgy apparently in the sense of all persons making a Christian profession.

Catholic Church, Beneficent Effects of The. We live and move and have our being in the midst of a civilization which is the legitimate offspring of the Catholic religion. The blessings resulting from our Christian civilization are poured out so regularly and so abundantly on the intellectual, moral and social world, like the sunlight and the air of heaven and the fruits of the earth that they have ceased to excite any surprise except to those who visit lands where the religion of Christ is little known. In order to realize adequately our favored situation we should transport ourselves in spirit to ante-Christian times and contrast the condition of the pagan world with our own. Before the advent of Christ, the whole world, with the exception of the secluded Roman province of Palestine, was buried in idolatry. Every striking object in nature had its tutelary divinities. Men worshipped the sun and moon and stars of heaven. They worshipped their very passions. They worshipped everything except God only, to whom alone divine homage is due. In the words of the Apostle of the Gentiles, "They changed the glory of the incorruptible God into the likeness of corruptible man, and of birds and beasts and creeping things. They worshipped and served the creature rather than the Creator who is blessed forever."

But at last the great Light for which the prophets of Israel had sighed and prayed, and toward which even the pagan sages had stretched forth their hands with eager longing, arose and shone unto them "that sat in darkness and in the shadow of death." The truth concerning our Creator, which had hitherto been hidden in Judea, that there it might be sheltered from the world-wide idolatry, was now proclaimed, and in far greater clearness and fullness, unto the whole world. Jesus Christ taught all mankind to know the one true God, a God existing from eternity unto eternity, a God who created all things by his power, who governs all things by his wisdom, and whose superintending providence watches over the affairs of nations as well as of men, "without whom not even a bird falls to the ground." He proclaimed a God infinitely holy, just, and merciful. This idea of the Deity, so consonant to our rational conceptions, was in striking contrast with the low and sensual notions which the pagan world had formed of its divinities. The religion of Christ imparts to us not only a sublime conception of God, but also a rational idea of man and of his relations to his Creator. Before the coming of Christ, man was a riddle and a mystery to himself. He knew not whence he came or whither he was going. He was groping in the dark. All he knew for certain was that he was passing through a brief phase of existence. The past and the future were enveloped in a mist which the light of philosophy was unable to penetrate. Our Redeemer has dis-

pelled the cloud and enlightened us regarding our origin and destiny and the means of attaining it. He has rescued man from the frightful labyrinth of error in which paganism had involved him.

The Gospel of Christ as propounded by the Catholic Church has brought not only light to the intellect, but comfort also to the heart. It has given us "that peace of God which surpasseth all understanding," the peace which springs from the conscious possession of the truth. It has taught us how to enjoy that triple peace which constitutes true happiness as far as it is attainable in this life; peace with God by the observance of his commandments, peace with our neighbor by the exercise of justice and charity toward him, and peace with ourselves by repressing our inordinate appetites, and by keeping our passions subject to the law of reason, and our reason illumined and controlled by the law of God.

All other religious systems prior to the advent of Christ were national like Judaism, or state religions like paganism. The Catholic religion alone is world-wide and cosmopolitan, embracing all races and nations and peoples and tongues. Christ alone, of all religious founders, had the courage to say to his disciples, "Go teach all nations; preach the gospel to every creature. You shall be witnesses unto me in Judea and Samaria and even to the uttermost bounds of the earth. Be not restrained in your mission by national or state lines; let my gospel be as free and universal as the air of heaven. The earth is the Lord's and the fullness thereof. All mankind are the children of my Father and are my brethren. I have died for all, and embrace all in my charity. Let the whole human race be your audience and the world be the theatre of your labors."

It is this recognition of the fatherhood of God and the brotherhood of Christ that has inspired the Catholic Church in her mission of love and benevolence. This is the secret of her all-pervading charity. This idea has been her impelling motive in her work of the social regeneration of mankind. I behold, she says, in every human creature, a child of God and a brother or sister of Christ and therefore I will protect helpless infancy and decrepit old age. I will feed the orphan and nurse the sick. I will strike the shackles from the feet of the slave and will rescue degraded woman from the moral bondage and degradation to which her own frailty and the passions of the stronger sex had consigned her. Montesquieu has well said that the religion of Christ, which was instituted to lead men to eternal life, has contributed more than any other institution to promote the temporal and social happiness of mankind. Let us briefly review what the Catholic Church has done for the elevation and betterment of society.

1. The Catholic Church has purified society in its very fountain, which is the marriage bond. She has invariably proclaimed the unity and sanctity and indissolubility of the marriage tie by saying with her founder, "What God hath joined together, let no man put asunder." Wives and mothers should never forget that the inviolability of the marriage contract is the palladium of their womanly dignity and their Christian liberty. And if they are no longer the slaves of man and the toy of his caprice, like wives in Asiatic countries, but the peers and partners of their husbands; if they are no longer tenants at will like the wives of pagan Greece and Rome, but the mistresses of the household; if they are no longer confronted by usurping rivals like Mohammedan and Morman wives, but the queens of the domestic kingdom, they are indebted for this priceless boon to the ancient Church, and particularly to the Roman pontiffs, who inflexibly upheld the sacredness of the nuptial bond against the arbitrary power of kings, the lust of nobles, and the lax and pernicious legislation of civil government.

2. The Catholic religion has proclaimed the sanctity of human life as soon as the body is animated by the vital spark. Infanticide was a dark stain in pagan civilization. It was universal in Greece with the possible exception of Thebes. It was sanctioned and even sometimes enjoined by such eminent Greeks as Plato and Aristotle, Solon and Lycurgus. The destruction of infants was also very common among the Romans. Nor was there any legal check to this inhuman crime except at rare intervals. The father had the power of life and death over his child. And as an evidence that human nature does not improve with time, and is everywhere the same unless it is fermented with the leaven of Christianity, the wanton sacrifice of infant life is probably as general to-day in China and other heathen countries as it was in ancient Greece and Rome. The Catholic Church has sternly set her face against this exposure and murder of innocent babes. She has denounced it as a crime more revolting than that of Herod, because committed against one's own flesh and blood. She has condemned with equal energy the atrocious doctrine of Malthus, who suggested unnatural methods for diminishing the population of the human family. Were I not restrained by the fear of offending modesty, and of imparting knowledge where "ignorance is bliss," I would dwell more at length on the social plague of ante-natal infanticide, which is insidiously and systematically spreading among us in defiance of civil penalties and of the divine law which says "Thou shalt not kill."

3. There is no phase of human misery for which the Church does not provide some remedy or alleviation. She has established infant asylums for the shelter of helpless babes who have been cruelly abandoned by their own parents, or bereft of them in the mysterious dispensation of Providence before they could know and feel a mother's love. These little waifs, like the infant Moses drifting on the turbid Nile, are rescued from an untimely death, and are tenderly raised by the daughters of the great King, those consecrated virgins who become nursing mothers to them. And I have known more than one such motherless babe, who like Israel's lawgiver, in after years became a leader among his people.

4. As the Church provides homes for those yet on the threshold of life, so too does she secure retreats for those on the threshold of death. She has asylums in which the aged, men and women, find at one and the same time a refuge in their old age from the storms of life, and a novitiate to prepare them for eternity. Thus, from the cradle to the grave she is a loving mother. She rocks her children in the cradle of infancy, and she soothes them to rest on the couch of death.

Louis XIV. erected in Paris the famous Hôtel des Invalides for the veteran soldiers of France who had fought in the service of their country. And so has the Catholic religion provided for those who have been disabled in the battle of life, a home in which they are tenderly nursed in their declining years by devoted sisters. The Little Sisters of the Poor, whose congregation was founded in 1840, have now charge of 250 establishments in different parts of the globe, the aged inmates of those houses numbering 30,000, and upward of 70,000 having died under their care up to 1889. To these asylums are welcomed not only the members of the Catholic religion, but those also of every form of Christian faith, and even those without any faith at all. The sisters make no distinction of person or nationality or color or creed; for true charity embraces all. The only question proposed by the sisters to the applicant for shelter is this: "Are you oppressed by age and penury? If so, come to us and we will provide for you."

5. She has orphan asylums where children of both sexes are reared and taught to become useful and worthy members of society.

6. Hospitals were unknown to the pagan world before the coming of Christ; the copious vocabularies of Greece and Rome had no word even to express that term. The Catholic Church has hospitals for the treatment and care of every form of disease. She sends her daughters of charity and of mercy to the battlefield and to the plague-stricken city. During the Crimean war I remember to have read of a sister who was struck dead by a ball while she was in the act of stooping down and bandaging the wound of a fallen soldier. Much praise was then deservedly bestowed on Florence Nightingale for her devotion to the sick and wounded soldiers. Her name resounded in both hemispheres. But in every sister you have a Florence Nightingale with this difference, that like ministering angels they move without noise along the path of duty, and like the angel Raphael, who concealed his name from Tobias, the sister hides her name from the world.

Several years ago I accompanied to New Orleans eight sisters of charity who were sent from Baltimore to reinforce the ranks of their heroic companions or to supply the places of their devoted associates who had fallen at the post of duty in the fever-stricken cities of the South. Their departure for the scene of their labors was neither announced by the press nor heralded by public applause. They rushed calmly into the jaws of death, not bent on deeds of destruction like the famous "six hundred," but on deeds of mercy. They had no Tennyson to sound their praises. Their only ambition was — and how lofty is that ambition! — that the recording angel might be their biographer, that their names might be inscribed in the Book of Life, and that they might receive their recompense from him who has said: "I was sick and ye visited me; for as often as ye did it to one of the least of my brethren, ye did it to me." Within a few months after their arrival, six of the eight sisters died victims of the epidemic.

These are a few of the many instances of heroic charity that have fallen under my own observation. Here are examples of sublime heroism not culled from the musty pages of ancient martyrologies, or of books of chivalry, but happening in our own day and under our own eyes. Here is a heroism not aroused by the emulation of brave comrades on the battlefield, nor by the clash of arms or the strains of martial hymns, nor by the love of earthly fame, but inspired only by a sense of Christian duty and by the love of God and of fellow beings.

7. The Catholic religion labors not only to assuage the physical distempers of humanity, but also to reclaim the victims of moral disease. The redemption of fallen women from a life of infamy was never included in the scope of heathen philanthropy, and man's unregenerate nature is the same now as before the birth of Christ. He worships woman as long as she has charms to fascinate; but she is spurned and trampled upon as soon as she has ceased to please. It was reserved for him who knew no sin to throw the mantle of protection over sinning woman. There is no page in the gospels more touching than that which records our Saviour's merciful judgment on the adulterous woman. The scribes and Pharisees, who had perhaps participated in her guilt, asked our Lord to pronounce sentence of death upon her in accordance with the Mosaic law. "Hath no one condemned thee?" asked our Saviour. "No one, Lord," she answered. "Then," said he, "neither will I condemn thee. Go, sin no more." Inspired by this divine example, the Catholic Church shelters erring females in homes not inappropriately called Magdalen asylums and houses of the Good Shepherd. Not to speak of other institutions established for the moral reformation of women, the Congregation of the Good Shepherd at Angers, founded in 1836, has charge to-day of 150 houses, in which upward of 4,000 sisters devote themselves to the care of over 20,000 females who had yielded to temptation, or were rescued from impending danger.

8. The Christian religion has been the unvarying friend and advocate of the bondman. Before the dawn of Christianity, slavery was universal in civilized as well as in barbarous nations. The apostles were everywhere confronted by the children of oppression. Their first task was to mitigate the horrors and alleviate the miseries of human bondage. They cheered the slave by holding up to him the example of Christ, who voluntarily became a slave that we might enjoy the glorious liberty of children of God. The bondman has an equal participation with his master in the sacraments of the Church, and in the priceless consolation which religion affords. Slave-owners were admonished to be kind and humane to their slaves by being reminded with apostolic freedom that they and their servants had the same Master in heaven who had no respect of person. The ministers of the Catholic religion down the ages sought to lighten the burden and improve the condition of the slaves, as far as social prejudices would permit, till at length the chains fell from their feet. Human slavery has at last, thank God, melted away before the noonday sun of the gospel. No Christian country contains to-day a solitary slave. To paraphrase the words of a distinguished Irish jurist: As soon as the bondman puts his feet on a Christian land, he stands redeemed, regenerated, and disenthralled on the sacred soil of Christendom.

9. The Saviour of mankind never conferred a greater temporal boon on humanity than by ennobling and sanctifying manual labor, and by rescuing it from the stigma of degradation which had been branded upon it. Before Christ appeared among men, manual and even mechanical work was regarded as servile and degrading to the freeman of pagan Rome, and was consequently relegated to slaves. Christ is ushered into the world not amid the pomp and splendor of imperial majesty, but amid the environments of an humble child of toil. He is the reputed son of an artisan, and his early manhood is spent in a mechanic's shop. "Is not this the carpenter, the son of Mary?" The primeval curse attached to labor is obliterated by the toilsome life of Jesus Christ. Ever since he pursued his trade as a carpenter he has lightened the mechanic's tools and has shed a halo around the workshop.

If the professions of a general, a jurist, and a statesman are adorned, respectively, by the example of a Washington, a Taney, and a Burke, how much more is the calling of a workman ennobled by the example of Christ! What De Tocqueville said 60 years ago of the United States is true to-day, that with us every honest labor is honorable, thanks to the example and teaching of Jesus Christ.

To sum up: The Catholic Church has taught man the knowledge of God and of himself; she has brought comfort to his heart by instructing him to bear the ills of life with Christian philosophy. She has sanctified the marriage bond; she has proclaimed the sanctity and inviolability of human life from the moment that the body is animated by the spark of life till its extinction; she has founded asylums for the training of children of both sexes and for the support of the aged poor. She has established hospitals for the sick and homes for the redemption of fallen women. She has exerted her influence toward the mitigation and abolition of human slavery. She has been the unwavering friend of the sons of toil. These are some of the blessings which the Catholic Church has conferred on society.

I will not deny, on the contrary I am happy to avow, that the various Christian bodies outside the Catholic Church have been and are to-day zealous promoters of most of these works of Christian benevolence which I have enumerated. But will not our separated brethren have the candor to acknowledge that we had first possession of the field, that these beneficent movements have been inaugurated by us, and that the other Christian communities in their noble efforts for the moral and social regeneration of mankind, have in no small measure been stimulated by the example and emulation of the ancient Church?

Let us do all we can in our day and generation in the cause of humanity. Every man has a mission from God to help his fellow being. Though we differ in faith, thank God, there is one platform on which we stand united, and that is the platform of charity and benevolence. We cannot, indeed, like our divine Master, give sight to the blind, and hearing to the deaf, and speech to the dumb, and strength to the paralyzed limb, but we can work miracles of grace and mercy by relieving the distress of our suffering brethren. And never do we approach nearer to our heavenly Father than when we alleviate the sorrows of others. Never do we perform an act more God-like than when we bring sunshine to hearts that are dark and desolate; never are we more like unto God than when we cause the flower of joy and gladness to bloom in souls that were dry and barren before. "Religion," says the Apostle, "pure and undefiled before God and the Father, is this: to visit the fatherless and the widow in their tribulation, and to keep oneself unspotted from this world." Or to borrow the words of the pagan Cicero: *Homines ad Deos nulla re propius accedunt quam salutem hominibus dando;* ("There is no way by which men can approach nearer to the Gods than by contributing to the welfare of their fellow creatures.")

JAMES CARDINAL GIBBONS.

Catholic Church, Roman. By this name is designated the large body of Christians, united in doctrine and worship under the supreme jurisdiction of the pope, the bishop of Rome. (See PAPACY.) The members of this communion are wont rather to speak of it as the "Catholic Church," but admit the term "Roman" in the sense that "to be Roman is to be Catholic and to be Catholic is to be Roman." They hold that their Church alone possesses in its fulness the system of truths, laws, and practices for the worship of God which was instituted by Jesus Christ (q.v.). Hence a brief statement of Catholic teaching on the origin, nature, and properties of the Church of Christ will enable us to understand why the Roman Catholic Church demands that all men submit to her authority as a teacher, divinely appointed to make known with absolute certainty the conditions of salvation.

From the Four Gospels, considered as trustworthy historical documents, we learn that Jesus Christ was certainly a divine messenger to all mankind, and that therefore all men are bound to receive His message with implicit submission. The doctrine which He teaches may be an enforcement of truths which man might have learned, however imperfectly, by the use of his natural powers, or may include new truths which his natural powers would never have discovered. As Christ did not remain on earth to teach all men in person, He chose a band of apostles, whom He commissioned to preach to all nations the truths He had taught them, promising His assistance unto the end of the world, and imposing upon all men, under penalty of losing their souls, the obligation of receiving His doctrine. The presence of the Holy Spirit was to preserve the Apostles from error and keep them perfectly united in their teaching.

Besides the gift of infallibility (q.v.), He conferred on them jurisdiction over all believers, the right to govern with threefold power, legislative, judicial, and executive. Moreover, they were to sanctify men by certain religious rites, called sacraments (q.v.), and for this purpose received the gift of Holy Orders (q.v.). To Peter (see SAINT PETER), one of the Twelve Apostles, was granted a primacy, not merely of honor, but of jurisdiction. On him was Christ's Church to be built; he was to feed the entire flock, the lambs, and the sheep. By thus organizing a body to teach, govern, and sanctify men under the primacy of Saint Peter, Christ founded a religious society, supernatural in aims and means, and he chose for it the special name,

the Church. (See CHURCH, AN ORGANIZATION OF CHRISTIANS.) This society was to last even unto the day of judgment; its duty was to teach all men, wherefore the Apostles appointed their successors and transmitted to them the authority received from Christ. As the primacy of Saint Peter was the firm foundation, necessary to insure the unity and stability of the Church, it too was to last forever. The power he received was for him and his successors. There never should come a time when the doctrine of Christ would be lost through corruption.

Whence we gather that there exists to-day a religious society, empowered to teach with certainty all the truths of Christianity, and that it is a visible body, united in its government and religious teachings. The members of this society submit to its infallible teaching by profession of the faith, to its sacred ministry by the reception of baptism (q.v.) and to its ecclesiastical rule by obedience. If all men are obliged to enter this society, it is evident that Christ provided some signs, notes, or marks by which His Church can become known to all earnest inquirers, by which it can be distinguished from other associations. Christ intended that His Church should be known by Unity. It was to be one in faith, one in government, one in worship, and one in the charity uniting all its members. It was to be known by Holiness. The Church is holy in its Founder; in its aim to lead men to God; in its means of sanctification, in the heroic virtue of many members, and in the permanence of miracles among them. It was to be Catholic; that is, conspicuously diffused everywhere. Finally it was to be Apostolic. The governing and teaching body is the continuation of the Apostolic body to which Christ gave His mission and with which He promised to remain until the end of time. Whoever is not in communion with the successor of Saint Peter cannot possess union with the Apostolic body. The obligation of becoming a member of the Church is often expressed in these words: "Out of the Church there is no salvation." They do not mean that all who die out of the visible communion are lost. God does not inflict punishment but for a wilful fault, and those who without fault cannot see their obligation of joining the Church, are not to blame. If, however, anyone, knowing this obligation, refuses to comply with it, he puts himself out of the way of salvation. The same holds true for those who neglect to examine properly into a matter of so great importance.

Catholics hold that the marks of the true Church of Christ are found only in the Church in which the bishop of Rome holds the primacy. The bishops of this Church all over the world are the successors of the apostles, possessing the right to teach, to rule, and to sanctify. The gift of infallibility, that is, the right to declare that certain doctrines have been revealed by God is not personal to each bishop, but belongs only to the whole body of bishops, whether gathered in general council or not. The consent of the universal Church according to Christ's promise is a sure criterion of revelation. To the Bishop of Rome as the successor of Saint Peter belongs the primacy of jurisdiction over the whole Church, complete, supreme, ordinary, and immediate over each and all the churches of the world, over each and all the bishops and the faithful.

In this primacy is included the supreme authority as teacher of the Church, or the prerogative of papal infallibility. By virtue of a special supernatural assistance of the Holy Spirit promised to Saint Peter and his successors, the pope cannot err when, as supreme teacher of the universal Church, he defines a doctrine concerning faith or morals to be held by the whole body of the faithful. Only when these four conditions are fulfilled is the pope infallible: First, he must speak not in his private capacity, not merely in his official character, but as supreme teacher. Secondly, the matter defined must concern faith or morals. Thirdly, the judgment must be delivered with the manifest intention of commanding intellectual assent. Fourthly, the definition must be given to the whole body of the faithful. It is clear that infallibility has absolutely no connection with the pope's personal qualities and is entirely distinct from impeccability, or incapability of sinning. The extent of papal infallibility is the same as that of the Church's infallibility. It embraces all the truths that God has revealed as the object of faith, and extends to other truths and matters of faith without assurance of which it would be impossible or very difficult to preserve the deposit of revealed truth.

It follows from what we have hitherto said that whoever wishes to know Christ's doctrine must appeal to the living authority. The Church as teacher, that is, the bishops now living in union with the pope, can alone tell us what doctrines were revealed. This knowledge is not acquired from new revelations, but with the assistance of the Holy Ghost from various sources, chief among which is the preaching of the Gospel, by which the doctrines of Christ are handed down as a sacred heritage from age to age. Thus, even if nothing had ever been written, we should have to-day, uncorrupt and infallible, the means of preserving religious truth which Christ established, namely Tradition. However, it was natural that those who were commissioned to teach should also set down their teaching in writing. Hence we possess many documents and monuments from which we learn what the Church taught in past ages and what it now teaches; the truths revealed remain unchanged. Moreover, we learn from the Church that God Himself provided, by means of men, certain writings, containing revealed truth, and gave them to the Church for the instruction and direction of the faithful. (See BIBLE.) From it alone we learn what books have been so inspired and constitute Holy Scripture; the Church alone can authoritatively interpret these writings. Tradition, therefore, is prior to the Christian scriptures both in time and in thought. It is wider in its scope, for it embraces Scripture as an instrument by which tradition is handed down and on the other hand contains matters which are not in Scripture. First and principally, tradition teaches us the authoritative character of Scripture itself. Even were all the copies of Scripture destroyed, the living voice would still proclaim the entire Christian teaching. Catholics yield to none in their esteem of Holy Writ, as the inspired word of God, but they so esteem it because of what they learn concerning it from tradition. The chief sources from which this tradition is learned are the acts of councils, the writings of the

popes, of the Fathers of the Church, inscriptions, monuments, pictures, liturgies, rites, and pious customs, in a word, every way in which the Church is wont to profess her faith.

The Chief Doctrines of the Catholic Faith.— Catholics believe in one, true, living God, the Creator and Lord of heaven and earth and of all things visible and invisible, almighty, eternal, immense, and incomprehensible; infinite in will and intellect, and in all perfection, who, being one, singular, absolutely simple and unchangeable spiritual substance is to be regarded as distinct really and in essence from the world, infinitely happy in and from Himself and unspeakably elevated above all things that exist or can be conceived. He knows all things in the most perfect manner, by one all-embracing act of His intellect, from eternity to eternity ever the same. He knows His own being, all things that are possible, past, present, and future, and all things that are not and never have been nor will be, but which would be if some condition were fulfilled. He is all-wise, all-holy, all-just, true, faithful, and bountiful. Moreover, in God as there is one divine nature, so there are three divine persons, Father, Son, and Holy Ghost, really distinct from one another, perfectly equal to one another. Nevertheless there are not three Gods, but one God. The Father is unbegotten, the Son is begotten of the Father, and the Holy Ghost proceeds from the Father and the Son. (See TRINITY, DOCTRINE OF THE.) This one true God of His goodness and by His omnipotent power, not in order to increase His happiness, not to acquire perfection, but to manifest it by the good which He imparts to His creatures, in accordance with His absolutely free decree, at once from the beginning of time framed out of nothing as to the whole of their substance, two kinds of creatures, spiritual and material, the angels and the world, and then man, in whom spirit and matter were united. God preserves and governs by His providence all things that He has created.

To the angels He gave sanctifying grace and with it the power to merit eternal happiness by free service. Many of them rebelled and were cast into everlasting fire, the rest were confirmed in grace and admitted to the beatific vision of God. God "formed the body of the first man out of the slime of the earth." He created his soul immediately, as He creates the soul of every man; the soul is a spirit, endowed with intellect and free-will, and immortal. All men are descended from Adam (q.v.) and Eve. Like the angels, our first parents were also raised to a supernatural state by the infusion of sanctifying grace into their souls, being made adopted children of God, destined to the enjoyment of the beatific vision. This is the principle of supernatural life, whereby man can produce works that merit a heavenly reward. Moreover, God bestowed on man other preternatural gifts: great powers of mind and infused knowledge, complete control of the passions, immortality, and exemption from suffering and decay. This original justice our first parents lost by mortal sin, that is, by a grievous, wilful violation of God's law; in consequence of Adam's sin all of his descendants were deprived of those privileges, are conceived in original sin, and cannot of themselves enter the kingdom of heaven.

To atone adequately for the grievous insult to God and to repair the evil done to mankind, the second person of the Trinity became man. Jesus is true God and true man, one Divine Person subsisting in two natures, divine and human, not by the conversion of Divinity into flesh, but by the assumption of humanity unto God. He was born of the Virgin Mary, who was truly the Mother of God and remained a Virgin in conceiving and bearing her divine Son and ever after till the end of her life. By singular privilege of God through the merits of Christ, the Redeemer, the Blessed Virgin was preserved free from original sin (q.v.), that is, in the first moment of her conception, when her soul was created, it was endowed with sanctifying grace. By further privilege she was never guilty of any actual sin, mortal or venial. See MARY; IMMACULATE CONCEPTION.

Christ, the God-man, became our Redeemer, not by the mere effect of His preaching and example, but by His bloody death on the cross. He made Himself our mediator with His Father, offering atonement for the sins of all men. This satisfaction is not applied to those who have use of reason without their free employment of the means ordained by Christ. He merited for us the remission of sins, sanctifying grace, and all other graces conferred on man. After His death, He rose again on the third day, ascended into Heaven, where He sits at the right hand of the Father, whence He shall come with glory to judge the living and the dead, and of His kingdom there shall be no end. He founded a Church and confided to it the task of teaching His doctrines and applying to men's souls the means of sanctification. This Church is the guardian and interpreter of revelation; for though the existence of God can be known with certainty by the light of reason, it has pleased the Divine Wisdom to reveal many natural truths as well as all those that regard our supernatural life. This revelation is contained both in written books and in unwritten traditions. The books of the Old and New Testament, held by the Church to be sacred and canonical, were written by the inspiration of the Holy Ghost and have God as their author. In matters of faith and morals the true meaning of Scripture is that which is maintained by the Church. All interpretations at variance with the unanimous consent of the Fathers, when they speak as witnesses of tradition, are false and forbidden.

Whatever is presented to us by the Church as revealed truth must be accepted by the free assent of the intellect, not because of its intrinsic truth seen by the light of reason, but on the authority of God who has given the revelation, and who can neither be deceived nor deceive. This divine revelation has been made credible by external proofs, especially by miracles and prophecies; yet as faith is a supernatural virtue, the act of faith requires the assistance of divine grace, enlightening the intellect and strengthening the will and making our act supernatural. Without faith there is no justification, but as God wishes all men to be saved, all receive, either proximately or remotely, the grace to believe. Among revealed truths some are mysteries that cannot be demonstrated by human reason, but must be believed. The demonstrations of reason cannot contradict

revelation, hence any assertions of human science that are at variance with what the Church teaches to be revealed must be false.

As grace is necessary for the beginnings of faith, and even for the pious affection toward believing, so it is needed to make our good works deserving of a supernatural reward. Grace is needed even for the just to avoid sin. Final perseverance is a special privilege of dying in the state of grace. Apart from a special revelation, no one can know that he will receive this blessing. Without grace, however, it is possible to resist less urgent temptations and perform acts that have natural goodness; hence all works done before justification are not sins. According to Catholic doctrine, actual grace is a real influence exerted by the Holy Ghost upon the soul, but it does not destroy the free-will of man. A grace may be fully sufficient for a supernaturally good act, but if a man refuse to act with it, the grace will not be efficacious. God will not save us without our co-operation. See GRACE OF GOD.

Actual graces aid us to obtain habitual or sanctifying grace, that is, to be justified by the remission of original sin or of grievous actual sin. This sanctifying grace makes us like unto Christ, holy and supernaturally pleasing to God, and brings with it the infused virtues and the gifts of the Holy Ghost (q.v.). There are many grades of habitual grace; it may be increased by good works, and on the other hand may be entirely lost by mortal sin. God in His mercy offers to man supernatural happiness and makes this offer known by the preaching of His Church, which he accompanies by an interior stirring grace. When a man co-operates with this grace, he believes the truth with absolute certainty and is moved by the thought of God's love; he sees reasons to fear God's justice and throws himself on God's mercy, trusting in the merits of Christ; hence he conceives a love of God and a detestation of sin. Thus by the working of grace and the co-operation of man's free will, the way is prepared for justification; and, provided that man puts no obstacle, the Holy Ghost works this justification by infusing charity into his soul, thereby destroying sin. Thus purified, he enters on a virtuous life, hoping by the merits of Christ to enter heaven, but he has no absolute certainty of his salvation.

In the process of justification, the first grace cannot be merited at all; for no supernatural reward is due to natural acts. With the aid of grace both sinners and just can merit further actual grace, but only congruously and not with any strict right in justice. The just, that is, those in a state of grace, can merit final perseverance congruously, and, because of God's promises, can merit in justice the increase of habitual grace, eternal life, and increase of glory. By mortal sin, all merit is lost.

As a means of justification Christ has entrusted to His Church seven Sacraments (q.v.), or sensible rites, instituted by Him to effect in the soul the grace which they signify. When the necessary conditions are placed, the Sacrament works by its own efficacy and not through the piety of the minister nor of the recipient. The Sacraments are Baptism, Confirmation, Holy Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. Baptism and Penance remit sin; the others cannot lawfully be received in mortal sin. Baptism, Confirmation, and Holy Orders can be received only once, because they imprint on the soul an ineffaceable mark, called the sacramental character. All the Sacraments, if properly received, give sanctifying grace or increase it, if already in the soul. Since the promulgation of the Gospel, justification cannot be obtained without Baptism of water, which blots out original sin and all actual sin. Infants who die without Baptism cannot enjoy the supernatural vision of God. In adults, when baptism of water cannot be received, pardon of sin can be obtained by the baptism of desire, which consists in a perfect love of God and a sorrow for sin, including, at least implicitly, the desire of the Sacrament. Remission of sin is also granted to all who suffer martyrdom for Christ. Sins committed after baptism are remitted by the Sacrament of Penance (q.v.), in which the sinner confesses with contrition all his mortal sins to the duly authorized priests of the Church, from whom he receives absolution. Sins are also remitted by perfect contrition, but the obligation of Divine Law requires that even then, if possible, they must be confessed. Penance pardons the guilt of sins confessed and repented of, infuses or increases sanctifying grace, remits eternal punishment, if it was due, secures actual graces to avoid sin in future, and may also remit, wholly or in part, the temporal punishment still to be undergone for sins the guilt of which has been pardoned. The whole punishment is not always remitted with the fault; for the remaining debt satisfaction is made to God by sufferings patiently borne or voluntarily inflicted. For this purpose also the Church has the power of granting indulgences, which are not a remission of sin, much less a permission to commit sin, but the remission of the whole or part of the temporal punishment which may be due for sins, after the guilt has been pardoned. See INDULGENCE.

In the Holy Eucharist there is really and substantially present the Body and Blood, Soul and Divinity of our Lord Jesus Christ, under the appearances of bread and wine. By the words of the priest at the consecration, there is effected a conversion of the whole substance of the bread into the Body and of the whole substance of the wine into the Blood, which conversion is called transubstantiation (q.v.). By force of the words, the Body is under the species of the bread and the Blood under the species of the wine, but in virtue of the natural connection and concomitance by which the parts of Christ are linked together, He exists whole and entire under each species and every part of the species. In the Mass (q.v.) there is offered to God a true, proper, and propitiatory sacrifice for the living and the dead. To offer up this sacrifice, Christ instituted a visible and external priesthood and the Sacrament of Holy Orders (q.v.); the minister of this Sacrament must be a bishop, who has received the fulness of the sacred ministry. The various orders constitute the Hierarchy. Priests cannot ordain or confirm. Other orders are the diaconate, subdiaconate, and the minor orders (Acolyte, Exorcist, Lector, and Ostiarius). Before the minor orders, the tonsure is conferred as a sign of enrolment among the clergy, who are separated from the rest of the faithful, called the laity. The right to exercise the sacred functions within appointed limits is

called jurisdiction; it is required for the lawful performance of all functions and for the validity of some The Roman pontiffs have, by Divine institution, universal jurisdiction. The other bishops have power to govern the dioceses to which they have been assigned by the pope.

Marriage between Christians was raised by Christ to the dignity of a sacrament. Its essence lies in the contract freely made between man and wife; the grace conferred is first an increase of sanctity, and, secondly, actual grace to fulfill the duties of the married state. The bond of Christian marriage after consummation is absolutely indissoluble; it is also exclusive, no man can have several wives, no woman several husbands, at the same time. Those who, with the aid of God's grace, fulfil the obligations of virginity or celibacy live in a state more holy and better than the state of matrimony. From the fact that Christian matrimony is a Sacrament, it follows that it has been intrusted to the Church and is subject to the laws of the Church, not to those of the State; hence the Church has the power of assigning conditions necessary for the validity or lawfulness of the contract between those who have been baptized. See MARRIAGE.

The means of sanctification are given to men to enable them to live and die in the state of sanctifying grace. At the hour of death each soul is judged by Christ, and if in mortal sin, is condemned to hell to be punished by eternal torments, varying in intensity according to the degree of guilt. Those who die free from all sin, mortal and venial, and from all the temporal punishment for sin, are admitted at once to life everlasting, to perfect beatitude in the vision of God. The saints and angels in heaven offer up prayers for men, and it is good and useful to invoke their intercession that we may obtain favors from God through Jesus Christ, who is our sole Redeemer and Saviour. Catholics honor and worship the saints and angels, and especially the Blessed Virgin Mary, because God loves and honors them, and because of their own personal sanctity; not, however, with the supreme worship that belongs only to God. Because of their special connection with holy persons, honor is also given to relics of the saints, to images and paintings of Christ and His saints. If men die in venial sin, or temporal punishment be still due, their souls are detained in Purgatory (q.v.) until expiation is made. In this state they can no longer merit for themselves, but can be assisted by the prayers and good works of the faithful and particularly by the holy sacrifice of the Mass. The Church has the power to apply indulgences for their relief. In addition to the particular judgment, immediately after death, there will be a general judgment at the end of the world. The body will rise from the grave reunited to the soul, and share for eternity either happiness in heaven or punishment in hell.

The chief duties of Christian life are expressed in the Ten Commandments of God and the commandments of the Church. Many laws have been imposed by the Church on particular classes or for special purposes; all Catholics, however, are bound, under pain of mortal sin, to hear Mass and rest from servile work on Sundays and Holydays of obligation, to fast and to abstain from certain food on the days appointed, to confess all mortal sins at least once a year, and to receive the Holy Eucharist during the Easter time.

A Catholic must believe all the truths God has revealed and teaches through His Church. Denial of one such would mean either the denial of God's veracity or of the Church's infallibility. But it is not necessary that he should know explicitly more than the principal truths; all others are included in his acceptance of the Church as a divine teacher, alone capable of declaring what truths are contained in the *deposit of faith* handed down from the apostles. The definition of a dogma by the Church brings no change in doctrine; for no truth once taught as of faith is ever given up nor can any point be added which was not contained, at least implicitly, in the original teaching. However, the Church's infallibility is not limited merely to revealed doctrines; she can also speak infallibly on matters necessary to safeguard revealed teaching. Belief in such decisions is called ecclesiastical faith. Outside the domain of divine or ecclesiastical faith, there are many subjects of pious belief among Catholics. Some of these may perhaps belong to the deposit of faith, but they are not yet authoritatively proposed. Others depend on human testimony, and are accepted with that degree of certitude which the testimony warrants.

In the expression of revealed truths and in the defense of faith from the charge of conflict with demonstrated truths of science and philosophy, the Church makes use of terms derived from the philosophy current among its subjects. Thus it has come about that the dogmas are expressed in the terms of scholastic philosophy and officially in the Latin language. As its doctrines can be taught in any language, so, too, the expression of them may be harmonized with whatever is found to be true in any system of philosophy.

In the worship, liturgies, discipline, and practices of the Church, some regulations may be of divine origin, others are of ecclesiastical origin, and still others arise from the voluntary piety of individuals. Besides the ordinary obligations of Christian life, she invites those of her children who feel the call from God to bind themselves by vow to His service. The principal vows are those taken to observe the evangelical counsels of poverty, chastity, and obedience. Those who have thus bound themselves in approved congregations or religious orders are called *religious.* (See ORDERS, RELIGIOUS.) As a matter of discipline all those in Sacred Orders in the Latin portion of the Church are bound to observe celibacy. In the Greek portion, to-day, no priest can marry, but married men may receive Holy Orders, except episcopal consecration.

External Organization of the Church.— Supreme jurisdiction, as we have seen, resides in the Pope; the bishops are the rulers of dioceses, which are subdivided into parishes or missions under a parish priest or rector, assisted by curates. The dioceses are united into provinces, over each of which is an archbishop or metropolitan, the other bishops being called his suffragans. The archbishop convokes provincial synods, hears certain appeals from the episcopal court, watches over the observance of ecclesiastical law in some particulars, and, under certain circumstances, appoints an administrator when a

suffragan dies. The patriarchate is to-day only an honorary rank. The Pope is represented in some countries by apostolic delegates, to whom are referred appeals from the lower courts and through whom the Pope sends his communications. In some countries there are apostolic nuncios, who deal directly with the various governments that have their representatives at Rome.

The Pope is assisted immediately by the Sacred College of Cardinals and by the Sacred Congregations. The College of Cardinals, when complete, contains 70 members: 6 Cardinal Bishops of the Suburban Sees, 50 Cardinal Priests, and 14 Cardinal Deacons. The Sacred Congregations, 21 in number, are committees of Cardinals to whom special affairs are entrusted. They were arranged, almost as at present, by Pope Sixtus V. The Cardinals alone cast votes for the final decisions, but they are assisted by secretaries and consultors. The Pope himself acts as prefect of some congregations (the Inquisition, the Apostolic Visitation, and the Consistorial). A Cardinal presides over each of the others. The acts of all congregations are submitted to the Pope for his approval. These acts, unless promulgated in a solemn manner as the acts of the Sovereign Pontiff himself, are subject to change; though not infallible, they must be received by the faithful with an internal assent, such as is due to religious authority and obeyed as laws of the Church. The more important congregations are: the Holy Roman Inquisition (the supreme tribunal to judge of heresy and crimes allied with heresy), the Consistorial (which selects the matters that are presented and sanctioned by the College of Cardinals assembled in the Papal Consistories), the Apostolic Visitations, Bishops and Regulars, the Council of De Propaganda Fide (which cares for missionary countries), Sacred Rites, the Index (which prohibits the reading of books condemned as contrary to faith or good morals), Indulgences and Relics, and the Congregation of Studies.

The Church and Civil Authority.— The Church was established by Christ as a perfect, independent religious society. Its authority depends on God's ordinances alone; wherefore it has always denied any right on the part of the state to interfere in its internal affairs. In Catholic countries, the Church claims immunity for its officials from the authority of civil tribunals; in past ages this immunity was often absolutely necessary for their just protection. Sometimes the Pope makes a Concordat with temporal rulers: that is, a treaty whereby, in consideration of certain promises of these rulers, the Pope abstains from urging certain of his rights. To exercise the prerogatives which we have described, the Pope, his Cardinals, and other officials must be exempt from the jurisdiction of any civil tribunals. Practically this cannot be secured without the Temporal Power (q.v.), or better, the Temporal Independence of the Sovereign Pontiff. It is not enough for the Pope to be free, he must be known to be free: suspicion of being under the influence of a sovereign would be fatal to his influence. This independence he possessed for more than 15 centuries; it was assured by the recognition of his sovereign authority in the states of the Church. Since the usurpation of these states by the Italian government, the Popes, Pius IX., Leo XIII., and Pius X., have not ceased to proclaim: (1) that this seizure was an act of injustice; (2) that the Pope no longer possesses the freedom, security, and independence demanded by his dignity, his rights, and for the proper exercise of his authority; and (3) that the Holy See must insist on these facts and look forward to some efficient remedy for the injustice and indignity of present conditions. To deal rightly with Catholics of all nations, the Pope must be extra-national. As the seat of our general government, the District of Columbia, is independent of all the States, so the seat of the general government of the Church should be independent of all the countries of the earth.

History.—The history of the Roman Catholic Church may be divided into three great epochs: (1) Christian Antiquity, embracing the first seven centuries, during which Christian civilization was chiefly Greek and Roman. (2) The Middle Ages, from the 8th century to the 16th, characterized by the Church's action among the various peoples of north and central Europe, who were molded into organized nations by her influence. (3) The Modern Age, from the rise of Protestantism to the present day, during which the Germanic nations separated from the Church and attached themselves to various sects, and the Church has had to struggle against the modern, infidel spirit in science and government.

The first epoch contains two periods. First comes an era of persecution, during the struggle with paganism, which was terminated by the edict of Milan (313); then, an era of development in definitions of dogma against the attacks of heresy. The second epoch embraces four periods: I. The conversion of the barbarians. II. The development of the Western Empire and the Church's struggle to maintain her independence (800–1073). III. The supremacy of the Church maintained (1073–1300). IV. Attacks on the Church's supremacy, from Boniface VIII. to Protestantism.

During the third epoch three periods may be distinguished: I. The period of religious warfare, ending with the Peace of Westphalia, 1648. II. From 1648 to the French Revolution: the era of established Churches. III. Down to the present day: Neo-paganism in science and life, the age of unrestrained freedom to accept or deny the truths of religion.

Even while the Church was undergoing cruel persecution, she was also developing her discipline and defending her doctrines against the pagans and heretics. From the first three centuries have come down to us the valuable works of Ignatius, Polycarp, Justin, Clement of Alexandria, Origen, Tertullian, Cyprian, and many others. The mightier struggle with heresy, and her marvelous growth after she emerged from the catacombs, gave renown to Athanasius, Basil, the Gregories in the East and West, Chrysostom, the Cyrils, Hilary, Ambrose, Jerome, Augustine, Leo, and a host of other Christian writers, of whose works the modern world knows very little. The growth of monasticism (q.v.) is one of the glories of this age. Monks and nuns consecrated their lives to God's service by prayer and study and labor, thus preserving the ancient civilization from utter destruction by the barbarians, and preparing for the Church the means of converting these barbarians and transforming them into the

civilized communities of Europe. The intimate union which existed between Church and State gave rise to the Holy Roman Empire (q.v.) and to the great body of laws by which their mutual relations were regulated. Frequent attempts were made later to subject the Church to the Empire. They were frustrated by the Popes, and especially by Gregory VII., after whom comes the glorious period of vigorous life and eminent learning. Among the orders that were then founded we may mention the Carthusians, Cistercians, Franciscans, Dominicans, and Servites, fruitful in numerous saints and scholars. The Church boasts of Saint Anselm, Peter Lombard, Albertus Magnus, Saint Thomas Aquinas, Saint Bonaventure, Duns Scotus, Saint Bernard, and others. It was also the age of Crusades (q.v.) for the recovery of Palestine. The 14th and 15th centuries are noted for the revival of interest in pagan literature, the sad exile of the Popes at Avignon, and frequent movements to effect a much-needed reformation of morals. In this work, many rejected the divine authority of the Church and were cast out as heretics; they are generally regarded as forerunners of Martin Luther (q.v.), who succeeded in separating whole sections of Germany from the Church, and became the occasion for the counter reformation that was effected by men like Francis de Sales, Ignatius Loyola, and Peter Canisius during the 16th century, and especially by the great work of the Council of Trent (1545–63). At this same period, millions of pagans were brought into the Church by the heroic labors of her missionaries, notably in South America, India, Ethiopia, and Japan. England, under Henry VIII. and Elizabeth, renounced the supremacy of the Pope, made a state religion of its own, and by the penal laws almost annihilated the Catholics. France remained Catholic, but, becoming infected with Jansenism and Gallicanism (qq.v.), and later with atheism and socialism, brought about the utter disorganization of Continental society. In the reconstitution of the shattered nations, Napoleon (q.v.) thought to make the Papacy his tool, and thus ruin the Church; but he failed, and the 19th century witnessed the gradual revival of the Church in almost all European countries, and its stupendous growth in the United States and other English-speaking countries. Catholic emancipation in England (1829), the Tractarian movement (see TRACTARIANISM) in the Established Church, that resulted in so many converts to Rome, and the restoration of the Catholic hierarchy (1850), have given Catholics prominence in English life. In France, though the people are loyally Catholic, the government is engaged in controversy with the Church and in the attempt to control Catholic education. When the French garrison was withdrawn from Rome in 1870, the Papal states and the city of Rome were annexed and added to the Italian kingdom. For the past 34 years the Pope has never left the Vatican Palace. Shorn of their earthly kingdom, Pope Pius IX. (q.v.) and Leo XIII. (q.v.) witnessed the attempt of Bismarck (q.v.), in Germany, to subject the Catholic Church to the State; but they witnessed also the failure of the attempt and the repeal of almost all the iniquitous laws. Persecution served only to unite all Catholics and revealed to them the power of united action. In the United States the Church has grown from 244,500 in 1820 to 12,000,000 or 13,000,000 in 1900. This great increase has been due mainly to immigration from Europe and Canada. Irish, Germans, French Canadians, Italians, Poles, and Bohemians have come in large numbers. Meeting with no official opposition, the Church has prospered and is regarded even by many non-Catholics as a strong power for the preservation of the republic from the new social dangers that threaten the United States as well as the whole civilized world.

The activity of the Church in the mission field was almost destroyed by the wholesale confiscations of the French Revolution. As soon as order had been established in Europe, the missions revived, and, especially since Gregory XVI., have spread to every land of the world. Dioceses are mapped out and bishops appointed as soon as the circumstances warrant. The reorganization of the Congregation *De Propaganda Fide* by Pius IX., with separate sections for the Latin and the Oriental Churches, has been of great advantage. Colleges, institutes, and special religious congregations have been founded in various cities of Europe for work in the foreign missions. The Association for the Propagation of the Faith is the largest of the societies among the laity for the collection of funds. Missions are also conducted with success in the Oriental Churches in communion with the Holy See. These Churches hold the same doctrines as the Latin Church, but have special rites, discipline, and liturgical language. There are four chief groups: I. The Greek, subdivided into Greek proper, Melchite, Slav (which is Ruthenian and Bulgarian), and Rumanian. II. The Syrian, subdivided into Syrian proper, Syro-Chaldean (which also included the Malabar) and Maronite. III. The Coptic, which is Egyptian and Abyssinian or Ethiopian. IV. The Armenian. Pope Leo XIII. was much interested in these eastern churches, and had the joy of receiving many converts into communion. See MISSIONS, ROMAN CATHOLIC.

Statistics.— The number of Catholics throughout the world, according to the latest computations given by H. A. Krose, S.J., in the 'Stimmen aus Maria Laach,' July-August 1903 (republished in the 'Catholic World,' New York, February 1904), is 264,505,922. They are distributed as follows: Asia, 11,513,276; Africa, 3,004,563; Australia and Oceanica, 979,943; America, 71,350,879; Europe, 177,657,261. These numbers, according to the compiler, represent less than the whole number of Catholics, on account of the impossibility of obtaining official reports. He believes that there are at least 270 millions. For America the following numbers are given:

British North America, 2,301,693; United States, 10,976,757; Central America, 16,150,946; West Indies, 4,964,481; South America, 36,957,002; total, 71,350,879. In the Philippine Islands there are 6,599,998 Catholics. The number of Catholics assigned to the United States is regarded by the ecclesiastical authorities as too low; it is variously estimated at thirteen or fourteen millions. The following table gives the estimated number in the chief countries of Europe:

Austria Hungary, 35,570,870; Belgium, 6,660,000; Denmark, 5,373; France, 38,180,000; German Empire, 20,321,441; Great Britain, 2,-

000,000; Greece 34,710· Ireland 3,500,000· Italy, 32,300,000; Holland, 1,790,161; Norway, 1,969; Portugal, 5,277,000; Russia and Finland, 11,326,804; Sweden, 1,390; Switzerland, 1,383,135; Spain, 18,200,000; Turkey and Crete, 300,000.

JOHN J. WYNNE, S.J.,
Editor of 'The Messenger.'

Catholic Colleges in Europe, American. (1) The Pontifical College of the United States at Rome, Italy. This institution was founded by Pius IX., and was formally opened by him 8 Dec. 1859. In 1884 Leo XIII. ranked it among pontifical colleges, with the privileges thereto appertaining. Ecclesiastical students only are admitted; students pursuing the courses in the humanities, philosophy, and theology at the Urban College of the Propaganda. In 1904 the number of students was reported as 97. (2) The American College at Louvain, Belgium. This was founded in 1857 by several American bishops. The rules and constitutions were confirmed by Leo XIII. in 1895. The objects of the institution are to educate for the priesthood American students sent by their bishops to Louvain, and to prepare students from Belgium and adjacent countries for important missions in dioceses of America. Only those students are admitted who have finished a complete course in philosophy at a Catholic college. There is a three years' course in theology at the University of Louvain, followed by higher studies leading to the various degrees in theology and canon law.

Catholic Copts, those native Egyptian Christians, about 5,000 in number, who acknowledge the authority of the Pope. One of their priests was made a vicar apostolic and bishop *in partibus* (residence at Cairo) in 1855; in 1895 Leo XIII. established over them a hierarchy, the head of which has the designation "Patriarch of Alexandria of the Copts."

Catholic Creditor, in Scots law, a creditor whose debt is secured by a lien or charge on more than one subject belonging to the debtor.

Catholic Education. See EDUCATION, ROMAN CATHOLIC; CANADA — CATHOLIC EDUCATION.

Catholic Emancipation Act, an act of the British Parliament passed in the 10th year of the reign of George IV., 13 April 1829, by which the Catholics of Ireland were relieved of civil disabilities still persisting there after the more odious and oppressive provisions of the penal laws enacted in 1691, in violation of the stipulations of the Treaty of Limerick, had been gradually done away. For 50 years after 1691 those laws were enforced vigorously; from that time to the era of emancipation there was a gradual relaxation. The design of those penal laws was the extermination of the Catholic religion in the island and the administration of the government purely for the behoof of the "Protestant interest" and the "English interest." A Catholic was not permitted to be a landowner, nor even to hold land on lease, save for a brief term; the son of a Catholic could, by making profession of the Protestant religion, come into possession of his father's property, allowing to his parent an annuity; if a Catholic owned a horse, whatever its value, any Protestant might legally seize it on paying to the owner $25; no Catholic priest could lawfully exercise his ministry in Ireland save under severe restrictions, and monks and friars were regarded as felons and punished as such; no Catholic could be a barrister, nor a schoolmaster; Catholics were ineligible to the Parliament of Ireland, or even as electors: they were not permitted to be freemen of boroughs. When the act of union of the kingdom of Ireland with that of Great Britain was passed William Pitt gave solemn assurance to the Catholics of Ireland that the last of their disabilities would be forthwith removed, and bills to that effect were brought into Parliament; but Pitt, giving way before the insane bigotry of King George III., did not press the measure and went out of office. The Catholics continued to demand their enfranchisement and emancipation, and their appeals were heard in the British Parliament; but it was seen that the hope of redress of grievances was vain unless a show of force was made, or a popular agitation set on foot. Daniel O'Connell, already a highly successful counselor-at-law, though not a barrister, owing to his disability as a Catholic, took the leadership of the Catholics of Ireland, and from 1824 till the act of emancipation was passed, Ireland was the scene of an unprecedented popular agitation, never equaled in any country till the agitation for the repeal of the union with Great Britain was set on foot immediately after the grant of Catholic emancipation. The British cabinet was alarmed by the outburst of popular enthusiasm in Ireland, and the House of Commons in 1825 passed a relief bill for Ireland, but the lords rejected it. A second relief bill, two years later, failed in the House of Commons. But the following year, 1828, the House, although the cabinet (Wellington's) was adverse, passed that second bill. This gave the cabinet and even the king (George IV.) pause, and it was confessed that really something might or must be done; but the agitation must cease. The reply of the Irish Catholics was to nominate O'Connell, despite his legal disability, for membership in the Parliament and to elect him triumphantly. He was a member of Parliament-elect, but he would not take the oath whereby he must accept the king's supremacy in religion. It was the king and the cabinet that had to retreat now. The bill for Catholic emancipation was brought into the House of Commons on 5 March 1829, and passed the first reading by a

majority of 188 in a House of 508 members; on the second reading the majority was 180; and on the final vote it was 178 in a House of 462. Even in the lords the measure was passed by a good majority, and the bill received the king's assent. The rights and privileges accorded to the Catholics of Ireland by this act were: that they were not to be required to take the oath of supremacy; that they became admissible to all offices in corporations and to enjoyment of all municipal rights. But no Catholic could be regent or lord chancellor, either of Great Britain or of Ireland; and they were incapable of holding offices connected with the Established Church or the universities. In all other respects the Catholics were to stand on an equal footing with Protestants.

Catholic Epistles, those letters in the New Testament which are addressed to the faithful in general, not to particular churches, as is that to the Philippians, that to the Ephesians, etc.; nor to individuals, as are the epistles of Paul to Timothy, Titus, etc. The catholic or general epistles are those of James, 1 and 2 Peter, 1 John, and the epistle of Jude. These same epistles are also styled Canonical, signifying, according to Calmet, that they contain excellent rules (*canones*) of faith and morals.

Catholic Indian Missions, Bureau of, an organization of the Roman Catholic Church, established in 1874 by the archbishop of Baltimore in behalf of Catholic prelates having Indian missions within their respective dioceses, in order to represent before the Government the interests of these prelates in all matters appertaining to Indian affairs. By decree of the 3d Plenary Council of Baltimore it was recognized as an institution of the Church and placed under the charge of a committee of seven prelates. This committee was dissolved in 1894; and the bureau, as then constituted, was superseded by a new corporation. The chief work of the bureau is the establishment of schools among the Indian tribes, and the obtaining from governmental and other sources of funds for their maintenance.

Catholic Knights of America, a fraternal organization established in Kentucky in 1877. It was chartered in 1880. Its object is to unite fraternally all acceptable Roman Catholics of every profession, business, and occupation; to give all possible moral and material aid in its power to members of the organization, by holding instructive and scientific lectures, by encouraging each other in business, and by assisting each other to obtain employment, and to establish and maintain a benefit fund for the benefit of the families of the members. The benefit fund is distributed according to well-established insurance rules. The age limits for admission are from 18 to 45. At first men only could become members; but since about 1901, women have been allowed admission on the same conditions as men, except the age limits for women are from 18 to 40. The executive power is vested in the Supreme Council (National) with headquarters in St. Louis, Mo.; the State councils, and the officers of the local branches. In 1903 there were 500 branches in the United States, with a membership of 30,000 and a reserve fund of $600,000. Since its organization to 1903, there has been paid to beneficiaries $13,000,000; but the material aid has been slight compared with the spiritual, moral, and intellectual benefit the organization has effected. This is the pioneer Roman Catholic fraternal organization in the United States.

Catholic Majesty, a title given by Pope Alexander VI. to the kings of Spain, in memory of the complete expulsion of the Moors from Spain in 1491 by Ferdinand of Aragon. But even before that time several Spanish kings are said to have borne this title.

Catholic Missionary Union, The, an organization of the Roman Catholic Church established "to procure the services of clergymen and laymen of the Roman Catholic Church to teach and preach as missionaries of their faith in the United States and in furtherance of religious opinion"; "to lease, take, hold, and purchase places, buildings and lands for such teaching and preaching"; to provide for the maintenance of the workers; to publish and distribute books, pamphlets, and other reading matter in connection with these efforts; and to aid archbishops, bishops and other church authorities in the United States to establish and conduct missions within their respective jurisdictions. Its practical activity takes the form of the collection of funds to enable bishops of the various dioceses to reserve diocesan priests for missions to non-Catholics within their various jurisdictions and to maintain such missionaries in their work. The Apostolic Mission House, on the grounds of the Catholic University, Washington, D. C., is the training-school for diocesan missionaries.

Catholic Summer School of America, a school for higher education established by the Roman Catholics at Plattsburg, N. Y., on Lake Champlain. It was organized in 1892, and met at various places before the present site was decided upon. In 1893 the regents of the University of the State of New York granted a charter by which this school became a legal corporation, and was classified in the system of public instruction devoted to university extension. By this charter certain advantages are acquired by summer-school students who wish to prepare for the regents' or State's examinations. The object of the school is to increase facilities for those who wish to pursue lines of study in various departments of knowledge. Opportunities for instruction are provided by lectures from eminent specialists. Courses are given in anthropology, history, literature, ethics, science, and religion. The school is beautifully located, and though not far from the principal summer hotel on Lake Champlain, has its own cottage accommodations, a club or casino for social reunions, its lecture halls, and local book store. The place is an ideal summer resort and attracts many friends of education, both Roman Catholic and Protestant.

Another summer school, the Columbian Catholic Summer School, assembled at Madison, Wis., in July 1898, with lecturers from Washington, D. C., and other centres of educational work. In 1901 it removed to St. Paul, Minn., and adopted the name of the American Catholic Chautauqua.

Catholic Total Abstinence Union of America, a confederation of all the Catholic total abstinence organizations in this country. It believes that the virtue of temperance is a religious virtue, to be cultivated by religious

methods. The membership, amounting in the year 1900 to 80,000, includes women's societies and juvenile organizations, as well as men's societies. While the union urges men to become total abstainers, it does not hold that drink is an evil in itself, or that the use of it is wrong, but that the use of it is for many the proximate occasion of sin; and that by such persons drink should be abandoned altogether. It does not assert that all goodness and virtue are in total abstinence, but it does hold that total abstinence is a powerful preventive of social disorder and sin. The office of the general secretary of the union is in the house of the Paulist Fathers in New York. The union publishes for circulation numerous pamphlets on the subject of total abstinence.

Catholic University of America, an educational institution founded for the purpose of affording an opportunity for pursuing higher studies in the most important branches under the guidance of the Roman Catholic Church. According to its constitutions, the courses of study must be of the highest possible grade; and the constitutions further declare that "the authorities of the university shall take care to confer with the directors of Catholic colleges and seminaries in our country so that all may labor unitedly to advance the education of Catholic youth. The clause in the constitutions concerning the 'higher studies' has been so interpreted that to-day the university is a purely post-graduate institution. Whether the bishops of the United States, who assembled in the second plenary council of Baltimore, contemplated this or not is open to question. It is certain, however, that in October 1866, they earnestly expressed the wish that there should be in the United States a university in which all branches of science, both sacred and profane, should be taught." The precise scope of the university or the time for its foundation were not then decided upon. The idea of a university of the highest class was formulated by the Right Reverend John Spalding, bishop of Peoria, on all appropriate occasions, and the effect of his discourses on public opinion had much to do with the contentment with which American Catholics received the announcement that the prelates of the United States had resolved, in November 1884, in the third plenary council, that a university should be founded. The offer of Miss Gwendoline Caldwell, now the Marquise Monstiers de Merinville, of $300,000 was accepted. This gift was made for the purpose "of founding a grand theological seminary for the higher education of the clergy of the United States, said seminary to form the basis of a future Catholic university."

It was thought that Washington, not because it is the capital of the country, but because of the great educational advantages offered by its libraries, laboratories, etc., would be the logical site, and although other places were suggested, Washington, after mature consideration, was chosen in 1885 by the board of trustees. This decision was formally approved by the hierarchy on 7 Sept. 1887. The Middleton estate, near the Soldiers' Home — one of the most beautiful parts of the District of Columbia — was bought in the same year. In the following year, the Right Reverend John J. Keane, bishop of Richmond, now archbishop of Dubuque, was elected the first rector. In a letter, dated 20 Oct. 1885, the Holy Father, Leo XIII., had warmly approved of the project. Bishop Keane was sent to Rome, bearing all the important documents concerning the university, and, on 21 April it was incorporated under the laws of the District of Columbia. The corner-stone of Caldwell Hall — the school of sacred sciences — was laid on 4 May 1888, in the presence of the President of the United States, representatives of the foreign embassies and legations, and a large group of distinguished persons from all parts of the country. On 13 Nov. 1889, the School of Sacred Sciences — that department of theology and cognate studies for students who had made preparatory studies in the seminaries — was opened with solemn ceremonies. In all the epochs that marked the growth of the university, the interest, sympathy, zeal, and good judgment of its chancellor, Cardinal Gibbons, archbishop of Baltimore, were evident.

So far, while the basis for an ecclesiastical establishment existed, no provision had been made for laymen or for the founding of departments of learning not strictly included in the educational processes of priests. The Catholic hierarchy and the laity were united in desiring that some further provision should be made. the Reverend James McMahon, afterward as Monsignor McMahon, an honorary member of the papal household, a priest of the archdiocese of New York, offered to the university a gift of $400,000. This donation was accepted by the board of trustees in 1891, and the corner-stone of McMahon Hall was laid on 27 April 1892. On 1 Oct. 1895, McMahon Hall was dedicated, and the schools of philosophy and social sciences, including law, were opened. On 24 March 1896, the school of the technological sciences was founded. The directors of the theological school, Caldwell Hall, saw the difficulties which a graduate student in a country where priests are so much in demand for active work would meet. The whole field of theology is so wide, and the time allotted comparatively so short, being two years for the licentiate and two more for the doctorate, that the student is expected to concentrate his work upon one major branch of theology. Minor branches may be taken by him in the school of theology, or one minor in the school of philosophy. The school of sacred sciences is divided into four groups — the biblical, the dogmatic, the moral, the historical. The faculty of philosophy, organized in 1895, contains within it the schools of philosophy, philosophy proper, based on the teaching of St. Thomas Aquinas; experimental psychology, etc.; letters, literature, philology, etc.; physical, biological, and social sciences. The degrees offered in the school of sacred sciences are the baccalaureate, the licentiate, the doctorate — S.T.B., S.T.L., S.T.D. The degrees in philosophy are Ph.M. and Ph.D. The faculty of law contains the school of law and jurisprudence, the school of social sciences having been transferred to the faculty of philosophy on 8 Feb. 1898. Under the board of the institution of technology is the school of the technological sciences.

In September 1896, Bishop Keane, the rector, was called to Rome, to receive later an appointment to the archbishopric of Dubuque. He was succeeded by the Very Reverend Dr. Conaty on 22 Nov. 1896. Having served the allotted term of six years, Bishop Conaty, during his term

titular bishop of Samos, was appointed bishop of Los Angeles, and in April 1903, the Right Reverend Monsignor Dennis J. O'Connell, who in the fall of 1902 had been appointed rector of the university, assumed his duties.

MAURICE FRANCIS EAGAN, LL.D.

Catholic Winter School, a school holding session in the winter months at New Orleans. The first session was held 16 February to 14 March 1896, and was very successful. New Orleans was chosen for its seat as one of the most catholic centres of American education, with Tulane University, the Howard Memorial Library, a fine system of public schools, and the record of French Catholic spiritual and intellectual activity extending through nearly two centuries. At the school popular education is naturally connected with religion; the sessions are opened with pontifical high mass in St. Louis Cathedral.

Catholic Women's Benevolent Legion, a fraternal and beneficial society, incorporated under the laws of the State of New York, 23 Aug. 1895. Age limits, 17 and 55. Branches have been established in nearly every State in the United States; membership, in 1903, 30,000. They have paid out to beneficiaries several thousand dollars, but keep well invested a safe reserve fund. Special efforts have been made to establish social and literary societies, and to promote the spiritual and temporal welfare of their members.

Catholic Young Men's National Union, an association for furtherance of Roman Catholic unity and the moral advancement of its members. The means relied on for accomplishing its object are: practical fulfillment by the individual members of the obligations imposed by their religion; fraternal union of all associations that aim in any way at the spiritual, intellectual, and moral improvement of Catholic young men, and the privilege assured to each member of being received as a guest by any society in the Union, or as a member by transfer. The third plenary council of the Roman Catholic Church of the United States, held at Baltimore, thus expresses approval of the union in its pastoral letter: "In order to acknowledge the great amount of good that the C. Y. M. N. U. has already accomplished . . . we cordially bless their aims and endeavors, and we recommend the union to all Roman Catholic young men."

Catiline (LUCIUS SERGIUS CATILINA), Roman conspirator: b. about 108 B.C.; d. Pistoia 5 Jan. 62 B.C. Of patrician birth, but poor, he attached himself to the cause of Sulla, had some share in his success, and still more in his proscriptions. Murder, rapine, and conflagration were the first deeds and pleasures of his youth. He appears to have served in the army with reputation. Sallust, who has written the history of his conspiracy, describes him as having a constitution that could support hunger, cold, fatigue, and want of sleep, to an incredible extent; with a spirit bold, cunning, fruitful in resources; lusting after the wealth of others, prodigal of his own; a man of fiery passions, but limited judgment. Such was his art, that, while poisoning the minds of the Roman youth, he gained the friendship and esteem of the severe Catullus. Equally well qualified to deceive the good, to intimidate the weak, and to infuse his own boldness into his associates, he evaded two accusations brought against him by Clodius for criminal intercourse with a vestal, and for monstrous extortions, of which he had been guilty while proconsul in Africa. A confederacy having been formed of many young men of high birth and daring character, who saw no other means of extricating themselves from their enormous debts than by obtaining the highest offices of the state, Catiline was placed at their head. This eminence he owed chiefly to his connection with the old soldiers of Sulla, by means of whom he kept in awe the towns near Rome, and even Rome itself. At the same time he numbered among his adherents not only the worst and lowest of the populace, but also many of the patricians and men of consular rank. Everything favored the audacious scheme. Pompey was pursuing the victories which Lucullus had prepared for him; and the latter was but a feeble supporter of the patriots in the senate, who wished him, but in vain, to put himself at their head. Crassus, who had delivered Italy from the gladiators, was now striving after power and riches, and countenanced the growing influence of Catiline as a means of his own aggrandizement. Cæsar, who was laboring to revive the party of Marius, spared Catiline, and perhaps even encouraged him. Only two Romans remained determined to uphold their falling country — Cato and Cicero; the latter of whom alone possessed the qualifications necessary for the task. The conspirators were now planning the elevation of Catiline and one of his accomplices to the consulship, by which they hoped to obtain possession of the public treasures and the property of the citizens under various pretexts, and especially by means of proscription. Cicero had the courage to stand candidate for the consulship: neither insults nor threats, nor even riots and attempts to assassinate him, deterred him from his purpose; and being supported by the rich citizens, he gained his election, 65 B.C. All that the party of Catiline could accomplish was the election of Caius Antonius, one of their accomplices, as colleague of Cicero. This failure, however, did not deprive Catiline of the hope of gaining the consulship the following year. For this purpose he revived the kind of terrorism by which he had laid the foundation of his power. Meanwhile, he had lost some of the most important members of his conspiracy. Antony had been prevailed upon or compelled by Cicero to remain neutral. Cæsar and Crassus had resolved to do the same. Piso had been killed in Spain. Italy, however, was destitute of troops. The veterans of Sulla only waited the signal to take up arms. The signal was now given by Catiline. The centurion Manlius appeared among them, and formed a camp in Etruria. Cicero was on the watch: a fortunate accident disclosed to him the counsels of the conspirators. One of them, Curius, was on intimate terms with a woman of doubtful reputation, Fulvia by name, and had acquainted her with their plans. Through this woman Cicero learned that L. Vargunteius, a senator, and C. Cornelius, a knight, had undertaken to assassinate him at his house. On the day which they had fixed for the execution of their plan, they found the doors barred and guarded. Still Cicero delayed to make public the circumstances of a conspiracy, the progress and resources of which

he wished first to ascertain. He contented himself with warning his fellow citizens, in general terms, of the impending danger. But when the insurrection of Manlius was made known, he obtained from the senate the decree, only promulgated on occasions of the utmost importance, that "the consuls should take care that the republic receive no detriment." It was exceedingly difficult to seize the person of one who had soldiers at his command both in and out of Rome; still more difficult would it be to prove his guilt before judges who were accomplices with him, or at least were willing to make use of his plans to serve their own interest. Cicero had to choose between two evils — a revolution within the city, or a civil war: he preferred the latter. Catiline had the boldness to take his seat in the senate, known as he was to be the enemy of the Roman state. Cicero then rose and delivered that bold oration against him, beginning, *Quousque tandem abutère, Catilina, patientia nostra?* ("How long then, Catiline, wilt thou abuse our patience?") Assuming a confidence he did not possess, he attempted a reply, but his words were instantly drowned by the cries of "Parricide!" and "Traitor!" which rose on all hands. Now fully conscious that his plans were discovered, he rushed from the assembly with threats and curses on his lips, and left Rome at dead of night. The conspirators who remained, Lentulus Sura, Cethegus, and other infamous senators, engaged to head the insurrection in Rome as soon as Catiline appeared at the gates. According to Cicero and Sallust, it was the intention of the conspirators to set the city on fire, and massacre the inhabitants. Lentulus, Cethegus, and the other conspirators, in the meanwhile, were carrying on their criminal plots. They applied to the ambassadors of the Allobroges to transfer the war to the frontiers of Italy itself. These, however, revealed the plot, and their disclosures led to others still more important. The correspondence of the conspirators with their leader was intercepted. As the circumstances of the case did not allow of a minute observance of forms in the proceedings against the conspirators, the laws relating thereto were disregarded, as had been done in former instances of less pressing danger. Cæsar spoke against immediate execution, but Cicero and Cato prevailed. Five of the conspirators were put to death. Caius Antonius was then appointed to march against Catiline, but on the pretext of ill health, gave the command to his lieutenant, Petreius. He succeeded in enclosing Catiline, who, seeing no way of escape, resolved to die sword in hand. His followers imitated his example. The battle was fought with bitter desperation. The insurgents all fell on the spot which their leader had assigned them, and Catiline at their head. See Sallust, 'Bellum Catilinarium'; Cicero, 'Orationes in Catilinam'; Rose, 'History of Catiline's Conspiracy' (1813).

Catinat, Nicholas de, Marshal of France: b. Paris 1637; d. Saint Gratien 1712. He quitted the profession of the law for that of arms, and attracted the notice of Louis XIV. at the storming of Lille in 1667, and was promoted. By a number of splendid deeds he gained the esteem and friendship of the great Condé, particularly by his conduct at the battle of Senef. He was sent as lieutenant-general against the Duke of Savoy, gained the battles of Staffardo, 18 Aug. 1690, and of Marsaglia, 4 Oct. 1693, occupied Savoy and part of Piedmont, and was made marshal in 1693. In the conquered countries his humanity and mildness often led him to spare the vanquished, contrary to the express commands of Louvois. In Flanders he displayed the same activity, and took Ath in 1697. In 1701 he received the command of the army of Italy against Prince Eugene; but was straitened by the orders of his court, and was destitute of money and provisions, while Eugene was allowed to act with full liberty. On 6 July he was defeated at Carpi. Equally unfortunate was the battle of Chiari, where Villeroi had the chief command. It was here, while rallying his troops after an unsuccessful charge, that he replied to an officer who represented to him that death was inevitable in such an encounter. "True, death is before us, but shame behind." In spite of his representations the French court would not believe the disasters in Savoy to be owing to the perfidy of the Duke of Savoy, and Catinat was disgraced. He was a true philosopher, religious without austerity, a courtier without intrigue, disinterested and generous when in favor, and cheerful in disgrace. From his unalterable calmness and consideration his soldiers called him "le Père la Pensée."

Catineau-Laroche, Pierre Marie Sebastien, pē-ār mā-rē sā-bäs-tī-ŏn̄ kā-tē-nō lā-rōsh, French lexicographer: b. Saint-Brieuc 25 March 1772; d. 22 May 1828. He studied at Poitiers, and emigrated to St. Domingo, where he published a journal 'L'ami de la paix et de l'union.' He was sentenced to death for the opinions which he advocated, but, by the timely assistance of the agents of the king of France, succeeded in escaping to Cape Haytien (then called Cape Français), where he alone of 17 of his countrymen was saved from the subsequent massacre in that city. He now visited the United States and England, and on his return to Paris, in 1797, prepared several dictionaries. His printing office having been destroyed by fire, the government employed him in various public capacities. Once more he visited the United States, and on his return, in 1819, he was commissioned to go to Guiana, and study the climate and resources of that province. His notes on that country appeared in 1822.

Catkin. See AMENT.

Cat'lin, George, American traveler and artist: b. Wilkesbarre, Pa., 26 June 1796; d. Jersey City, N. J., 23 Dec. 1872. After practising as a lawyer for two years he set up at Philadelphia as a portrait painter, and in 1832 commenced special studies of the American Indians, residing many years among them both in North and South America. In 1840 he went to Europe, and subsequently introduced three parties of American Indians to European courts. His finely illustrated works are: 'Manners, Customs, and Condition of the North American Indians' (1857); 'North American Portfolio' (1844); 'Eight Years' Travel in Europe' (1848); 'Last Rambles Among the Indians,' etc. (1868). His 500 portraits from life of American Indians are now in the National Museum at Washington, D. C.

Catlin, Henry Guy, American mining engineer: b. Burlington, Vt., 21 July 1843. He studied at the University of Vermont, and

served during the Civil War in the 12th Vermont Volunteers. Besides various contributions to the magazines, descriptive of western life, he has written 'Yellow Pine Basin' (1898).

Catlin, Louise Ensign, American writer: b. Lockport, N. Y., 9 May 1861. She was educated at Smith College, and was married to Frederick Ward Catlin in 1882. She has published 'Marjory and Her Neighbors.'

Catlinite, a dull red indurated clay. It occurs in Pipestone County, Minn., as a layer about 18 inches thick in quartzite. It has been extensively manufactured by the Sioux Indians into pipes and various ornamental objects.

Cat'nip, Cat'nep, or **Cat-mint,** a hardy perennial herb (*Nepeta cataria*) of the natural order *Labiatæ*. It is a native of the Orient and Europe, and has become distributed in most temperate regions of the globe. It is very common in America in the neighborhood of dwellings. Cats are especially fond of it, rubbing themselves upon it and eating it with evident relish. Like other members of its order, it contains a fragrant volatile oil, for which it is sometimes used in cooking. It grows about two feet tall, bears heart-shaped, velvety, whitish-green leaves, and dense whorls of numerous small, purplish or rosy-white flowers. Catnip is sometimes planted in herbaceous borders to soften the tinting, at the same time heightening the effect with its erect stems. In medicine, catnip tea enjoys great popularity with the laity. It is brewed hot and is very useful in attempts to avert "colds." The heat, volatile oil, and accompanying care that the patient takes are all self-conservative.

Cato, Dionysius, the reputed author of the small collection of moral apophthegms known as 'Catonis Disticha de Moribus ad Filium.' Nothing is known of him; but the work, which is apparently in large part a genuine classic, had a high reputation in the Middle Ages.

Cato, Marcus Porcius, THE CENSOR, surnamed PRISCUS, also SAPIENS ("the wise"), and MAJOR ("the elder"), Roman statesman and general: b. Tusculum 234 B.C.; d. 149 B.C. He inherited from his father, a plebeian, a small estate in the territory of the Sabines, which he cultivated with his own hands. He was a youth at the time of Hannibal's invasion of Italy, and served his first campaign, at the age of 17, under Fabius Maximus, when he besieged Capua. Five years after he fought under the same commander at the siege of Tarentum. After the capture of this city he became acquainted with the Pythagorean, Nearchus, who initiated him into the sublime doctrines of his philosophy, with which, in practice, he was already conversant. After the war was ended Cato returned to his farm. As he was versed in the laws, and a fluent speaker, he went at daybreak to the neighboring towns, and acted as counselor and advocate to those who applied to him. Valerius Flaccus, a noble and powerful Roman, who had an estate in the vicinity, observed the talents and virtue of the youth, conceived an affection for him, and persuaded him to remove to Rome, where he promised to assist him with his influence and patronage. A few rich and high-born families then stood at the head of the republic. Cato was poor and unknown; but his eloquence, which some compared to that of Demosthenes, and the integrity and strength of his character, soon drew public attention to him. At the age of 30 he went as military tribune to Sicily. In the following year he was quæstor, at which period there began between him and Scipio a rivalry and hatred which lasted till death. Cato, who had returned to Rome, accused Scipio of extravagance; and, although his rival was acquitted, this zeal in the cause of the public gave Cato a great influence over the people. Five years after, having been already ædile, he was chosen prætor, and obtained the province of Sardinia. His strict moderation, integrity, and love of justice, were here still more strongly displayed than in Rome. On this island he formed an acquaintance with the poet Ennius, of whom he learned Greek, and whom he took with him to Rome on his return. He was made consul 192 B.C., having his friend Valerius Flaccus for colleague. He opposed with all his power the abolition of the Oppian law, passed in the pressing times of the second Punic war, forbidding the Roman women to wear more than half an ounce of gold, to dress in garments of various colors, or to wear other ornaments; but he was obliged to yield to the eloquence of the tribune Valerius, and still more potent female importunities. Soon after, he set out for Spain, which was in a state of rebellion. His first act was to send back to Rome the supplies provided for the army, declaring that the war ought to support the soldiers. He gained several victories with a newly raised army, reduced the province to submission, and returned to Italy, where the honor of a triumph was granted to him. He afterward put himself under the command of the Consul Manius Acilius, to fight against Antiochus, and to carry on the war in Thessaly. By a bold march he made himself master of the Callidromus, one of the highest peaks of the mountain pass of Thermopylæ, and thus decided the issue of the battle. He brought the intelligence of this victory to Rome, 189 B.C. Five years after, in spite of a powerful faction opposed to him, he obtained the most honorable, and at the same time the most feared, of all the magistracies of Rome, the censorship. He had not canvassed for the office, but had only expressed his willingness to fill it. In compliance with his wishes Valerius Flaccus was chosen his colleague, as the only person qualified to assist him in correcting the public disorders, and restoring the ancient purity of morals. He fulfilled this trust with inflexible rigor; and though his measures brought him some obloquy and opposition, they met, in the end, with the highest applause; and when he resigned his office, it was resolved to erect a statue to him with an honorable inscription. He appears to have been quite indifferent to the honor; and when, before this, some one expressed his wonder that no statue had been erected to him, he answered, "I would rather have it asked why no image has been erected to Cato than why one has." Still he was not void of self-complacency. "Is he a Cato, then?" he was accustomed to say, when he would excuse the errors of another. Cato's political life was a continued warfare. He was continually accusing, and was himself accused with animosity, but was always acquitted. His last public commission was an embassy to Carthage to settle the dispute between the Carthagin-

ians and King Massinissa. It is said that this journey was the original cause of the destruction of Carthage; for Cato was so astonished at the rapid recovery of this city from its losses, that he ever after ended every speech of his with the well-known words, *Præterea censeo, Carthaginem esse delendam* ("I am also of opinion that Carthage must be destroyed"). He died a year after his return. Cato, who was so frugal of the public revenues, was not indifferent to riches. He was rigorously severe toward his slaves, and considered them quite in the light of property. He made every exertion to promote and improve agriculture. He was twice married, and had a son by each of his wives. His conduct as a husband and a father was equally exemplary. He composed a multitude of works, of which the only one extant is 'De Re Rustica.' Those of which the loss is most to be regretted are his orations, which Cicero mentions in terms of the highest encomium, and his history of the origin of the Roman people, which is frequently quoted by the old historians.

Ca'to, Marcus Porcius, called (to distinguish him from the censor, his great grandfather) CATO OF UTICA, Roman patriot: b. Rome 95 B.C.; d. Utica, North Africa, 46 B.C. He formed an intimacy with the Stoic Antipater of Tyre, and maintained through life the principles of the Stoic philosophy. His first appearance in public was against the tribunes of the people, who wished to pull down a basilica erected by the censor, Cato, which was in their way. On this occasion he displayed that powerful eloquence which afterward rendered him so formidable, and won the cause. He served his first campaign as a volunteer in the war against Spartacus, and highly distinguished himself. He served as military tribune in Macedonia in 67 B.C. When his term expired he went to Asia, and brought back the Stoic Athenodorus with him to Rome. He was made quæstor in 65 B.C., and executed his difficult trust with the strictest integrity, while he had the spirit to prosecute the public officers for their acts of extortion and violence. His conduct gained him the admiration and love of the Romans, so that, on the last day of his quæstorship, he was escorted to his house by the whole assembly of the people. The fame of his virtue spread far and wide. In the games of Flora the dancing-girls were not allowed to lay aside their garments as long as Cato was present. The troubles of the state did not permit him to remain in seclusion. The example of Sulla in usurping supreme power was followed by many ambitious men, whose mutual dissensions were all that saved the tottering constitution from immediate ruin. Crassus hoped to purchase the sovereignty with his gold; Pompey expected that it would be voluntarily conferred upon him; and Cæsar united himself to both and made use of the wealth of the one and the reputation of the other to attain his own objects. By keeping aloof from all parties Cato served the commonwealth with sagacity and courage; but he often injured the cause which he was trying to benefit by the inflexibility of his character. In 63 B.C. he was chosen tribune of the people. About this time the conspiracy of Catiline broke out. Cato supported Cicero, then consul, with all his power, first gave him publicly the name of "father of his country," and urged, in a fine speech preserved by Sallust, the rigorous punishment of the traitors. He opposed the proposition of Metellus Nepos to recall Pompey from Asia, and give him the command against Catiline, and very nearly lost his life in a riot excited against him on this account by his colleague and Cæsar. After the return of Pompey he frustrated many of his ambitious plans, and first predicted the consequences of his union with Crassus and Cæsar. The triumvirate, in order to remove him to a distance, had him sent to Cyprus, of which he took possession on behalf of Rome (58–57). Compelled to obey, he executed his commission with so much address that he enriched the treasury with a larger sum than had ever been deposited in it by any private man. In the meantime he continued his opposition to the triumvirate. Endeavoring to prevent the passage of the Tribonian law, for investing the triumvirs with extraordinary powers, he was drawn into tumults, and even personal conflict. Being made prætor in 54 B.C., he carried into execution a law against bribery that displeased all parties. After the death of Crassus the civil commotions increased, and Cato, as the only means of preventing greater evils, proposed that Pompey should be made sole consul, contrary to the constitution, which proposition was adopted. The year following, 51 B.C., Cato lost the consulship by refusing to employ bribery to procure a majority. In 49 B.C. the civil war broke out. Cato, then proprætor in Sicily, on the arrival of Curio with three of Cæsar's legions, departed for the camp of Pompey at Dyrrachium. He had always hoped to prevent the war by negotiation; and when it broke out he put on mourning in token of his grief. Pompey, having been victorious at Dyrrachium, left Cato behind to guard the military chest and magazine, while he pushed after his rival. For this reason Cato was not present at the battle of Pharsalia, after which he sailed with his troops to Cyrene, Africa. Here he learned that Pompey's father-in-law, Scipio Metellus, had gone to Juba, king of Mauritania, where Varus had collected a considerable force. Cato immediately set off to join him, and after undergoing every hardship, reached Utica, where the two armies effected a junction, 47 B.C. The soldiers wished him to be their general, but he gave this office to Scipio, and took command in Utica, while Scipio and Labienus marched out against Cæsar. Cato had advised them to protract the war, but they ventured an engagement, in which they were defeated, and Africa submitted to the victor. Cato had at first determined to defend himself to the last, with the senators in the place; but abandoned this plan, and despairing of the commonwealth, and unwilling to live under the despotism of Cæsar, resolved to die. On the evening before the day which he had fixed upon for executing his resolution, he took a tranquil meal, and discussed various philosophical subjects. He then retired to his chamber and read the 'Phædo' of Plato. Anticipating his intentions, his friends had taken away his sword. He sent for it, and in spite of the tears and entreaties of his friends persisted in his purpose, advised those present to submit to Cæsar, and dismissed all but the philosophers Demetrius and Apollonius, whom he asked if they knew any way by which he could continue to live without being false to his principles.

Weeping silently, they left him. He then received his sword joyfully, again read 'Phædo,' made calm inquiries for departing friends, slept awhile, and when left alone stabbed himself. His people rushed in, and finding him in a swoon bound up his wounds; but, on coming to himself, he tore off the bandages and expired. The Uticans buried him honorably, and erected a statue to him. Cæsar, when he heard the news of his death, exclaimed, "I grudge thee thy death, since thou hast grudged me the honor of sparing thy life."

Cato, the title of two noted 18th century plays: (1) A blank verse tragedy by Joseph Addison in five acts. It was first represented in 1713. The scene is laid in a hall of the governor's palace at Utica. The subject is Cato's last desperate struggle against Cæsar, and his determination to die rather than survive his country's freedom. 'Cato' owed its extraordinary success to the deadly hatred that raged between the Whigs and Tories at the time: the Whigs cheered when an actor mentioned the word "liberty"; and the Tories, resenting the implied innuendo, cheered louder than they. To the Whigs Marlborough was a Cato, to the Tories he was a Cæsar. Every poet of the time wrote verses in honor of 'Cato,' the best being Pope's prologue; and it was translated into French, German, and Italian. (2) A tragedy by Metastasio, 1727. The author follows closely the historic accounts of Cato's relations with Cæsar, and the details have more probability than those of Addison. He shows a decided superiority to Addison in making Cæsar the principal figure next to Cato, and placing them constantly in contrast with each other.

Cato Street Conspiracy, or **Thistlewood Conspiracy,** in English history, a plot formed in 1820 to murder the foreign secretary, Lord Castlereagh and other cabinet ministers, and to form a provisional government. The leader of the conspirators was Arthur Thistlewood. The plot was discovered and several of the conspirators captured, on 23 February, when they had assembled in a stable on Cato Street and were preparing to carry out their intentions. Thistlewood, who escaped, was arrested the next day. After a trial in which they were defended by John Adolphus, Thistlewood and four others were executed, and five were transported.

Ca'ton, John Dean, American lawyer and author: b. Monroe, N. Y., 1812; d. 1895. From 1855 to 1864 he was chief justice of Illinois. He published 'A Summer in Norway' (1875); 'The Last of the Illinois and a Sketch of the Pottawatonnies' (1876); 'The Antelope and Deer of America' (1877).

Catop'trics, that branch of optics which explains the properties of incident and reflected light, and particularly that which is reflected from mirrors or polished surfaces. The whole doctrine of catoptrics rests on the principle that the angle of incidence is equal to the angle of reflection and in the same plane.

Catop'tromancy, a species of divination practised by the Greeks, in which a mirror was let down by a cord into a fountain in the temple of Ceres, in Achaia, into which sick persons looked. If the observer's face appeared in it sickly or ghastly the omen was considered unfavorable, and the sick person would not recover; but if, on the other hand, it appeared fresh and healthy, the omen was considered favorable.

Catorce, kä-tōr'thā, or ka-tôr'sā, Mexico, a mining town of San Luis Potosi, which received its name, signifying 14, from a gang of robbers, formerly a constant menace to its inhabitants. It contains valuable silver mines, now pretty well worked out. The ore is mixed with sulphur, and requires treatment by a high degree of heat. When the French invaded Mexico, a mint was started here, and worked until 1867. The amount coined was about $52,000,000. The population is variable, ranging from 10,000 to 18,000, according to the state of mining.

Catostom'idæ, a family of fishes of the order *Plectospondyli* (q.v.), or, in a more limited sense, of the *Eventognathi.* They have the first four vertebræ coalesced and partly converted into a chain of bones reaching from the swim-bladder to the internal ear; the lower pharyngeal bones elongated and falcate, and bearing a row of numerous comb-like teeth; the jaws toothless and formed in part by the maxillary bone; the mouth usually small with thick protractile lips; the form more or less elongate and rounded or slightly compressed; and the fins soft, rayed with no adipose (rayless) dorsal fin. An extensive family of fresh-water fishes, chiefly of North America, where 12 or 14 genera and more than 60 species occur; in addition to which a very few are found in eastern Asia. Although abundant almost everywhere in the United States, none of the species have more than a local value as food fishes. To the *Catostomidæ* belong the suckers, buffalo-fishes, horse-fishes, certain so-called mullets, etc. (qq.v.).

Cat'rail (also known as the PICTS' WORK or PICTS' WORK DITCH), the name applied to the remains of a large earthwork in Scotland, about 50 miles in length, which, beginning at Torwoodlee Hill, near the junction of the Gala Water with the Tweed, runs with a semicircular sweep southward through the counties of Selkirk and Roxburgh to a point under Peel Fell, in the Cheviots. The earthwork consisted of a deep ditch, with a rampart on each side, and varied in breadth from 20 to 26 feet. Various causes have resulted in the destruction of the ramparts in many places. The Catrail has led to much speculation.

Cats, Jacob, yä'kōb käts, Dutch poet: b. Brouwershaven, Zealand, 10 Nov. 1577; d. Zorgvliet, near Scheveningen, 12 Sept. 1660. He studied at Leyden, Orleans, and Paris. In 1627 and 1631 he was ambassador to England, and in 1636 grand pensioner of Holland. His poetry is unimaginative, and didactic, but has been extremely popular with the Dutch middle class by whom he is frequently affectionately alluded to as "Father Cats." His works consist of allegories, according to the taste of his times, poems on the different ages and situations of life, idyls, etc. Among the most noted are 'Het Houwelick' (Marriage) (1625); 'Sinnen Minnebeelden' (1618); 'Trouringh' (1637).

Cat's-eye, the name given to several hard semi-transparent stones used as gems, which, when cut in a certain way, show a line of light giving what is called a *chatoyant* effect. The true cat's-eye is a chrysoberyl of a greenish color, found in Ceylon and Brazil. The line of

light shown when the stone is cut *en cabochon* is due to the structure of the crystal, or to included impurities. The common cat's-eye, of little value, is a crystalline quartz sometimes containing fibres of asbestos, which, cut across the fibres, gives a *chatoyant* effect. It is found in Bavaria. Tiger-eye (q.v.) also shows the chatoyancy of the cat's-eye. Beautiful tourmaline cat's-eyes, rivaling the oriental stones, have recently been found in California. Stones exhibiting the cat's-eye ray have been cut from various other minerals, including beryl, corundum, fibrous hornblende, bronzite, and hypersthene.

Cats'kill, N. Y., village and county-seat of Greene County, 30 miles southeast of Albany, on the west side of the Hudson River and on the West Shore and the Catskill Mountain R.R.'s; also connected with the New York Central by a ferry crossing the Hudson. It is a noted mountain summer resort and has a courthouse, opera house, free academy, two national banks, several public schools, weekly newspapers, manufactories, and hotels. Pop. (1900) 5,484.

Catskill Group, a name given to a great thickness of red, brown, green, and gray conglomerates, sandstones, and shales of which the Catskill Mountains are composed. Being well exposed by numerous cliffs and gorges, these deposits were carefully studied by the New York Geological Survey some 50 years ago. The rocks were believed to constitute a series, having a definite place in the classification of the Palæozoic rocks worked out by the Survey, and were given the name Catskill. Subsequent investigation has shown that the Catskill is not even to be called a group. It is simply a succession of shoal-water deposits of Upper Devonian age, that were laid down along one shore of an interior sea, while normal marine sediments, now represented by limestones, were being laid down elsewhere. Thus it happens that the Lower Catskill, of the Catskill Mountains, is represented elsewhere by limestones of the Hamilton stage, the Middle Catskill by the Portage, and the Upper Catskill by the Chemung. In the Catskill Mountains the so-called Catskill series is 4,500 feet thick; and where thickest, at Mauch Chunk, Pa., it is 7,500 feet thick. Farther south the rocks thin out and disappear altogether in Virginia. Though having no standing as a rock group, the Catskill is of interest from its many resemblances to the Old Red Sandstone of England, made famous by Hugh Miller, and is of economic importance from containing some beds of excellent flags, quarried at numerous openings in Ulster, Greene, and Delaware counties, N. Y., and sold as Hudson River bluestone. See DEVONIAN; OLD RED SANDSTONE.

Catskill Mountains. In the eastern part of the State of New York, facing the valley of the Hudson River, appears a group of mountains so singular in their formation, so exceptional in point of beauty of outline, that they have attracted universal attention since the day when the astonished crew of the Half Moon first saw their peaks rise above the primeval forests that lined the shores of the great river.

That part of the earth's surface now called New York is very old; so old, indeed, that it is difficult to guess at the age of the first rocky islands that appeared above the ancient seas. The Highlands of the Hudson and the plateau of the Adirondacks may be among the oldest lands in the world. The interior of the State remained under the inland sea, that spread from the Hudson valley westward to the present Great Lakes for perhaps millions of years after these primal islands appeared. In time the surf, the rain, and the ice tore down these islands and spread the resulting sand, gravel, and mud far and wide over the sea floor, and in the course of ages filled up this inland sea so that it ultimately became dry land. This fact makes the interior of the State one of the most remarkable places in the world, for here the history of the earth is spread open as a page wherein can be easily read the progress of world-building. Fortunately the floor of the old sea has much of it remained undisturbed so that many successive pages can be seen in their original positions.

Men of science have divided the age of the earth's crust into four great "times," each an unknown number of millions of years long. The first is Eozoic Time, the pale, dim dawn-time before there was any life or before the first faint traces of the lowest life appeared. The second is Palæozoic Time, and this grand period is divided for convenience into three shorter "ages." The third is Mesozoic Time, also divided into three "ages"; and the last, in which we live, is Cenozoic Time. Looking far back to the beginning of the third age of Palæozoic Time we can imagine the southern and western border of the State a vast stretch of sandy bars awash or in the sea, vaster wastes of soft mud and oozy shoals of limey remains of marine life, great pebbly beaches and shingly bays and countless islands in the great muddy sea. The waters swarmed with fish, for the age of fishes was already old, and on the land already appeared the land plants, for the age of land plants was just beginning. To the south were vast tropic, fern-clad swamps that were to be turned later into the coal fields of Pennsylvania. To the north the far older parts of the State were perhaps already dry land or rapidly becoming so. Then, later, we do not know when, this vast track of half sea, half land, slowly turned to sandstones, shales, and slates. Still later, under the tremendous pressure caused by the gradual shrinkage of the earth's crust, it was pushed up into the air, and it now forms the great flat dome or plateau that extends along the southern edge of the State next the Pennsylvania line. Out of this interior upland, that slopes gently to the north, was thrust toward the east a narrow tongue of pale-blue shale or slate-like stone and gray and red sandstones that intruded upon the valley of the Hudson. The disturbance caused by the shrinkage of the earth was far more violent in the eastern part of the State than in the western part, as plainly shown by the present distorted positions of the water-formed rocks in the Hudson valley, and this tongue of newer stone was lifted high in the air. The upward pressure lifted the entire mass into the air perhaps without breaking it and leaving it slightly tilted downward or inclined to the west, a vast, wonderful plateau, a giant-wall of rocks unique among the stony annals of the world. To-day we look upon it in mingled wonder at such a page of world-history and admiration at the handiwork of the rain that has made of such a story-book so great a gal-

BIG INDIAN VALLEY

ENTRANCE TO THE PLAATERSKILL CLOVE.

lery of pictures. We call this open page of the earth's story "the Catskills."

The beauty of every landscape depends upon its port of view. A hill that seems commonplace from one side may have unusual grace and refinement when seen from another side. Herein lies the charm of the Catskills — they are fine from every side. Thrust forward into the comparatively level Hudson valley, they seem to stand quite alone between the Laurentian and far older mountains of the Highlands and the Adirondacks. The traveler approaching by boat or by rail on the eastern shore and from the south is surprised soon after leaving Poughkeepsie by sudden, blue elusive glimpses of dim forms, half cloudlike, upon the northern horizon. Then, for more than an hour, by rail, the mountains pass in grand procession, presenting at every mile new charms of peak and slope. In clear weather and, particularly in winter, the banded or stratified appearance of the eastern face of the range is readily seen, showing plainly that the Catskills are rocks laid down in the ancient sea. Moreover, those mile-long bands mark the ends of the stratifications, sharply broken off and making a remarkable wall or face, unlike the usual slope of other mountains, like the Adirondacks or the Highlands. The views from the West Shore Railroad are equally interesting, and are nearer and more neighborly. The approach from the north, by rail or boat, is also interesting, though it shows the grand panorama of peaks in a reversed order.

There are three routes by which the more settled or summer resort portion of the Catskills may be reached. Beginning at Rondout or Kingston, for the two towns are one, the Ulster & Delaware Railroad enters the Catskills by their southern gateway. Kingston can be reached by the West Shore Railroad or by boat, or by the New York Central Railroad at Rhinebeck and then by ferry to Kingston. On leaving Kingston the first foot hills soon appear, and at every mile the scenery becomes more wild, rough, and interesting. The mountains close in upon the narrow valley up which the road climbs through Stony Clove. This wonderfully beautiful entrance to the uplands of the Catskills is worthy of attention, because the outlines of the mountains on every side plainly show that the once comparatively level and uniform plateau has been carved out by erosion into its present form. It seems clear that these knife-like edges, steep slopes, valleys and peaks were carved out by the rain. They are "weathered" into the shapes they now exhibit. This will be still more evident in other places. After passing the Clove the road enters a comparatively level tableland and ends abruptly and with a grand surprise upon the sheer edge of the once giant table.

Another shorter, and in some respects more sensational, approach is by way of the town of Catskill. This point may be reached by the New York Central Railroad by taking the ferry at Greendale station, or by boat, or by the West Shore Railroad. At this point begins the short and most interesting ride over the Otis Inclined road, which runs west 10 miles from Catskill and, then by means of a cable, climbs directly up the face of the eastern wall. This is one of the most remarkable rides in the world, because the view, as the car ascends, gives at every turn of the wheels a wider and wider view over the Hudson valley and, far away to the east, to the Berkshire Hills. The view from the top is already famous, having been often described, and is worth all the trouble of a long journey to see.

A third route, and the most instructive of all, is from Catskill by road up the Kaaterskill valley or Clove. The first 10 miles to the entrance to the valley is through a rolling, farming country, and should be carefully examined, because the winding road passes over three of the great pages of the earth's story-book. At Catskill, and for the first two or three miles, the road is over very ancient slates, mementos of the old Silurian sea that once covered the State. Chance exposures of these slates show that they have been very much distorted and bent out of their original horizontal positions by the terrific squeezing together caused by the shrinkage of the earth's crust. Leaving these slates we pass over ridges of younger limestones and then still younger slates and sandstones, and wherever exposed to view along the road all appear to be tilted up or having a slight slope to the west. All the time there are glimpses of the higher and far younger rocks of the Catskills, till at last the great banded gray wall rears itself before us as if to bar the way. Then follows the four-mile ride up the steep, winding road that leads to Haines Falls and the mountain top.

The most striking things about this wonderful valley road are the views it gives of the stony skeleton of the mountains. At the very gateway of the Clove we can see a sheer wall of the rock from its smooth water-worn base in the brawling brook up to the topmost shelves of rock that seem ready to fall into the deep valley below. Here is the open page of the Catskill story. We can see the bands of rock laid down through the ages. Some are hard and, resisting the weather, stand out in overhanging sheets. Others are softer and are hollowed out, and appear to be crumbling into thin, slaty fragments. Nowhere in the eastern part of the State can be seen a more remarkable exhibit of stratified rocks showing every change of the seasons and years through which these muds, sands, and gravels were laid down in the old sea. Added to this historic interest of the ride is the wonderful and ever-increasing beauty of the mountains, the woods and stream. The green walls of forest close in on every side, and at each turn of the road new beauties of slope and crag appear, till the journey ends at the very point of the grand cañon as we cross the bridge above the roaring falls, and are in the uplands of the Catskill plateau. From the residence park at the head of the cañon are magnificent views down the narrow valley and out over the wide sunny valley of the Hudson 2,000 feet below.

The Catskills have no commercial value. They are unfit for farming purposes, and are clothed with forests, once very valuable, but now ruined by the too greedy lumbermen, and of only slight present value. The whole range is a comparatively useless wilderness. The rocks themselves have some value, for the mountains are one vast storehouse of bluestone. A wilderness, it is true, but a great and precious heritage for all the people. The Catskills make one of New York's greatest assets, for they are at once a summer home, a sanitarium, and vast

people's camping and forest park. It is something that so magnificent a prospect as that from the top of the eastern wall is in easy reach of the city of New York. It is something that so much of beauty of mountain and valley are in sight of a dozen towns, and in sight of the thousands passing up and down the Hudson valley. A wilderness, perhaps, but a precious wilderness to be forever preserved for the delight and instruction of the people of this country.

The chief impression left upon the mind of the visitor at the Catskills is wonder that a once great and probably level plateau should be carved into such sharp peaks and cañon-like valleys. Could the rain have carved out the rocks to these forms? The rain and the frost, aided by the peculiar slaty character of the rock, undoubtedly did in the long centuries carve the great plateau into its present mountain-like form. Part of the rock is comparatively soft, all of it is full of fissures and readily splits apart under the expansion of ice formed in its fissures. It is quite possible that all of it was once softer and more plastic than now, and the process of tearing down by ice and floods may have been more rapid than at present. However this may be, it is clear that the Catskills are the true children of the rain, whose soft persuasive fingers carved the plateau into its present beautiful mountains and spread the broken wastage far and wide over the country below. In this work of the weather we have also to recognize that the glaciers of the Ice Age may and probably did largely help in the work of modeling the mountains. The great heaps of glacial rubbish at the lower entrance of the Stony Clove valleys would indicate that a vast amount of rock was removed during the time when the plateau was covered with ice. The floods that followed the melting of the ice also helped in the work of carving the peaks and cañons that we so much admire to-day. CHARLES BARNARD.

Catt, Carrie Lane Chapman, American suffrage reformer: b. Ripon, Wis. She was educated at the State Industrial College of Iowa and subsequently studied law. She was for three years principal of the High School at Mason City, Iowa, and in 1884 was married to Leo Chapman, editor of the Mason City *Republican,* who died some two years later. Since 1890 she has devoted herself to woman suffrage work, lecturing frequently in behalf of the movement, and as chairman of the National Organization Committee doing very much to place the reform on a substantial basis. She has been associated in recent years with nearly all of the important gains which have been made in this direction, and the carrying of several state amendments relating to equal suffrage has been attributed to her influence. In 1891 she was married to G. W. Catt (q.v.). She was elected president of the National American Woman Suffrage Association in 1903.

Catt, George William, American civil engineer: b. Davenport, Iowa, 9 March 1860. He was educated at the Iowa State College and subsequently studied engineering and law. He was chief engineer of the San Francisco Bridge Company, 1887–92; president and engineer of the New York Dredging Company, 1893–9; and president and engineer of the Atlantic Gulf & Pacific Company from 1899. He has built government dry docks at the navy yards at League Island, Philadelphia, and Mare Island, California.

Cattaro, kät'tä rō, Austria, a seaport in Dalmatia, at the foot of the Gulf of Cattaro, on the east side of the Adriatic, 38 miles southeast of Ragusa. It lies at the foot of steep limestone rocks, strongly fortified and surmounted by a castle, and is surrounded with walls. The buildings are in the Venetian style, and the streets are narrow, irregular, and dark. It is the seat of a Roman Catholic bishop, and the cathedral is a well-built edifice. The harbor is spacious, but there is not much trade. Pop. (1903) about 6,000.

Cat'tegat, a gulf of the North Sea, between North Jutland to the west, Sweden to the east, and the Danish islands of Zealand, Funen, etc., to the south; about 150 miles from north to south, and its greatest breadth about 90. It is difficult of navigation, being not only shallow toward the shores, and irregular in depth, but obstructed by several sand-banks, and the adverse winds which often prevail here increase the danger. The Cattegat is noted for its herring-fishery. It contains the islands Samsöe, Anholt, Lessöe, and Hertzholm.

Cattell, James McKeen, American psychologist: b. Easton, Pa., 25 May 1860. He graduated at Lafayette College in 1880, and studied at Leipsic, Paris, Geneva, and Göttingen. He was assistant under Wundt at the University of Leipsic, professor of pyschology in the University of Pennsylvania in 1888–91, and became professor of experimental psychology in Columbia University in 1891. He is co-editor of the 'Psychological Review' and 'Science.'

Cattell, William Cassidy, American educator: b. Salem, N. J., 30 Aug. 1827; d. Philadelphia, Pa., 11 Feb. 1898. He was graduated at Princeton in 1848, and at Princeton Theological Seminary in 1852. He was professor of Latin and Greek in Lafayette College, 1855–60, and president of that institution, 1863–83, and subsequently prominent in the Presbyterian Church.

Cat'termole, George, English water-color painter: b. Dickleburgh, near Diss, Norfolk, 8 Aug. 1800; d. Clapham, Surrey, 24 July 1868. Like Turner and William Hunt, he started in life as a topographical draughtsman, and was employed as a draughtsman on Britton's 'English Cathedrals' when only 16. He drew the designs for the illustrations of various annuals, the Waverly Novels, for an edition of Shakespeare, and for his brother's 'History of the Civil Wars.' In 1833 he was elected a member of the Society of Painters in Water-colors. He was a member also of the Academy at Amsterdam, and of the Belgian Society of Water-color Painters. He obtained a medal of the first class at the Paris Exhibition of 1855. In 1851 he resigned his membership of the English Society, and devoted himself to oil-painting. Among the best known of his pictures are 'Hamilton of Bothwellhaugh about to Shoot the Regent Murray'; 'Luther at the Diet of Spires'; 'The Armorer's Tale'; 'A Terrible Secret,' etc.

Catti, kat'tī, one of the most renowned and valiant of ancient German tribes, inhabiting what is now Hesse, also part of Franconia and Westphalia. They carried on bloody wars with the Hermunduri and Cherusci. In the time of Cæsar they dwelt on the Lahn, and

"ROUNDING UP" CATTLE ON A GREAT WESTERN RANCH.

opposed him with effect. Drusus defeated without reducing them. In the reign of Marcus Aurelius they made incursions into Germany and Thrace, but were afterward defeated by Didius Julianus. In 392 they made their last appearance in history in union with the Franks. According to Cæsar, their territory was divided into 100 districts, each of which was obliged to send annually 1,000 men into the field, whose place was supplied the following year by those who had before remained at home to cultivate the ground. Their food was milk, cheese, and game; their dress the skins of animals. Their limited princes, who governed in connection with a diet, annually distributed the lands among the families.

Cattle, a term of rather indefinite use, but usually referring to domestic animals of the bovine family, more specifically termed oxen. The various domestic races will be found treated under BUFFALO, DAIRYING, DOMESTIC ANIMALS, and OX; wild oxen under AUROCHS, BISON, BUFFALO, URUS, etc.

Cattle Feeding. See NUTRITION OF FARM ANIMALS.

Cattle-plague, any plague by which large numbers of cattle are destroyed. Such plagues have existed at intervals, more or less, in all countries and in all ages. Among the severer visitations in centuries preceding the 19th may be mentioned a great plague which arose in Hungary in 1711, whence it spread to other countries, destroying in the next three years about 1,500,000 head of cattle. A second visitation, which affected England and the west of Europe between 1745 and 1756, caused the death of 3,000,000 cattle. See RINDERPEST.

Several of the diseases of cattle are due to insects, including that called "pleuro-pneumonia" or "Texas cattle fever," which is caused by a blood-inhabiting sporozoon that is carried by ticks from an infected animal to a healthy one, communicating the disease. Cattle bred in the southern States have become practically immune, but the disease affects and kills northern cattle. The natural limit of the tick concerned (*Boophilus annulatus*) nearly coincides with Mason & Dixon's line, and federal laws prohibit the shipping north of any cattle from south of this line, except between 15 November and 15 February. Other species of this same genus of ticks transmit similar cattle diseases in various parts of the world, especially the "blue tick" (*B. decoloratus*) of South Africa. The remedy is to dip the cattle in vats of cotton-seed oil or some similar mixture. See CATTLE-TICK.

The appellation "cattle-plague" is also loosely given to another disease among cattle in the United States, which is otherwise known as "lumpy-jaw," a most virulent and incurable affection. Experiments have been time and again ineffectually tried to find a cure for this, though large governmental encouragement has been offered. A rigid examination of cattle is made by government inspectors at all receiving and shipping ports.

Cattle-tick, or **Texas-fever Tick,** an arachnid (*Boophilus annulatus*) related to the mites, and prevalent in the western and southwestern States. It is a reddish, coriaceous, flattened, or swollen creature from a quarter to half an inch in length. The cattle-tick lays a great many eggs, nearly oval, dark-brown, coated with a hard secretion, the process of egg-laying lasting for several days or a week. The young tick, on hatching, is whitish, afterward turning brown; it has three pairs of legs. After molting it becomes a nymph, when the fourth pair of legs is added. During the nymph stage the reproductive organs develop. After another molt it becomes sexually mature. It completes its development from the larva to the adult on cattle. After this second molt the couple pair, and the male grows but little. The female, voraciously feeding on the blood of her host, grows to a gigantic size, her body swelling and becoming gorged with blood and eggs. The males can be easily detected by their smaller size, and by the extension of the shield over the entire back. Ticks live upon the blood of their host. The females, as they increase in size, store away quantities of the ingested food in an immense convoluted chamber or appendage of the stomach. In summer only three or four days after the final molt are necessary for the ticks to become large. When fully gorged, and the eggs have become fertilized, the female loosens her hold in the skin of her host, and falls to the ground, where she lays her eggs, after which her body contracts, shrivels up, and then dies. The young ticks get access to cattle by climbing bushes, whence they reach out and attach themselves to passing animals.

It has been proved that ticks, by sucking the blood of cattle infested with the Texas fever germ, which is a sporozoon (*Apiosoma bigeminum*), may communicate the disease (bovine malaria) to healthy cattle, just as the sporozoan blood-parasite of yellow fever, or of malaria, is communicated by a mosquito (*Anopheles*). In dealing with ticks it should be remembered that it breathes by spiracles, or minute holes in the sides of the body. By the use of oil, or any greasy substance, those openings may be covered, thus asphyxiating the creature. The ticks may thus be killed by dipping or spraying the cattle with cotton-seed oil. Cattle should be kept away from wooded or bushy pastures.

There are one or two forms very closely allied to the Texas cattle-tick, and named *Boophilus australis;* they are regarded by experts as either distinct varieties or species from *B. annulatus.* They transmit the cattle-fever in the countries above named. Another sub-species or variety, the blue tick (*B. decoloratus*) in South Africa transmits the same disease in that region.

The Lone Star tick (*Amblyomma unipuncta*) is, next to the cattle-tick, to be held responsible for the transmission of the Texas fever. It may be recognized by the simple bright silver spot on the back.

Consult Curtice, 'The Cattle-Tick' ('Journal of Comparative Medicine and Veterinary Archives' 1891–2); Salmon and Stiles, 'Cattle-Ticks of the United States' ('17th Annual Report of the Bureau of Animal Industry,' Washington, 1902).

Catty, a standard of weight in China and the Malayan Archipelago. In China, the Straits Settlements, Java, British North Borneo, etc., it is approximately one and a third pounds. The Siamese catty is equal to 2.675 pounds.

Catubanganes, kâ-too-bän gans', or **Catabangenes,** warlike tribes settled in the mountains of Guinayangan, in the province of Tayábas (Luzon). Through lack of available information nothing can be said about their race affiliations, whether they be pure Malay or Negrito-Malay. They are probably Remontados mixed with Negrito blood and gone wild.

Catubig, kä-too-bĭg', Philippines, a small town in the island of Samar, 48 miles north of Catbolagan. The place is garrisoned by United States troops, who, in June 1900 withstood an attack by 600 insurgents. This episode was a stirring incident of the war. Pop. 9,565.

Catul'lus, Valerius (whose prænomen is stated by some to be Caius, by others Quintus), Roman poet: b. Verona 86 B.C.; d. after 47 B.C. He went in his youth to Rome, where his accomplishments soon won him the favor of those who adorned that splendid era. He was the friend of Cicero, of Plancus, Cinna, and Cornelius Nepos; to the last he subsequently dedicated the collection of his poems. This collection is not of great extent, but shows what he was capable of doing in several kinds of poetry, had he preferred a steady course of study to pleasure and traveling. Probably a part of his poems have not come down to us. Of the merit of his productions there has been but one opinion among the ancients as well as moderns. Tibullus and Ovid eulogize him; and Martial, in one of his epigrams, grants to him alone a superiority over himself. In sportive composition and in epigrams, when he keeps within the proper limits of that species of poetry, he is a model. He succeeded also in heroic verse, as in his beautiful episode of Ariadne, which appears to have inspired the poet who afterward sung of Dido. He was the first of the Romans who successfully imitated the Greek lyric poetry. The four odes of his that remain to us make us feel a lively regret for the loss of the others. A weighty objection, however, against most of his writings, is their licentiousness and indelicacy. The common opinion is that he died 57 B.C., in the 30th year of his age, but this is no doubt erroneous, as there are allusions in his own works which prove him to have been alive in the consulship of Vatinius, as late as 47 B.C. Scaliger maintains, but without sufficient proof, that he died in his 71st year. An excellent English translation of Catullus in the original metres is that of Robinson Ellis, who has also published an admirable annotated edition of the Latin text (1878).

Cat'ulus, Quintus Lutatius, Roman general, historian, and poet: b. about 152 B.C.; d. 87 B.C. He was consul in 102 B.C. with Gaius Marius, and in the following year was proconsul. During his proconsulship he, with Marius, defeated the Cimbri near Vercellæ, the modern Vercelli, in northern Italy. As one of the aristocratic party and a partisan of Sulla, he was proscribed by Marius. With the exception of two epigrams nothing of his work has survived.

Caub, kowb, Prussia, a town in the province of Hesse-Nassau, on the Rhine, 30 miles west-northwest of Wiesbaden. Here Blücher crossed the Rhine with his army, 1 Jan. 1814, and here, too, till 1866, toll was levied by the Duke of Nassau — the only ruler who kept up this feudal privilege — from vessels navigating the Rhine. Caub has slate quarries, and opposite, on an island in the river, where Louis le Débonnaire died in 840, is a castle called the Pfalz, built in 1326, which is said to have been resorted to for safety by the Countess Palatine. In 1876 and 1879 Caub was the scene of two serious landslips.

Cauca, kow'kä, Colombia, one of the nine departments of the Republic, bounded on the northwest by Panamá; on the north by the Caribbean Sea; on the east by the departments of Bolivar, Antioquia, Tolima, and Cundinamarca, and the Republics of Venezuela and Brazil; on the south by Brazil and Ecuador; on the west by the Pacific Ocean. The territory of Caquetá and the districts of Huila, Inzá, and Páez are included in this department. The eastern part of Cauca is watered by the Amazon and some of the affluents of that river; the Guaviare and the Casiquiare flow into the Orinoco; the Atrato empties into the Gulf of Urabá; while a dozen smaller rivers flow into the Pacific. On both the Caribbean and Pacific coasts there are several ports. For area, population, etc., see COLOMBIA.

Cauca, a river in Colombia, South America, an important tributary of the Magdalena; length, 600 to 700 miles. Its course is mainly northerly, and it forms many waterfalls. It gives its name to the largest department of Colombia.

Caucasian (kô-kā'shan) **Race,** a term introduced into ethnology by Blumenbach, in whose classification of mankind it was applied to one of the five great races into which all the different nations of the world were divided. Blumenbach believed this to be the original race from which the others were derived, and he gave it the epithet of Caucasian because he believed that its most typical form — which was also that of man in his highest physical perfection — was to be met with among the mountaineers of the Caucasus. The physical superiority of these people is scarcely maintained at the present day, but the name is still retained in classifications. The Caucasian race comprises the most highly civilized nations of the world, including most of the inhabitants of Europe (the Turks, Hungarians, and Fins being excluded); the Hindus, Persians, Arabs, Hebrews, and the ancient Phœnicians of Asia; and a large proportion of the inhabitants of northern Africa. See ETHNOLOGY.

Caucasus Mountains, a lofty and rugged range of mountains forming one of the natural barriers between Europe and Asia. It extends in a northwest and southeast direction from near the strait of Kerch on the Black Sea to near Baku on the Aspheron peninsula projecting into the Caspian Sea. The distance between these points in a straight line is 700 miles, but following the main ridge of the mountains about 940 miles. The range varies in width from 30 to 130 miles, and may be divided into three parts. The western portion, extending from the Strait of Kerch and the Sea of Azov to the peak of Elbruz, consists of a series of parallel ridges of stratified rocks, the ridges apparently formed by huge, tilted fault blocks. The northern slopes of the northern ridges rise rather gently out of the plain of Caucasia; the southern slopes, along the fault

planes, are abrupt; and the southern slope of the main ridge has in places almost vertical walls 2,000 to 3,000 feet high. There are few passes through this great barrier, and these are difficult. The snow line is at about 9,000 feet.

The highest peaks of the Caucasus are in the central part, from Elbruz to the Adai-Khokh. Here, as to the westward, is a series of parallel ridges, the higher summits all snow-clad, with deep longitudinal valleys; but some of the highest peaks, Elbruz and Kazbek, are on spurs more or less isolated from the main range. In this central portion of the Caucasus, as yet but incompletely mapped, there are said to be fully 20 summits higher than Mont Blanc, the highest peaks being Elbruz, 18,470 feet; Dykh-tau, 17,054 feet; Koshtantau, 16,881 feet; Jang-hitau, 16,564 feet; and Kazbek, 16,546 feet. The snow line is at about 11,500 feet, and the total number of glaciers of the first class is fully 175, while rounded rock surfaces and boulders in the valleys show that glaciation was much more extensive at no very distant time. East of Kazbek the range narrows and is narrowest south of Vladikarkaz, where it is crossed by the Russian military road to Georgia. This road runs over the Kobi Pass and through the great Davial gorge, one of the greatest mountain chasms in the world. The eastern part of the Caucasus, from Kazbek to the Caspian, is of much more complicated structure; the range widening and including a high plateau crossed by subordinate ranges having an east-northeast and west-southwest direction, though what may be termed the main axis continues its southeast course.

The plains of Caucasia north of the mountains are underlaid by Tertiary and Quaternary strata. The foot hills of the western Caucasus and the plateau of the eastern Caucasus show rocks of Cretaceous and Jurassic age, and nearer the main axis of the range are Palæozoic formations. The main axis shows schists and gneisses with granite and syenite. Trachyte and similar rocks occur, and some of the peaks, Kazbek, are probably in part of volcanic origin.

The scenery of the Caucasus is wild and gloomy rather than beautiful. The lower slopes are thickly wooded, but there is not the combination of dark forests, beautiful lakes and graceful snow-crowned summits that makes some ranges — for instance the Selkirks in British Columbia — so attractive to the mountain-climber.

The mineral wealth of the Caucasus is very great; in fact, in this respect the range is one of the most noteworthy in the world, but owing in part to the very rugged topography much of this wealth is still undeveloped. Among the valuable resources may be named the coal fields near Ochemchiri and at Kuban and Kutais, the copper mines of Tiflis and Elizabethpol, and the silver ores of Terek and Kutais. More important are the manganese mines near Kutais, whence some 500,000 tons of ore were exported in 1900 to various European countries and the United States. Most important of all are the oil wells of the Aspheron peninsula, the most remarkable in the world, whence some $12,000,000 worth of petroleum, benzine, etc., were shipped to foreign countries in 1900. Consult: Bodenstedt, 'The People of the Caucasus'; Deniker, 'Races of Man'; Keane, 'Man, Past and Present'; Ripley, 'Races of Europe.'

Cauchy, Augustin Louis, ô-güs-tăn loo-ē kō-shē, French mathematician: b. Paris 21 Aug. 1789; d. there 23 May 1857. He published in 1815 a 'Treatise on the Theory of Waves,' which was afterward made the basis of the undulatory theory of light. Between 1820 and 1830 he wrote several important treatises, and at Prague, where he resided as tutor to the Comte de Chambord, he published his 'Treatise on the Dispersion of Light' (1837). From 1848 to 1852 he was professor of astronomy at Paris, but refused the oath of allegiance to Napoleon III., and lived in retirement till his death. See 'Life,' by Valson (1868).

Caucus (short for "caucus club"), a political party gathering for nominations or conference on party policy, as distinguished from a merely hortatory one. It may be a town or ward meeting, to nominate local candidates or delegates to higher nominating conventions (the latter sort are also called "primaries"); or a party conference of members of Congress or a legislature, to decide on members or confirmations to office. Originally, a secret gathering on the model of the Caucus Club of Boston, whose leading business was the making of "slates" for local offices, and incidentally came to be the molding of a policy of local autonomy in opposition to British influence. The etymology of the name is pure guesswork. The usual derivation from "caulkers" (sc. club), or an imaginary "caulk-house," is most improbable. More plausible would be that from Lat. *caucus*, Gr. *kaukos*, a cup, as originally a convivial society, most secret societies of that day having classical names or initials; the words, however, are not classical, but mediæval, and so are less likely to have come under their notice. Possibly, though not probably, it is mere alliterative comic jargon. Most probable of all is the adoption of an Algonkin word, *kaw-kaw-wus*, to consult: — if the word is real: cf. "pow-wow." At all events, the club and the elements of the system originated in Boston during the 18th century. Samuel Adams' father was accredited as a founder and eminent master of the art, in which his son became immortal, and to which he owed his first election to the legislature. The preparation and distribution of ballots before the election was one of its chief instrumentalities. The first mention of the original club is in John Adams' diary, February 1763: he says the town officers are "regularly chosen there before they are chosen in the town," and intimates that the distribution of business favors as a *quid pro quo* was not absent, which might be assumed.

The system rapidly grew; indeed, in some form it is part of the inevitable machinery of majority rule, which in constitutional countries has supplanted the primitive decision of battle by merely counting the opposing hosts, it being assumed as a basis that the larger could outfight the smaller. But for common action of that majority there must be some method of determining its will before the elections, as to both measures and men; and all countries with any measure of popular control have some shaping and testing mechanism of the sort. In England it has been formally established since 1880, by the so-called "Birmingham system"; but in the higher lines of policy, even before that, the two great political clubs of London, the Carlton and the Reform, Conservative and Liberal, discharged much of the functions of

H. 4

informal caucuses. Nevertheless, the power of the caucus is greatly affected by local and national circumstances. In England and most continental countries, it is restrained, by the still powerful aristocratic system, which forms a counterpoise and provides natural leaders; in France, by the centralized government system. In no other country has it the same authoritative power as in the United States. Early in our history it became universal. Said Adams in 1814: "We have Congressional caucuses, State caucuses, county caucuses, city caucuses, district caucuses, town caucuses, parish caucuses, and Sunday-school caucuses at the church doors." This is primarily due to the entire legal equality of all classes; that absence of prescriptive privileges furnishing a shelter for minorities and independent action, which is considered the chief glory or the chief danger of democracy, according to the point of view. The gradations of the American political system into national, State, district, and municipal powers have produced a corresponding hierarchy of caucuses, each sending delegates to the next higher caucus or convention, and constituting a "machine" of great efficiency and formidableness.

But it has been made at once practically irresistible, and largely worthless for its ostensible purpose of determining the general sentiment of the party, by the "spoils system," which throws the organization and management of the caucuses into the hands of those who can give their whole time to political work, because paid for this service (in reality though not in name) out of the public treasury. Thus managed, the caucus in the larger places does not necessarily represent the views of the majority, and very often the leading object is to prevent the majority from meddling with the machine. In theory, the caucus being a voluntary association of the members of a voluntary association, to deliberate as to its policy and agents, all are fairly bound by its decisions, and have no right to "bolt" afterward; otherwise there is an end of all common action. It is of course to the interest of the managers to cultivate this theory, and the military similes of "campaigns" and "forces" and "deserters" and "closing up ranks," etc., and to stigmatize all individual courses as equivalent to treachery and insubordination; and no matter how spurious this technical majority may be, or by what methods a real minority may have attained a seeming vote of confidence, a "regular" nomination will always have enormous weight. In part, it is true, this is because the vast majority have no common wish or purpose, and are destitute of constructive political ideas; and any pronouncement of the constituted party authorities is really their will, which is simply to obtain such a mandate. Hence, "regularity" is the test of merit; and this willingness to accord to the show what belongs to the substance is the almost invincible bulwark of political corruption.

This has generated in the last few years a host of efforts, public and private, to break down the monopoly of the caucus and substitute a real and direct control of nominations by the party; control of policy cannot thus be shifted, but corruption is the work of men, not of measures. It cannot be said that any of these movements as yet are very successful or promising, largely owing to the consideration just mentioned, that the initial possession of political ideas is a condition precedent to expressing them. One scheme is to have nominations made by direct popular vote instead of by primaries; but this simply shifts the function of the caucus one stage back, to decide on the votes for nomination instead of the votes for offices. More elaborate, and in some directions more efficient, are the legislative provisions made in several States for taking the primary caucuses themselves under the control of the law, as elections have always been. In this case, all persons who wish to vote in a party caucus must register themselves as members of that party. The effects of this measure have been a singular mixture of good and evil, and probably reflect in this regard the motives of the enactment. On one hand, faction leaders can no longer swamp a caucus with a rabble of purchased voters from the lowest element of the other party. In theory a check list was always used; but as it had no legal validity, it was scouted whenever a majority, real or spurious, was interested in evading it. The check list under the law cannot be so treated. On the other hand, an obvious effect of the law, probably not absent from the minds of the framers, is to extinguish as a party force the independent or "mugwump" element of both parties, who try to reform their own party by a leverage obtained from the other; and are therefore excluded from either, as they cannot keep changing registration. If this was a motive, the Nemesis has been speedy. The party managers in various places are greatly disappointed and alarmed to find that only a fraction even of their normal and calculable voting strength will register at all, and therefore they are nominating in the dark, without knowing what the party sentiment is. When they honestly wish to ascertain the party feeling, they have great difficulty in doing it. The dislike to sporting a registered, public, and unchangeable party label is not confined to the more intellectual independents, but is strong in the general mass; and the attendance at primaries is a much less sure guide than of old to what the party will support at the polls. The precise future of the caucus cannot be forecast; but there is little evidence thus far of a loosening of its hold.

Congressional Caucuses for President and Vice-President.— These grew out of the Electoral system (see ELECTORAL COLLEGE), and perished, significantly, at the same time that the old theories of an educated official class and professional trained office-holders gave place to the inrush of the untrained democracy and rotation in office. It is no mere coincidence that the last Congressional caucus was held to nominate a candidate in the last election that returned a President of the old school. The masses were taking everything into their own hands; Jackson and popular nominations came in together, though there was one intermediate link when the people acted through the State legislatures. The theory of the Electoral system was that the electors, themselves the chosen sages of the people, should make free choice of the best men in the country for the chief executive offices; but from the first their choice was pointed out in advance. While Washington lived and would take office, no other candidate for President was possible; and for his first Vice-President, John Adams was the choice of New England,

and the other States had either their "favorite sons" or no special wish. In 1792 the same circumstances controlled; though New York's favorite, George Clinton, won the support of several southern States. The electors deferred to the notorious public feeling; but their action was nominally independent. In 1796 this was still true of the Federalists, who made a combination of North and South on Adams and Pinckney; it was substantially true of the Republicans, for Jefferson was the undisputed leader, and while the Republican members of Congress informally agreed to support Burr, there was no set ticket for the electors to support at party peril. But in 1800 both parties held regular but secret caucuses, and adopted tickets which the electors voted solidly and even stupidly, with results still memorable. The Federalists voted that Adams and Pinckney should be supported alike. The point of this was that up to that date, there was no distinct candidate for President and Vice-President, the one who received the largest electoral vote being President and the next one Vice-President. Adams was certain to receive no Republican votes; but if all the northern Federalists voted for Pinckney, he as a popular Southerner would probably receive some stray votes from that section, and so be elected President over Adams, whom the Federalists hated but did not wish to bolt. Thus they would defeat him by appearing to keep strict party faith. The Republicans on their part held a caucus, and made a similar agreement with regard to Jefferson and Burr; not with similar designs, but to placate New York, which complained that her candidates were "knifed" in the South. Of course in both cases, if the whole electoral body voted "straight," there would be a tie and no election. This actually happened in the case of Jefferson and Burr, and the struggle was only settled after 36 votes. The results were the adoption of the Twelfth Amendment to the Constitution, regulating presidential elections and compelling electors to state which candidate was to have which office; the implacable hostility of Jefferson to Burr, which killed the chance of the latter to rise further in his party, drove him into the arms of the Federalists, and ultimately ended in the murder of Hamilton; and as the presidential electors had simply voted the tickets dictated by the party representation in Congress, they instantly became as they have ever since remained, nullities. The second occasion was on 29 Feb. 1804, when the Republicans (in open, not secret caucus) renominated Jefferson; they dropped Burr for George Clinton (New York still keeping the place), by 67 votes to 20 for Hugh H. Breckinridge of Pennsylvania, and some scattering. The Federalists held no ostensible caucus; but as they were scheming to support Burr for governor of New York, and with that prestige nominate him for President, the plan must obviously have been agreed on in what served the purpose of caucuses. Burr's killing of Hamilton spoiled this scheme, however: they nominated Pinckney and King, and were almost annihilated. The third caucus was on 23 Jan. 1808, also by the Republicans; but only two thirds of the party members attended, as the conclusion was foregone. Madison and Clinton were nominated. Meantime the Virginia legislature had split into Madison and Clinton factions, the former much the stronger; nominated separate sets of electors and carried the quarrel into Congress, where Monroe's party issued a manifesto protesting against both Madison and Congressional caucuses. The Federalists held none, and renominated their previous candidates. On 18 May 1812 the Republican or Democratic party held its fourth caucus, and renominated Madison on his express agreement to declare war against Great Britain; also nominating Elbridge Gerry for Vice-President. This time they appointed a national committee to see that the nomination was respected. The New York Democrats, however, were very restive under the "Virginia dynasty" and the "secretary of state dynasty"; and their members of the legislature held a caucus, nominated George Clinton, and protested against the Congressional caucus as always nominating a Virginia candidate. A secret caucus or convention of Federalists was held in New York in September, adopted the Clinton nomination, and nominated Jared Ingersoll for Vice-President. On 29 March 1816 the Democrats, now practically the only existent party, held the last caucus which accomplished anything. Henry Clay and another member introduced resolutions that the caucus nominations be abolished, but were voted down; and Monroe was nominated, by no great margin over Wm. H. Crawford of Georgia. Daniel D. Tompkins of New York was nominated for Vice-President. In 1820 a caucus was summoned, but only about 50 members responded, and they took no action. The general feeling was now strong against the system, as there was but one party, and a nomination by Congressional caucus was equivalent to allowing Congress to appoint the President and Vice-President. In 1824 several State legislatures passed resolutions forbidding the State representation in Congress to attend a caucus if one were called. But the Crawford party, who wished to give his nomination the prestige of a national verdict, held one at which about a fourth of the members attended, and nominated him and Albert Gallatin. It can hardly have gained him much support, however, and a paralytic stroke finished whatever chance he might have had. In the next (1828) campaign, the State legislatures made the nominations; and in 1832 the nominating convention was introduced. See UNITED STATES — BEGINNINGS OF PARTY ORGANIZATION.

Cauda-galli Grit, or **Esopus Shale,** one of the basement members of the Devonian System in New York and New Jersey. The name ("cock's tail") is from a characteristic fossil, supposed to be a seaweed.

Caudex, in botany, the stem of a tree, more especially the scaly trunk of palms and tree-ferns. It often appears as a rhizome running along the surface of the earth or underground.

Cau'dine Forks, a pass of southern Italy, in the form of two lofty fork-shaped defiles, in the Apennines (now called the valley of Arpaia), into which a Roman army was enticed by the Samnites, 321 B.C., and being hemmed in was forced to surrender.

Cau'dle's Curtain Lectures, Mrs., a series of humorous sketches by Douglas Jerrold (q.v.).

Cauer, Emil, ā'mēl kow'ėr, German sculptor: b. Dresden 29 Nov. 1800; d. Kreuznach 4 Aug. 1867. He studied at Berlin under Rauch and at Munich under Haller; in 1825 he went to Bonn where he was instructor in art at the university; in 1832 he was appointed drawing master at the gymnasium at Kreuznach. Among his best works are 'Sickingen'; 'Charles V.'; 'Melanchthon'; and the representations of Red Ridinghood and other fairy tale characters. He also restored the antiques in the museum at Dresden.

Cauer, Karl, German sculptor: b. Bonn 14 Feb. 1828; d. Kreuznach 17 April 1885. He studied with his father, Emil Cauer (q.v.), and with Wolff in Berlin; he also visited London several times in order to study the Parthenon friezes. Among his works are the Schiller monument at Mannheim, 'The Witch' and a number of portrait busts. In his later life he became interested in the question of coloring sculptures, and made a number of experiments in that line.

Caughnawa'ga, kô-nā-wā'gą, Canada, a town in the province of Quebec, situated on the St. Lawrence River, near the Lachine Rapids, opposite Lachine. It is an Indian town, and was established by the Jesuit missionaries in 1676 as a colony for the Indians who were converted to Christianity. The converts were Iroquois, mostly Mohawks, and remained loyal to the French during their quarrels with other Indians and the English. In the Canadian insurrection of 1838 Caughnawága was the first place to be attacked by the rebels, who were repulsed by the Indians and a number of them taken prisoners. Pop. 2,000.

Caul, a membrane enclosing the viscera, such as the peritoneum or part of it, or the pericardium; also the amnotic membrane that surrounds all fœtal structures and sometimes becomes caught by the head of a child at birth. Many superstitions have been connected in the past with cauls. The child that happened to be born with one was esteemed particularly fortunate; and the possession of it afterward, however obtained, was highly prized, as of a charm of great virtue. The superstition is thought to have come from the East. With the French, *etre né coiffeé* was an ancient proverb, indicative of the good fortune of the individual. The alchemists ascribed magical virtues to it; and, according to Grose, the health of the person born with it could, in after life, be judged of by its condition, whether dry and crisp, or relaxed and flaccid. Medicinal virtues were imputed to it by the ignorant, as well as the property of preserving the owner of it from drowning. It has been bought and sold occasionally at a high price, sailors having been known to give as much as $150 for a single caul.

Caulaincourt, kō-lăń-koor, **Armand** (ärmäń) **Augustin Louis de,** Duke of Vicenza, French statesman: b. Caulaincourt (Aisne), 9 Dec. 1772; d. Paris 19 Feb. 1827. He early distinguished himself as an officer, was made a general of division in 1805, and shortly after created Duke of Vicenza. Faithful to the last to Napoleon, he was made Minister for Foreign Affairs in 1813, and during the Hundred Days resumed the office, receiving a peerage of France, of which he was deprived after the Restoration.

Cauliflower, a member (*Brassica oleracea,* var. *botrytis*) of the cabbage tribe, derived from the same original species as cabbage (q.v.), from which it differs in having a more or less compact head of metamorphosed flowers and adjacent parts instead of a bud-like head of densely packed leaves. Broccoli is a late hardy form of cauliflower not widely grown in America. Cauliflower is more delicately flavored than cabbage, like which it may be cultivated and prepared for the table. In its cultivation, however, it seems to be more difficult to bring to perfection unless conditions, especially moisture and temperature, are just right. The essentials of its cultivation are highly fertile soil well drained, but well supplied with moisture, a moist climate or season, and shelter from the direct rays of the sun, as on a northern slope, or reduction of the intensity of the sun's heat by planting either very early so as to mature in spring, or late so as to mature after mid-autumn. The heads produced in midsummer are generally inferior in both size and quality. When the heads begin to develop, the leaves are tied above them so as to keep out foreign materials, but mainly to make the heads whiter and more attractive to the purchaser. In preparing for the table the finer heads are usually served with a cream sauce; the poorer ones being pickled. In comparison with cabbage seed, the seed of cauliflower is very expensive because of the difficulty of maintaining its high quality. Formerly the seed was imported from Denmark and Germany, but Washington and British Columbia have been gaining in the market with their cauliflower, cabbage, and other related seeds.

Cauliflower suffers from the same enemies that attack cabbage. Consult: Bailey, 'Cyclopedia of American Horticulture'; Allen, 'Cabbages, Cauliflowers, etc.'

Caulking, Calking, or **Cauking,** the act of rendering the seams of a ship water-tight by driving oakum, cotton, or the like, between the planks in the ship's decks or sides, in order to prevent the entrance of water. After the oakum is driven hard into the seams it is covered with hot melted pitch, to keep the water from rotting it.

Caulop'teris, a genus of fossil tree-ferns found in the coal-measures.

Caura, kow'ra, a river of Venezuela, rises among the sierras of the frontier, and flows north-northwest to the Orinoco. On both sides stretches the territory of Caura (22,485 square miles), with immense forests of valuable woods.

Caus, or **Caulx, Salomon de,** French engineer: b. Dieppe 1576; d. Paris 6 June 1626. He was in the service of the Prince of Wales in 1612, and of the Elector Palatine, at Heidelberg, 1614–20, but by 1623 returned to France, and became engineer and architect to the king. At Frankfort, in 1615, appeared his 'Causes of Kinetic Energy,' a work in which is described an apparatus for forcing up water by a steam fountain, differing only in one detail from that of Della Porta. There is no reason to suppose that the apparatus ever was constructed, but on the strength of the description, Arago has claimed for De Caus the invention of the steam-engine.

Cause, that which brings about any change in the state, condition, circumstances, etc., of things; that which produces an effect.

In philosophy, that by which something known as the effect is produced, and without which it could not have existed. To give a satisfactory notion of all the senses in which this word has been used it would be necessary to review all the teachings of metaphysics from the time of Aristotle downward. The various positions of the conflicting philosophers can here be only very briefly indicated. Aristotle states causes to be of four kinds: efficient, formal, material, and final. The efficient is the force or agency by which a result or effect is produced; the formal the means or instrument by which it is produced; the material, the substance from which it is produced; the final, the purpose or end for which it is produced. A scientific cause demands the recognition of all the essential conditions, any one of which being absent the effect could not take place. Locke finds the origin of the notion of cause in sensation. Assuming that bodies have the property of modifying each other, it is only necessary to observe them to perceive and be driven to admit the principle of causality. Hume declares the power which we attribute to one object over another to be a chimera; such a power does not exist, or if it does we can have no idea of it. What we call cause and effect is merely two phenomena always following in the same order, and which we have fallen into the habit of associating in our minds in such a way that on perceiving the first we inevitably expect the second. According to Leibnitz there is no existence, however humble, but is a force, that is, a real cause. The notion of force is the base even of the notion of existence; all that which is has a certain virtuality, a certain causative power. The human soul, like all the other limited forces in this world, is but a monad isolated in itself, but yet in whose inner being the whole creation is reflected, and whose movements have been from the beginning co-ordained by Divine Wisdom with the harmonious movement of the universe. Kant's doctrine is that the notion of cause and the principle of causality certainly exist in our minds; but they are only simple forms of our understanding, or the entirely subjective conditions of thought. We are compelled by a law or a form pre-existing in our intellect to dispose all the objects our imagination represents, or all the phenomena our experience can discover, according to the relation of cause and effect; but we do not know if anything really exists, independent from our intellect, which resembles a cause, a force, or effective power. Against the doctrines of the intuitionalists it has been urged that the mere statement that the mind possesses a belief in causation proves nothing: some men believe in it, others do not, and unanimity is necessary to the establishment of a universal belief. Nay, more, the mere universality of a belief is no conclusive proof of its correctness, as put in the words of the late John Stuart Mill—"A mere disposition to believe, even if supposed instinctive, is no guarantee for the truth of the thing believed. If, indeed, the belief amounted to an irresistible necessity, there would be no use in appealing from it, because there would be no possibility of altering it. But even then the truth of the belief would not follow: it would only follow that mankind were under a permanent necessity of believing what might possibly not be true; just as they were under a temporary necessity, — quite as irresistible while it lasted — of believing that the heavens moved and the earth stood still. The things which it has been supposed that nobody could help believing are innumerable, but no two generations would give the same catalogue of them." The theological question of a First Cause is debated on the ground that matter of itself is inert, that spirit is active, that in order of existence one spirit or active force must be the first and uncaused cause.

In law, a cause is a right of suit or action; it is something for which suit may be brought by someone against another; it includes the right of action. In practice, a cause of action comes into existence when there is such a state of facts or circumstances as will enable a person or party having certain relations with particular persons or property to commence a suit. Cause includes the right, but right may not include a cause; as a person may have a right of action which is barred by lapse of time, and as soon as the time expires the cause ceases.

Causeries du Lundi, kōz-rē dù lĕn-dē, a famous series of literary criticisms by Sainte-Beuve. Every prominent name in French literature, from Villehardouin and Joinville to Baudelaire and Halévy, is here exhaustively discussed. Sainte-Beuve widened the scope of criticism by inventing what has been called "biographical criticism." He endeavors to explain the work by the character of the author, his early training, his health, his idiosyncrasies, and above all, by his environment. The 'Causeries' were first published as feuilletons in the papers. They may be divided into two distinct classes: those written before, and those written after, the Restoration. In the former there is more fondness for polemics than pure literary purpose; but they represent the most brilliant period in Sainte-Beuve's literary career. After the Restoration, his method changes; there are no polemics; however little sympathy the critic may have with the works of such writers as De Maistre, Lamartine, or Béranger, he analyzes their lives solely for the purpose of finding the source of their ideas.

Caustic, in medicine, any agent that causes a destruction of the parts. Caustics act by withdrawing water from the skin, by coagulation of the albumen or by other chemical change. Thus caustic soda and caustic potash act by the abstraction of water. They further act on fats, saponifying them, and are particularly serviceable as caustics if penetration is desirable. Sulphuric acid acts in much the same way, but it is very difficult to control its caustic action. Others of the acids are used as caustics, nitric, glacial acetic, tri-chlor-acetic, etc. Many mineral salts, silver nitrate, zinc sulphate, zinc chloride, copper sulphate, arsenic, etc., are valuable caustics. The most reliable caustic is the actual cautery, using a dull red flame. Caustics are used to stimulate the growth of granulating wounds, to remove warts, condylomata, etc., to cleanse ulcers, remove cancerous growths, to prevent poisoning by dog-bites, etc. See ESCHAROTICS.

In mathematics, the curve to which rays of light are tangent after reflection from a surface or refraction by a lens. Opticians endeavor so to shape their mirrors and lenses as to make the

caustic two intersecting straight lines. When this is achieved, the "spherical aberration" disappears. Caustic curves may often be seen on the bottom of a cup, produced by reflection from the curved wall of the cup. See also LIGHT.

Cauterets, kō-tē-rā, a watering-place in the department of Hautes-Pyrénées, France, 3,250 feet above sea-level, in the valley of the Laverdan, 42 miles south-southeast of Pau. The stationary population of the place is only about 1,300, but it is annually swelled in summer by some 20,000 visitors, for whose accommodation numerous sumptuous hotels and bathing-establishments have been built. It is a good centre and guide-station for ascents among the Pyrenees. The sulphurous springs, 25 in number, and varying in temperature from 60° to 131° F., are the most abundant in the Pyrenees (330,000 gallons per day), and have been known from Roman times; though their modern reputation dates from the 16th century, when Margaret, sister of Francis I., held her literary court and wrote much of her 'Heptameron' at Cauterets.

Cautery. See CAUSTIC; ESCHAROTICS.

Cautin, kow'tēn, Chile, a province divided into the departments of Temuco and Imperial. It has an area of 3,127 square miles, and a population of 100,000. The city of Temuco (pop. 9,000) is the capital. Principal towns are: Nueva Imperial (3,000), Lautaro (3,500), and the port of Carahue (2,000). There is a regular line of steamers between Carahue and Valparaiso. In the province are numerous lakes, one of which, Villarica, with a surface of 100 square miles, lies at the base of a volcano of the same name. The Central Railway connects the capital with other cities of the republic. The soil of the province is fertile. Wheat and lumber are produced. The urban property is valued at $7,600,000, and the rural at $16,000,000.

Cautin, kow'tēn, a river in Chile; flows west through a province named after it, and empties into the Pacific Ocean. Its length is about 200 miles.

Cautionary, a term used in Scotch law and signifying the "promise or contract of one, not for himself, but for another." A simple cautioner is one who binds himself conjointly with the debtor or principal for the greater security of the creditor. The creditor may proceed against the principal debtor and cautioner, or against either of them. The cautioner may, however, stipulate on the document constituting the cautionary obligation that the creditor shall take legal measures against the debtor or principal. Cautioners are frequently taken bound, conjunctly and severally, or as full debtors, with the principal, in which case both parties are liable for the whole debt. It follows, from the nature of the obligation, that a cautioner who has paid the debt has an action against the principal for relief. All cautionary obligations must be in writing, and have the signature of the cautioner attached; the conditions of contract must be clearly stated, which must be strictly observed, otherwise the cautioner is freed.

Cautionary Towns, four towns in Holland, Briel, Flushing, Rammekens, and Walcheren, so named because they were given to Queen Elizabeth in 1585 as security for their repaying her for assistance in their struggle with Spain. They were restored to the Dutch Republic by James I. in 1616, although only a portion of the sum advanced was refunded.

Cauvery, kô'vėr ĭ, **Cavery,** or **Káveri,** a river of Hindustan, to the waters of which Mysore and the Carnatic owe much of their agricultural wealth. It rises from several head streams in Coorg and Mysore, near the coast of Malabar, flows southeast through Mysore and the Madras Presidency, and after a winding course of about 470 miles falls into the Bay of Bengal by numerous mouths, the largest being the Coleroon. Where it separates Mysore from Coimbatore the Cavery forms an island called Sivasamudram, near which are two magnificent cataracts, each about 200 feet high, and more or less broken into cascades according to the volume of water. In connection with this river and its tributaries important canals and dams have been constructed for purposes of irrigation, with the effect of rendering the country on either side highly productive. The Cavery is filled by the monsoon rains in May and July, but is not navigable except by small boats.

Cava, kä'vä, Italy, a city in the southern province of Salerno, situated in the valley of Fenestra, three miles northwest of Salerno. It is the seat of a bishop, suffragan to the Pope, and contains a cathedral, three other churches, a convent, a house of refuge, a hospital, and a seminary. Silk, cotton, and linen are manufactured here, and in the numerous small villages that surround the town. The district is extremely unproductive, but the inhabitants have become wealthy by their industry and commerce. About one mile from Cava is the magnificent Benedictine convent of the Trinity, which formerly contained an excellent library, now transferred to Naples. This convent is now national property, and contains a lyceum and boarding-school. Pop. 10,000.

Cavaignac, Jacques Marie Eugène Godefroy, zhäk mä-rē ė-zhăn gō-dŭ-frwä kä-vān-yăk, French politician, son of Louis Eugène Cavaignac (q.v.): b. 22 May 1853. He studied at the Lycée Charlemagne, Lycée Louis le Grand, École Polytechnique, and École des Ponts et Chaussées, interrupting his studies long enough to serve in the Franco-Prussian war. In 1882 he was elected to the Chamber of Deputies, and in 1885 was appointed Under-Secretary of State. In the Panama revelations of 1892 he bore a conspicuous part. On the organization of the Bourgeois cabinet, 30 Oct. 1895, he was appointed Minister of War. In August 1898, he added to the excitement over the Dreyfus prosecution by forcing Lieut.-Col. Henry to confess to a forgery of certain letters bearing on the Dreyfus case, and the accused officer committed suicide within a few hours. In the following month Cavaignac resigned his office. He is author of 'The State and Tariffs of Railroads' (1883); and 'Formation of Contemporary Prussia' (1891).

Cavaignac, Jean Baptiste, zhŏn bäp tēst, French revolutionist: b. Gourdon 1762; d. Brussels 24 March 1829. He became an advocate at the Parliament of Toulouse; and in the National Convention acted as deputy from the department of Haute-Garonne. He rose to be one of the leaders of the Mountain (Extreme Republicans), and, on his various dictatorial missions to

the armies of the Republic, displayed the greatest energy, tact, and incorruptibility. He was a member of the Council of Five Hundred; and afterward became a Councilor of State in Murat's kingdom of Naples. During the Hundred Days he acted as prefect of the Somme. He was banished as a regicide, at the second restoration.

Cavaignac, Louis Eugène, loo-ē ė-zhān, French general: b. Paris 15 Oct. 1802; d. 28 Oct. 1857. His father, Jean Baptiste Cavaignac (q.v.), was a furious revolutionist, and member of the Council of Five Hundred. Young Cavaignac entered the École Polytechnique in 1820, and afterward the military school at Metz, and in 1824 joined the 2d regiment of engineers. He served in the campaign in the Morea, and in 1829 was appointed captain. Being at Arras on the outbreak of the revolution of 1830 he was the first officer in his regiment to declare for the new order of things. In 1832 he was sent to Africa, where he remained for several years, and greatly distinguished himself in defending the French settlement against the Arabs and by his judicious organization of military hospitals, barracks, and works of defense. In 1844 he received the appointment of brigadier-general, with the government of the province of Oran in Algeria.

Cavaignac was in Africa when the revolution of February 1848 took place. In March of that year he was created by the provisional government general of division and governor of Algeria. Shortly afterward the office of minister of war was offered to him, but declined. On 23 April he was chosen representative of the department of Lot in the National Assembly, and proceeding to Paris to take his seat arrived there on 17 May. The capital was then in a state of great excitement from an attempt on the assembly by the Red Republicans two days before. Cavaignac was offered again the portfolio of the minister of war, and this time accepted it. The measures which he adopted to guard against the crisis which was evidently approaching were prompt and decisive. In a few days an army of nearly 30,000 men was assembled in and around Paris, and this precaution was speedily justified by the events which followed. On 23 June, at 11 o'clock A.M., the terrible Communist insurrection burst forth, and for three days Paris presented the most dreadful scene of tumult and bloodshed which had been witnessed there since the massacre of St. Bartholomew. About 15,000 persons perished, and property was destroyed to the value of upward of $1,000,000. By the energy of General Cavaignac, aided by the loyalty of the army and the national guard, the insurrection was suppressed on 26 June. On that day the National Assembly delegated the entire executive power to Cavaignac as dictator, who resigned it again into its hands on the 29th, and received it anew on the same day, with an acknowledgment by the legislative body of the services rendered by him to his country. Notwithstanding these he was defeated in the elections for the presidency in the month of December following, and Louis Napoleon was preferred to the office. On 20 December he resigned his dictatorship. After the *coup d'état* of 2 Dec. 1851, he was arrested and conveyed to the fortress of Ham, but was liberated after about a month's detention. In 1852 and in 1857 he was elected member for Paris of the legislative body, but on both occasions was incapacitated from taking his seat by refusing to take the oath of allegiance to the emperor. The last years of his life were spent at his country-seat in the department of Sarthe. See Montfort, 'Biographie du Général Cavaignac' (1848); Deschamps, 'Life' (1870).

Cavaillé'-Coll, Aristide, ä-rīs-tēd kä-vä-yä-kŏl, French organ builder: b. Montpellier 2 Feb. 1811; d. Paris 13 Oct. 1899. He built the organs in the Parisian churches of St. Sulpice, the Madeleine, etc., and invented the pressure method for sounding tones of different depths and heights.

Cavaillon, kä-vä-yôṅ (ancient CABELLIO), France, a town in the department of Vaucluse, 14 miles southeast of Avignon, on the right bank of the Durance. It is an ancient place, and has a cathedral built between the 10th and 12th centuries. The surrounding district is one vast garden, producing excellent fruit, especially melons and peaches. A considerable trade is carried on in silk, olive-oil, fruit, early vegetables, and wool. The industries comprise straw hats, edge-tools, tanning, currying, the preserving of fruits and vegetables, etc. The Romans had an important colony here, and erected many edifices, of which almost the only remains are some tombs and the fragment of a triumphal arch. It was an episcopal city as early as the 5th century. Pop. 6,000.

Cavalcanti, Guido, gwē dō kä-väl-kän'tē, poet: b. probably in Florence about 1252; d. there 28 or 29 Aug. 1300. He was the friend of Dante, and like him a zealous Ghibelline. When the dissensions of the Guelfs and Ghibellines disturbed the public peace of Florence the citizens banished the chiefs of both parties. The Ghibellines were exiled to Sarzana. On account of the unhealthy air of that place they were permitted to return; but Cavalcanti had contracted a disease of which he died at Florence. In his youth he made a pilgrimage to St. Jago de Compostella in Galicia. Returning home through France he fell in love at Toulouse with a young lady of the name of Mandetta. To her most of his verses which we possess are addressed. They are remarkable, considering the period at which they were written, for their beautiful style. His 'Canzone d'Amore' have gained him the most fame. The learned Cardinal Egidio Colonna and some others have made commentaries on it. His 'Rime,' published by Cicciaporci, appeared at Florence in 1813. See Ercole, 'Guido Cavalcanti e le sue Rime' (1885).

Cavalcaselle, Giovanni Battista, jō vän nē bät tēs'tä kä-väl-kä-sĕl'lā, Italian historian: b. Legnano 22 Jan. 1820; d. Rome November 1897. He became the literary associate of J. A. Crowe (q.v.), with whom he produced the epoch-making 'History of Painting in Italy' (1864–71), the most complete work on the subject; 'Early Flemish Painters' (1857–72); 'Life of Titian' (1877); 'Raphael' (1883).

Cavalier, Jean, zhŏṅ kä-väl-yā, French soldier, chief leader of the Camisards in the wars of the Cevennes: b. Ribaute, near Anduze, 1681; d. Chelsea, England, 17 May 1740. He was at Geneva when the severe measures of Louis XIV. against the fanatical Camisards induced him to return home. Several insurrec-

tions had already broken out, but he soon so distinguished himself by his courage and success, that, though only at the age of 24, he became the acknowledged head of the insurgents. Notwithstanding their gallantry they were obliged to carry on the war on such unequal terms that the impossibility of success became apparent, and Cavalier entered into a capitulation with Marshal Villars, by which he obtained a pension of 1,200 livres, a colonel's commission, and permission to raise a regiment of his own for the king's service. He was summoned, however, to Versailles, and, finding himself looked upon with suspicion, made his escape and soon after visited England. In the Spanish war, being supported by the English and Dutch, he commanded a regiment raised by himself and partly consisting of refugee Camisards, and distinguished himself greatly at the battle of Almanza in 1707, where he was severely wounded. He was afterward pensioned by the British government, appointed governor of Jersey, and made a major-general.

Cavalier, (1) a horse-soldier; an armed horseman; a knight; the name given to the supporters of King Charles I., during the Great Civil war in England, from their gay dress and demeanor, as contrasted with the austerity of the parliamentary party, who were styled Roundheads, from the mode in which the more puritanical of that body wore their hair closely cropped. (2) In fortifications, a kind of interior bastion, several feet more elevated than the principal bastion of the fortress in which it is formed. The use of the cavalier is two-fold: It serves either to defilade the works from the fire of an enemy on an adjacent height, or to command the trenches of the besiegers. Cavaliers are sometimes constructed in the gorges, or on the middle of the curtain, and their form is the semicircular; but when they are within the bastion they are now built with straight faces and flanks parallel to those of the work in which they are placed. French cavaliers are works raised by besiegers on the glacis of a fortress, for the purpose of enabling them to direct a fire of musketry into the covered way.

Cavaliere Servente, kä-vä-lē-ār'ē sėr-vĕn'-tā. See CICISBEO.

Cavalieri, Emilio del, ā-mēl'ē-ō dĕl kä-väl-yā'rē, Italian musician: b. about 1550; d. Florence 1599. He was a Roman nobleman and a pioneer in musical composition, having probably written the first oratorio and the first work akin to the modern opera. His compositions were: 'Soul and Body'; 'Philena's Despair'; etc.

Cavalieri, or **Cavalleri, Francesco Bonaventura,** frän-chĕs'kō bo"nā vän too'rā, Italian mathematician: b. Milan 1598; d. Bologna 3 Dec. 1647. He studied mathematics at Pisa under B. Castelli, a disciple of Galileo, officiated as professor in Bologna, and was author of several mathematical works, the most prominent of which was entitled 'Geometria Indivisibilium continuorum nova quadam ratione promota.' Having expressed in this work some original ideas concerning the abstruse sciences, the Italians claim him to be the inventor of the infinitesimal calculus.

Caval'la. See KINGFISH.

Cavalli, Pietro Francesco, pē-ā'trō frän-chĕs'kō kä-väl'lē, Italian composer: b. Crema about 1600; d. Venice 14 Jan. 1676. He began to write operas in 1637, and continued to produce them for 32 years. Among his works are: 'Xerxes'; 'Jason'; and 'Hercules in Love.' He is now believed to be the inventor of the 'Da Capo,' which was generally attributed to Scarlatti.

Cavallini, Pietro, pē ā'trō kä-väl-lē'nē, Roman painter: fl. in the latter part of the 13th and in the early part of the 14th century. He was the disciple of Giotto, and the first painter of the Roman school who was worthy of competing with the great Florentine masters. His most celebrated work, a picture of the 'Crucifixion,' is at Assisi. Most of his other works are now destroyed.

Cavallo, kä väl'lō, **Tiberius,** Italian physicist and inventor: b. Naples March 1749; d. London December 1809. He early removed to England, where he published, in 1775, a notice of 'Extraordinary Electricity Observed at Islington.' He invented several ingenious instruments for electrical and chemical experiments. His apparatus for measuring the force and quantity of electricity is remarkably delicate and accurate. In 1779 he was admitted to the Royal Society. His study of the influence of air and light on plant-development was brilliantly original, and paved the way for valuable discoveries in organic life. He wrote: 'Medical Electricity' (1780); 'A Treatise on the Nature and Properties of Air, etc.' (1781); 'Complete Treatise on Electricity' (1786); 'Treatise on Magnetism in Theory and Practice' (1787); 'Elements of Natural and Experimental Philosophy' (1803); and other scientific works.

Caval'ly, one of the popular names of *Caranx hippos,* called also horse-crevallé and jack. It is a large and well-known food fish, which occurs abundantly on both coasts of North America, as far south as Cape Cod and the Gulf of California, and also in the East Indies. It belongs to the family *Carangidæ* (q.v.), and is distinguished by having an enlarged tooth on each side of the tip of the lower jaw, and by having the breast naked.

Cavalotti, Felice, fā-lē'chā kä-väl-ōt'tē, Italian statesman and poet: b. Milan 6 Nov. 1842; d. Rome 6 March 1898. He fought under Garibaldi and gained celebrity; was a political journalist. Elected to the Italian parliament (1868), he opposed Crispi and became an extreme Republican. He fought 32 duels, in the last of which he was killed. The most noted of his tragedies are: 'Agnes de Gonzaga'; and 'Alcibiades' (1874). He also published volumes of lyric verse, his best work being 'The Canticle of Canticles.'

Cavalry. Ancient history records many marvelous statements concerning the operations of cavalry. The numbers attributed to the columns of Ghengis Khan and other celebrated raiders seem quite incredible to the modern military student whose ideas are naturally directed to the serious questions of transport and supply. Subsisting mainly upon a species of flour prepared from goat's milk, dried, the idea of a modern commissariat train was not within the range of the wildest dreams of the Tartar hordes, which for centuries roamed over an immense area of Asia and even Europe. Cavalry was used for many centuries before the

UNITED STATES CAVALRY EXERCISES.

Christian era and proved its value in many historic campaigns. Alexander the Great developed his cavalry to a considerable degree of excellence and used it in large bodies with marked success. The Romans made effective use of cavalry, but depended almost entirely upon auxiliaries for recruiting that important branch of their armies. Saddles had not come into use during all this early period of military history and all cavalry then existing must of necessity be classed as light or irregular.

During the Middle Ages, military power was quite generally dependent upon the good will of and exercised through the nobility or chiefs of clans. The use of heavy armor, battle axes, and powerful two-handed swords, demanded strong saddles and large horses. The feudal system was gradually developed and spread over Europe and the British Isles. The fighting was done by the knights and esquires, mounted, while the peasant retainers armed with pikes and crossbows, constituted groups of footmen, who frequently operated in campaigns of considerable duration, but were not armies in the modern sense of the term.

The invention of gunpowder was responsible for a revolution in military methods, and the changes were particularly noticeable in the mounted contingents. The long-continued efforts to make mounted infantry and dragoons efficient while the state of firearms was yet quite primitive, resulted only in discrediting the horsemen. The value of armor was much decreased through the introduction of gunpowder, but its use in some forms continues even in this utilitarian age and generation. The lance has been periodically lauded and discredited. At various times in the world's history it has won high praise through great performance on the field of battle. It has been restored, recently, to full favor in some of the most highly trained and effective armies of modern times, yet no serious test by armies has been made of it since the days of Napoleon. A few charges here and there during a century do not constitute a service test of any weapon. The influence of improvements in weapons is generally seen in modifications of tactics and drill regulations. From this cause may be traced the modification in the orders of battle, which, in various periods of history have required that cavalry should engage in formations ranging from one to six or more ranks in depth. The Americans abandoned the double-rank formation for cavalry as a result of the experience of the Civil War, when nearly 300,000 mounted men, exclusive of mounted infantry, were in the opposing armies. The history of cavalry and its gradual evolution from the hordes of barbarian horsemen of ancient times, down to the modern regiments of lancers or dragoons, covers a vast field which cannot be sketched in a brief essay. The development of the American type of cavalry during the past half century is an interesting and profitable study because of the position now occupied by the United States in the world's affairs.

Until the reorganization of the United States Army in 1901 the proportion of the various arms was always determined through the expediency of the moment rather than upon any well-considered general plan. During the Revolutionary struggle, the early Indian wars, the War of 1812, and, in fact, until the discouragement of constant failure in 1833 to 1836 demanded a change of policy, the mounted service of the army was almost wholly performed by militia or volunteers. The absence of a properly organized contingent of cavalry during the Revolution enabled the young and energetic Tarleton to ride with his small force of dragoons almost at will through the southern Colonies. All the early Indian wars were treated as spasmodic outbreaks demanding temporary application of force, but requiring no provision for the future. The War of 1812 contained much discouragement, but its history records several marked incidents to prove the value of trained troops and the urgent need in a Republic of an organized body to keep alive a knowledge of military art and improvements applicable to warfare. The experience was ignored, however, and it was not until 1821 that a reorganization of the army was undertaken and then the cavalry was left out entirely. During the Black Hawk war a battalion of mounted rangers was called into service and was merged the following year (1833) into the new regiment of mounted troops, the First Dragoons, which constituted the first permanent cavalry regiment of the United States Army. The Second Dragoons was organized in 1836 especially for service in the Seminole war and the valuable services rendered, together with the increasing needs of protection for the Southwestern frontier prevented the disbandment of this fine regiment. These two regiments of dragoons constituted the entire mounted force of a permanent character in service prior to the Mexican war. During this war the regiment of Mounted Rifles was organized and, although it fought as infantry for a time, it was reorganized as a mounted regiment at the close of the war and has continued in service since that time. The acquisition of California and other territory, the discovery of gold, followed by unprecedented immigration through and across the Indian country, demanded a further increase of the army, and in 1855 Congress authorized two regiments, the First and Second Cavalry, which were organized and sent at once to duty upon the Western frontier. Encroachments upon Indian lands and the ever-increasing tide of emigration flowing constantly beyond the border settlements caused incessant conflict with Indian tribes scattered from British Columbia to the Mexican boundary, and from the Missouri River to the Pacific Ocean. With scant necessities and no luxuries in post or field these fine regiments so impressed themselves upon the Indian tribes with whom they came in conflict that the punitive lessons were of untold value when the Civil War caused a general withdrawal of the regular troops from the frontiers. During all the period from their organization until 1861 the regiments had retained their designations of Dragoons, Mounted Rifles, and Cavalry. The drill regulations in vogue during this period were adapted from those in use by the French army and while they now appear somewhat cumbersome, they served well their purpose. These regiments were very efficient mounted organizations and were the schools wherein were trained many of the most successful generals of the Civil War. Their gallantry was attested on many fields in the Florida war, the Mexican war, and upon the great plains of the West. They uncomplainingly endured untold hardships

by flood and field, especially in the Utah campaign, and fixed a composite type of cavalry upon which all were reorganized in 1861, and which served as a model for the organization of the 272 regiments of cavalry mustered into service during the Civil War.

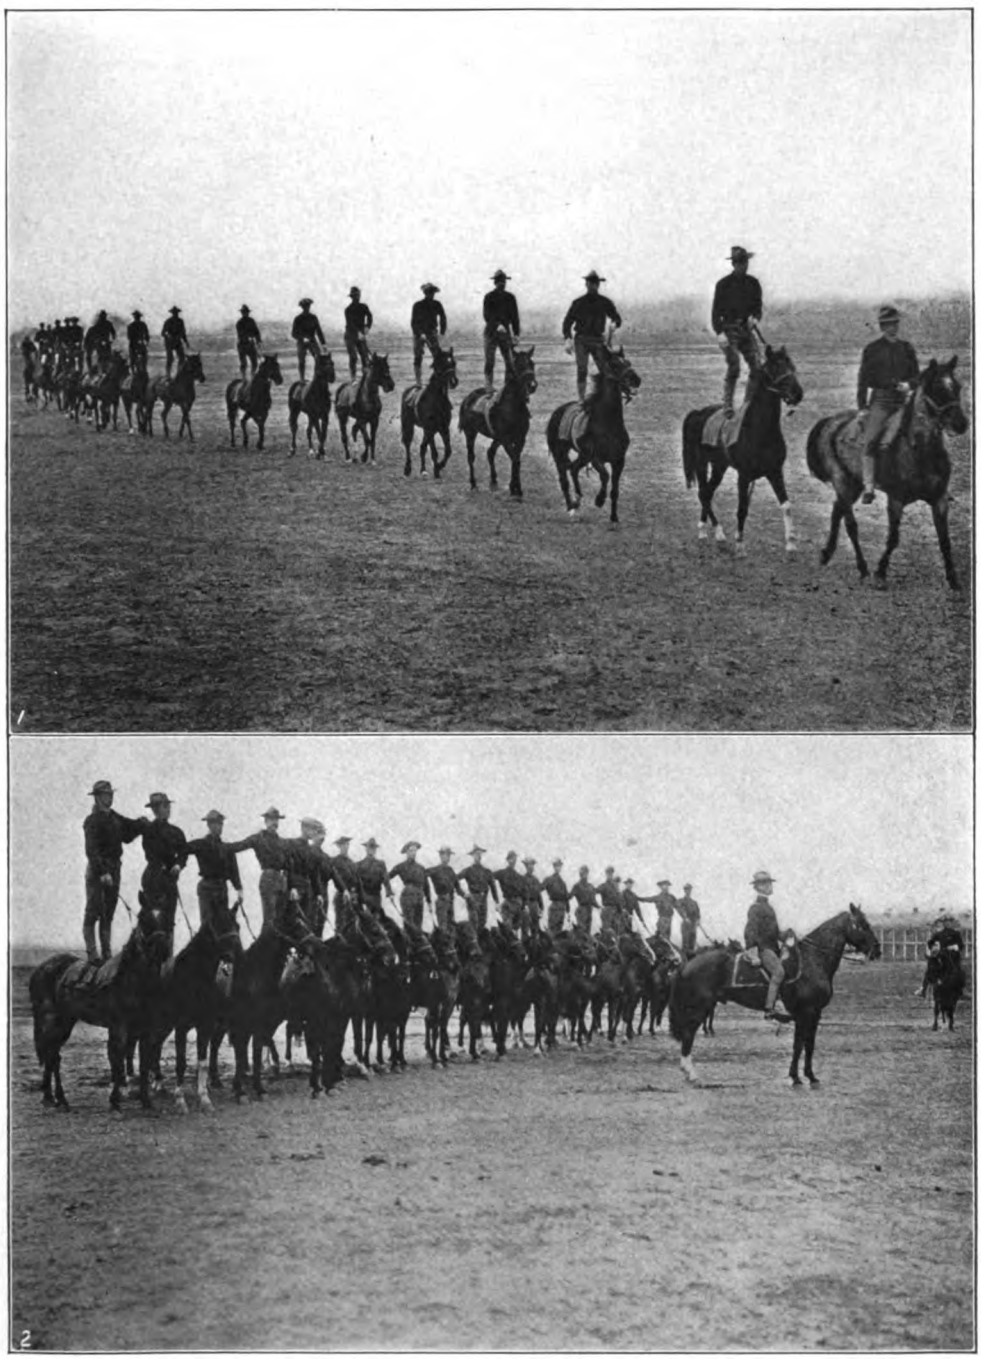
In 1861 Congress authorized the organization of the Third regiment of cavalry, but immediately after abolished the terms dragoons and mounted rifles, and designated all the regiments as cavalry, giving them numerical designations in the order of their original organization. It was not, however, until 1862 that the old regiments were given the same organization as the new regiment. Prior to this time the regiments were organized on the European model of five squadrons of two troops each. Both the regular and volunteer regiments were organized with 12 troops each and the tactical organization of squadrons of two troops each was continued. The dragoons had secured a high place upon the roll of honor through their gallantry and dash in the Mexican war, and all the regiments had emerged from the period of Indian conflicts with justifiable pride. All experience previous to the Civil War had been limited to meeting emergencies arising in dealing with cunning and relentless savages. A new field of action was now presented when the necessity arose for the organization of larger tactical bodies of cavalry than had ever before been required in this country. Millions were expended in putting into service volunteer cavalry regiments under the prevailing idea that patriotism made invincible soldiers. Much discouragement and an enormous waste of public funds resulted. It was only after a year or two of experience and a thorough weeding out that the Union cavalry became worthy of the reputation which quickly came in the wake of its great successes. The Confederate cavalry was composed entirely of those who could supply their own mounts. This drew to that arm a class of young men accustomed to horseback riding from infancy and usually possessed of a knowledge of firearms. This gave them a great advantage over their opponents, which they maintained during all the early period of the Civil War. Inability to supply themselves with remounts, together with the gradual improvement of the Union cavalry brought about a change, and during the last two years of the War the services of the cavalry under Sheridan, Wilson, and other gallant leaders, placed upon the pages of history a continuous record of victories. Operations which became known by the generally accepted title of raids, were conducted by both armies. Legitimate raids, carefully planned and executed with celerity and decision have become recognized as valuable adjuncts of the operations of armies. A large number of so-called raids during the Civil War, on both sides, were demanded by no military necessity, and resulted in excessive losses of horses without coresponding benefits to the general plan of operations.

Throughout the Civil War the question of supplying the cavalry with horses was a very serious one. The waste of animals due to ignorance was great, but the widely extended field of operations, the difficulty of supplying forage, the improper use of cavalry, and the continuous fatigue incident to raids placed strains upon the powers of endurance of the horses which few could withstand.

Deaths due to wounds received in battle constitute but an insignificant part of the losses of cavalry horses in war. It was with a view to both increased economy and efficiency that after a war experience of two years a cavalry bureau was established. An enormous number of horses broken down through excessive marching and fatigue were turned in at the several depots and recuperated sufficiently to be again issued. This was but a fraction of the whole number supplied, owing to the difficulty of returning worn-out horses from distant and isolated points. Some idea of war losses may be had from the statement that there were purchased during the fiscal year ending 30 June 1864, 188,718 horses. During the first eight months the cavalry of the Army of the Potomac was supplied with two complete remounts which required 40,000 horses. The total number of horses and mules required to keep up the supply was 500 a day, and the data collected showed that for every two men of the whole army one animal was required in the ranks or trains. The recent experience of the British army in South Africa indicates that the loss of animals in the Civil War was not exceptional and that whenever campaigns are undertaken in a sparsely settled country history will repeat itself.

The organization, equipment, and methods of employment of cavalry in the Civil War gradually became quite uniform and have since been clearly recognized as the American system. The cavalry was armed with breech-loading magazine carbines, while the infantry continued to the end of the war to use the muzzle-loading rifle. This accounted for the superiority of fire action whenever the cavalry fought dismounted. There was no inclination to avoid mounted fighting with sabre or pistol whenever cavalry was opposed by cavalry on suitable ground, but the most efficient fighting, and that which gave the best results was accomplished by dismounted fire action. The regiments were uniformly armed with breech-loading carbine, pistol, and sabre. The horse equipment consisted of a McClellan saddle-tree covered with rawhide, a saddle blanket, a pair of small saddle-bags, halter and bridle with single rein and curb bit. The arms and equiment have continued to find favor and remain the same in name, but modernized and improved to the highest known standard. There is no stagnation in such matters and experimentation is continually going on with a view to improvement. At the present time (1903) the improved saddle-tree is covered with stuffed russet leather and the saddle-bags are much larger than those formerly used, a change brought about by the necessities of frontier service subsequent to the Civil War. The new carbine will be second to none in the world in the essentials of penetration and trajectory.

The present organization of the cavalry regiments is the same as that adopted in 1862 except that a squadron now comprises four troops instead of two. This makes the number of squadrons in each regiment three, which corresponds with the number of majors and admits of treating the squadron both as an administrative and tactical unit. The number of regular regiments continued at six throughout the Civil War, but was increased to 10 in 1866, because of the requirements of protection for the frontier. As the Indian lands became circumscribed by the settlements, some of the regiments were with-



UNITED STATES CAVALRY EXERCISES.

Non

drawn from the frontiers and larger garrisons were established with a view to better instruction. The school of practice which existed during the continuance of Indian hostilities could not well be improved upon as a means of development of self-reliance, woodcraft, and the ability to care for one's self generally in the field. The cessation of savage warfare made it necessary to devise schemes of instruction, having for their object the training of the younger generation of soldiers in campaign duties. Although the American cavalry has not been tested in mounted combat with the cavalry of any of the great military powers of modern Europe, it has proved its efficiency and worth upon many fields. During the Santiago campaign of 1898, in the island of Cuba, owing to insufficient transports, the regular cavalry division participated dismounted. The regiments performed every duty required of the infantry and sustained the reputation for gallantry and efficiency won upon many previous fields of the Civil and Indian wars. The same degree of success has followed the cavalry operations in China and the Philippines. Complete success was lacking in the operations against the Philippine insurgents until a cavalry brigade, provided with pack mules for transporation of rations, was put in the field. It then became possible to follow up the insurgent army, which rapidly fell to pieces and began the guerrilla warfare, which characterized the later days of the insurrection. The continuance of the insurgent warfare, together with the conditions existing in China, made it necessary to reorganize the United States army and by an increase of its personnel to make practicable the release from active service of about 35,000 volunteers who had been enlisted and sent across the seas at great expense.

In undertaking this reorganization, the experience of the past 50 years was carefully studied and many changes introduced, although as a matter both of expediency and compromise many desirable reforms were omitted. Notwithstanding the prevailing political prejudices against modification of the military system, there is no more conservative institution in all America than the regular army of the United States. In determining upon the organization of the cavalry, and of the field artillery also, it was recognized that the organized national guard of the country is composed almost wholly of infantry. The expense of mounted troops is very great and it is quite certain that at the outbreak of war of any magnitude, no reliance could be placed upon volunteer cavalry for mounted action within a less period than one year. Under the last reorganization of the army, a cavalry force of 15 regiments was provided. The American regiment is composed of three squadrons of four troops each, with a minimum number of 65 and a war strength of 100 men to each troop. The European and British cavalry still retain the small squadron of two troops and with four or five squadrons to each regiment. The American cavalry squadron with ranks completely filled to war strength, would be somewhat unwieldy, but the numbers have been fixed as the result of much experience, all of which tends to prove that troops in barracks never march to the field with full ranks, and that after a brief campaign the numbers become still further reduced through weeding out of unfit men and horses. Every effort is made to perfect the organization and equipment, but some of the most pronounced lessons of the Civil War are still neglected. The recently authorized general staff corps is regarded as the means through which our past and future military experiences will be profitably studied and the results made available for practical application in the regular and volunteer armies, which, under the laws of the country, constitute, in time of war, the «Army of the United States.»

GEN. W. H. CARTER,
Army War College, Washington, D. C.

Cav'an, Ireland, a county in the province of Ulster, having Fermanagh on the north, Leitrim on the west, and Longford and Westmeath on the south; area, 746 square miles. In the northwestern part is a range of hills called the Ballymageeragh Mountains, but the remaining surface, which is undulating and irregular, is pervaded by bog and interspersed with many fine lakes. The chief rivers are the Erne, the Woodford, the Blackwater, and the Annalee, and the chief lakes Lough Ramor, Lough Sheelin, Lough Gowna, Lough Oughter, and Upper Lough Erne. Much of the soil of this county is cold, spongy, and inclined to be rushy. The chief cereal crop is oats, the chief green crop potatoes. Wheat is little cultivated; flax is raised to some extent, and the high lands are good for grazing. Linen-bleaching and the distilling of whiskey are the chief industries. The principal towns are Caven, Cootehill, and Belturbet. Pop. (1901) 97,368.

Cavan, Ireland, a town, capital and chief business centre of the above county, 57 miles northwest of Dublin. There are churches for the Episcopalians, Roman Catholics, Methodists, and Presbyterians, an endowed school founded by Charles I., municipal and county offices, jail, union workhouse, a court-house, an infirmary, a fever hospital, and a Roman Catholic college. Pop. 3,000.

Cavanilles, Antonio José, än-tō-nē'ō hō sā' kä-vä-nēl'yĕs, Spanish clergyman and botanist: b. Valencia 1745; d. Madrid 1804. In 1777 he went to Paris and remained there 12 years, occupied with the study of several sciences, but chiefly with botany. He published there, in 1784, 'Observations on the Article Spain in the New Encyclopedia,' written with as much patriotism as profound reasoning. In the following year he commenced his great botanical work, 'Monadelphiæ Classis Dissertationes decem' (Paris 1785–9; Madrid 1790, 4to, with engravings). After his return to Spain he wrote 'Icones et Descriptiones Plantarum, quæ aut sponte in Hispania crescunt aut in Hortis hospitantur' (1791–9, 6 vols. folio, with 601 engravings). It contains a number of new genera and species, natives of Spain, America, India, and New Holland. In pursuance of a commission from the king, Cavanilles traveled in Valencia, and collected the materials for his 'Observaciones sobre la Historia Natural, Geografia, Agricultura, Poblacion, etc., del Reyno de Valencia' (1795–7, 2 vols. folio, with copperplates from the drawings of the author). The work was published at the expense of the king, and intended as the first part of a similar work to embrace the whole of Spain. Thunberg has named a family of plants Cavanilla.

Cavatina, kăv-a-tē'na, in music, a short operatic air without a return or second part, sometimes relieved with recitative, but now extended to the aria generally, especially if the character of expression is tender, hopeful, or joyous. In this elegant and gracefully melodic class of composition the Italians naturally eclipse all other musicians; yet the *Il mio Tesoro* of Mozart will bear comparison with the finest cavatinas ever written.

Cave, Edward, English printer, founder of the 'Gentleman's Magazine': b. Newton, Warwickshire, 27 Feb. 1691; d. London 10 Jan. 1754. His first occupation was that of clerk to a collector of the excise in the country. He then went to London, and put himself apprentice to a printer. When his indentures expired he obtained a place in the post-office, and employed his leisure in writing for the newspapers. He published in January 1731 the first number of the 'Gentleman's Magazine,' which, under a considerably modified form, has continued till this day. Cave was deprived of his place in the post-office on account of his having resisted some abuses relative to the privilege of franking letters. During his last illness Dr. Johnson (who subsequently wrote his life) was often an attendant by his bedside.

Cave, Henry William, English artist and traveler: b. Brackley, Northamptonshire, 1854. He was educated at Queen's College, Oxford, and in 1877 founded the commercial establishment of Cave & Company at Colombo, retiring in 1887. He has published 'Colombo and the Kelani Valley' (1893); 'Kandy and Peradeniya' (1894); 'Nuwara Eliya and Adam's Peak' (1895); 'The Ruined Cities of Ceylon' (1897); 'Golden Tips,' a description of Ceylon' (1900).

Cave, or **Cavern,** an opening produced by nature in the solid crust of the earth. Caves are principally met with in limestone rocks, in gypsum, sometimes in sandstone, and in volcanic rocks (basalt, lava, tufa, etc.). The form of the caves depends partly upon the nature of the substance in which they exist; but it is frequently altered by external causes. Out of some caverns rivers take their course; others again admit rivers, or may be said to swallow them for a space. There are many and various causes for the formation of caves. Those in limestone and gypsum are unquestionably the results of the dissolving power of water; in fact the almost perfectly uniform direction, the gentle and equable declivity of most caves, appear to be the effect of the long continuance of water in them, the action of which has widened the existing crevices. In trachyte and lava, caves appear to have been produced by the effects of gas. The caves of gypsum often contain foul air; the caves of limestone, various figures of stalactites, produced by the deposit of the lime dissolved in the water. Many of these lime caves contain remnants of bones of animals, such as hyænas, elephants, and bears. See CAVE-DWELLERS.

Many caves are remarkable only on account of their great size, or sublime from the awful gloom which pervades them, and the echoes which roll like thunder through their vaulted passages. Some are of great depth, as that of Frederikshall, Norway, which is calculated to be 11,000 feet in depth. One of the grandest natural caverns known is Fingal's Cave (q.v.) in Staffa, one of the Western Islands of Scotland. Its sides are formed of ranges of basaltic columns, which are almost as regular as hewn stone. The grotto of Antiparos, on the island of the same name, in the Grecian Archipelago, is celebrated for its magnificence. The roof is adorned with stalactites, many of them 20 feet long, and hung with festoons of various forms and brilliant appearance. In some parts immense columns descend to the floor; others present the appearance of trees and brooks turned to marble. The Peak Cavern in Derbyshire, England, is a celebrated curiosity of this kind. It is nearly half a mile in length; and, at its lowest part, 600 feet below the surface. Other famous stalactitic caves are the Luray Cavern (q.v.), Page County, Va.; one near Matanzas, Cuba; one near Adelsberg, Carniola; the Wyandotte Cave (q.v.), Crawford County, Ind.; and Madison's Cave, in Rockingham County, Va. The caves of Kirkdale, in England, and Gailenreuth, in Germany, are remarkable for the quantities of bones of the elephant, rhinoceros, and hyæna found in them. In the rock of Gibraltar there are a number of stalactitic caverns, of which the principal is St. Michael's Cave, 1,000 feet above the sea. Other celebrated caves in America are Weyer's Cave, in Augusta County, Va., extending 800 yards, but extremely irregular; the Colossal Cavern, Ky. (q.v.), discovered in 1895, and the Mammoth Cave (q.v.) in Edmondson County, Ky., which encloses an extent of about 150 miles of subterraneous windings. One of its chambers, called the Temple, covers a space of nearly five acres, and is surmounted by a dome of solid rock 120 feet in height. The Cumberland Mountains, in Tennessee, contain some curious caverns, in one of which, at a depth of 400 feet, a stream was found with a current sufficiently powerful to turn a mill. Another cave in the same State is named Big Bone Cave, from the bones of the mastodon which have there been discovered. In the Raccoon Mountains, near the northwestern extremity of Georgia, is Nickojack Cave, 50 feet high and 100 feet wide, which has been explored to the distance of three miles. A stream of considerable size, which is interrupted by a fall, runs through it. Caves are sometimes found which exhale poisonous vapors. The most remarkable known is the Grotto del Cane, a small cave near Naples. In Iceland and Hawaii there are many caves formed by the lava from volcanoes. In the volcanic country near Rome there are many natural cavities of great extent and coolness, which are sometimes resorted to as a refuge from the heat. In South America is the cavern of Guacharo, which is said to extend for leagues. For information concerning human and animal remains in caves, see CAVE-DWELLERS.

Cave Animals, or **Cave Fauna,** an assemblage of animals of different classes which are blind and either totally or partially eyeless.

Distribution of Cave-Regions.— In the United States the caves containing permanent inhabitants are situated south of the former region of glaciers, that is, in Mammoth and adjoining caves in Kentucky; Wyandotte and smaller caves in Indiana; caves in Carter County, Ky., and Weyer's and the Luray caverns in Virginia. These regions have been honey-

combed by the action of subterranean streams now dried up. With these systems of subterranean drainage are associated sink-holes, and deep, dark wells inhabited by blind fish, crayfish, and other crustaceans of the same species as those inhabiting the caves. Other caves more or less tenanted by blind forms are situated in Mexico, in open sink-holes in Cuba, as well as in caves and wells in New Zealand. Rich cave faunæ are found in southern France, and in limestone deposits near or at the base of the Pyrennes, though the great grotto of Adelsberg, near Trieste, is the classic abode of cavernicolous forms, including the blind triton, eyeless beetles, etc.

Mammoth Cave (q.v.) is the type of a great system of underground passages and chambers where these blind animals live. The total length of its avenues is about 150 miles. In the older and dry passages and chambers there is little life; the animals are mostly found in the newer and damp places, the aquatic forms living in the streams and pools. There is no vegetation except a few scattered molds and fungi. The food is scanty, and the animals are carnivorous, preying on one another. The temperature is very equable, the mean for the winter months being 53° F., and for the summer 54° F. The number of species thus far detected in Mammoth Cave is about 75, and in other American caves about 40 or 50 more, while several hundred kinds exist in European caverns.

Blind Fishes.— The most striking and interesting form in Mammoth Cave is the blind-fish (*Amblyopsis spelæus*). It is about four inches long, colorless, and blind, the eyes being vestigial. This fish seeks the dark and shuns the light, being much disturbed by a lighted match or bright sunlight, or even by a ray of light. In well-fed adult specimens there is no external indication of an eye; but in young ones, before reaching a length of two inches, the eyes can be distinctly seen, owing to their pigment, which is lost in the adult. The optic nerve can be traced in examples under an inch in length, but in large specimens the nerve to the brain cannot be followed. The lens is much reduced, and, in fact, the vestiges of the eyes are exceedingly variable. This will apply to the eyes of other blind fishes and blind insects, crustacea, etc. While the sense of sight is lost, that of touch in the blind-fish, as in most other cave animals, is exalted. *Amblyopsis* is provided with tactile papillæ, arranged in ridges on the front and sides of the head. Though the ears of this blind-fish are said by some authorities to be largely developed, others state that they manifest total indifference to light and sound. They are said to show extreme timidity and caution in their movements.

Blind Salamanders.— A still higher type of vertebrate, two species of salamanders have become adapted to cave life, losing their eyesight by disuse. The species of the genus *Spelerpes* frequent damp, dark situations and the entrances to caves. An allied form (*Typhlotriton spelæus*) is distinctly a cavernicolous as distinguished from a twilight species, and has never been found outside of caves. Its eyes show early stages of degeneration. It inhabits caves in southwestern Missouri, and occurs under rocks in and out of water. Still another salamander, whose eyes are the most degenerate known among amphibians, is the *Typhlomolge rathbuni*. It lives in subterranean streams, tapped by an artesian and also a surface well, near San Marcos, Texas, and likewise occurs in one of the caves near that town. Its remarkably long and slender legs are too weak to support its body when out of water. The eyes of this salamander are in many respects much more degenerate than those of the *Proteus* of Austrian caves.

The lower animals tell the same story of degeneration, blindness and total or partial atrophy of the eye, together with loss of color, and, in a more striking way, the compensation for the loss of vision by a great increase in length of the antennæ and other appendages, or the growth of long, slender tactile bristles.

Blind Crayfish and Other Crustacea.— The blind crayfish (*Orconectes pellucidus*) is a common cave form. It differs from its out-of-door allies in being blind, slender-bodied and colorless. The eyes are present, but they are much reduced in size, and destitute of a cornea and of black pigment, while the colorless body is slender. It is not only blind, but deaf, and exceedingly timid and cautious in its movements. Other blind or eyeless crustaceans are various kinds of amphipods and isopods, both aquatic and terrestrial, of which species of *Cæcidotea*, allied to the *Asellus*, a common crustacean of fresh waters, are the most abundant, and form the food-supply of the blind crayfish.

Blind Insects.— The eyeless beetles of caves (*Anophthalmi*) have no vestige of eye or of optic nerves and ganglia, while their bodies and appendages are slender. They grope their way about by means of very long tactile bristles. Other beetles, such as *Adelops*, which have retained vestiges of the outer eye; some spiders comprising an eyeless species, and others with eyes varying in size, some much reduced, spin little webs on the walls of the chambers. Among the harvestmen some (*Phalangodes*) have extraordinarily long legs; while the *Campodea* (q.v.), a wingless insect of the Mammoth and other caves of the United States and Europe, differs from the outdoor form in its antennæ and abdominal appendages, being greatly exaggerated in length. There are also mites, myriapods, primitive wingless insects (*Podurans*), a few flies, worms, and infusorians.

Origin and History.— The fauna of caves is evidently composed of the descendants of individuals which have been carried by various means into the subterranean passages, have become adapted to life in perpetual darkness, becoming isolated, and thus, as long as they are subjected to their peculiar environment, breed true to their species, and show no tendency to relapse to their originally eyed condition. The absence of the stimulus of light causes the eyes, through disuse, to undergo reduction and atrophy. With this goes, in certain forms, the loss of the optic ganglia and optic nerves. I have found and stated the following effects of disuse in the invertebrate animals of Mammoth and other caves, and from these statements it will be realized how profoundly the organisms have been modified:

1. Total atrophy of optic lobes and optic nerves, with or without the persistence in part of the pigment or retina and the crystalline lens (certain *Crustacea*, harvestmen, *Adelops*, beetle, and the myriapod *Pseudotremia*).

2. Persistence of the optic lobes and optic nerves, but total atrophy of the rods and cones, retina (pigment), and facets (blind crayfish).

3. Total atrophy of the optic lobes, optic nerves, and all the optic elements, including rods and cones, retina (pigment) and facets (*Anophthalmus* beetle, and the myriapod *Scoterpes*).

An interesting fact, confirmatory of the theory of occasional rapid evolution, as opposed to invariably slow action involved in pure Darwinism, is that we never find any vestiges of the optic lobes or optic nerves; if they are wanting at all, they are totally abolished.

Compensations for Loss of Eyesight.— On the other hand, certain other parts of the body, as the result of use, become extraordinarily developed; such are the tactile papillæ of the blind-fish, the greatly lengthened feelers and legs, the long, delicate tactile hairs of various *Crustacea* and insects. It is plainly the case that the enhanced development of these organs is the result of frequent use of exercise. There is no need of invoking natural selection, these parts developing as the direct result of the change of habits, of the new needs of the animals to feel their way about, forced to adopt such habits by the abnormal conditions of their existence. Although the animals are members of very different groups, inheriting very different structures and habits, yet all genuine cave animals resemble each other in being pale, and ghost-like, in the exaltation of the tactile sense, and the corresponding increase in length and delicacy of the extremities.

Theories of the Origin of Cave Forms.— Darwin attributed the loss of eyes to disuse, stating that natural selection was not operative. Packard stated the view that the loss of eyes was attributable to the Lamarckian facts of change of environment, and consequent disuse, isolation, and use-inheritance. The latest author, Eigenmann, concludes that the Lamarckian view — that through disuse the organ is diminished during the life of the individual, in part at least on account of the diminution of the amount of blood going to a resting organ, and that this effect is transmitted to succeeding generations — not only would theoretically account for unlimited progressive degeneration, but is the only view so far examined that does not on the face of it present serious objections.

An underground laboratory for the study of cave animals has been established by M. Viré in the old catacombs and underground quarries extending under the Jardin des Plantes in Paris. Here are all the conditions of a cave, namely, perpetual darkness, an unvarying temperature, and running water for aquatic forms. M. Viré has introduced various blind and eyed species, and eventually we may expect to have much light thrown on the interesting problems suggested by such studies as these. Great activity has been shown in France in the exploration of the caves and subterranean streams of the Midi; and a Société de Spéléogie has been organized for several years.

Eigenmann, 'The Eyes of the Blind Vertebrates of North America' (Archiv Entwickelungsmechaniks der Organismen, Vol. VIII.); and other papers. Consult also the writings of Tellkampf, Schiödte, Cope, Putnam, Garman, Henshaw, Joseph, Chilton, and others.

ALPHEUS S. PACKARD,
Brown University, Providence, R. I.

Cave-bear, an extinct species of European bear closely allied to the living grizzly, but attaining a larger size. Its remains are found in bone-beds in caverns, whence the name. The habits of the animal were probably not different from those of modern bears. The cave-bear of South America is a different animal (see ARCTOTHERIUM). Both species are found in the larger caverns of North and South America.

Cave-dwellers, prehistoric men dwelling in caves, and cave-dwelling animals of corresponding periods; also cave-dwelling men of more recent historic times. Long before the dawn of authentic history, primitive races of men dwelt in large numbers in natural caverns, which were often shaped, enlarged, fortified, or furnished by the occupants. The ages in which the prehistoric cave-dwellers lived are usually called the Palæolithic, or Ancient Stone Age, and the Neolithic, or Later Stone Age. Many caves have been explored in England, France, Belgium, Spain, America, and Australia; notably a famous cave known as Kent's Hole, in Devonshire, England, caves at Brixham and Périgord, and the Madeleine Cave on the Vezère River, France. In the Neolithic Age numerous human skeletons are found, but very few in the earlier age. It is believed that some of these human remains possibly antedate the glacial drift period of Europe. The remains found in the caves are ordinarily overlaid with deposits of varying thickness and different qualities. In Kent's Hole, near Torquay, there were found four distinct strata of deposits overlying the cavern floor: the surface layer a dark earth containing Neolithic and Roman remains, the second layer a thin stalagmite floor, the third a stratum of red earth containing flint implements and bones of animals, and the lowest deposit consituting a hard breccia, in which human and animal remains of a ruder and earlier period were found.

Caves in which the bones of extinct animals are found owe their origin, for the most part, to the action of rain-water on limestone rocks, in which they most frequently occur. The deposit contained in these caverns usually consists of clay, sand, and gravel combined. In this deposit are imbedded remains of animals, and stones either angular or rounded. The bones scarcely ever occur in entire skeletons, but are scattered in such a way as to show that they must have been moved from their places subsequent to the death of the animals. They seldom, however, have suffered much from friction; and at times look so fresh that, but for the complete abstraction of the animal matter which they must have originally contained, they might be supposed to have been brought into the cavern a few weeks before. The most remarkable fact with regard to these bones is that the most of them belong to animals which do not now exist at all, or exist only in regions far remote from those where caverns occur. Some of those found in European caverns belong to animals now found only in the tropical or sub-tropical regions, and others are the re-

mains of animals now living in more northerly areas, while others, although evidently molded on types similar to those of existing animals, differ from them in several essential features. To add to the difficulty of explanation, human bones have repeatedly been found mingled with those of the lower animals. The evidence of the cave remains proves the co-existence of man with animals not now living in the same areas; of these animals some are now extinct, as the cave-bear (q.v.) and cave-lion, the mammoth, and mastodon, the tichorhine rhinoceros, etc.; others have only migrated. Thus the reindeer is no longer found in southern Europe; the *Hyæna crocuta,* found in the Gibraltar caves, now lives in South Africa. The ibex, the chamois, and a species of ground-squirrel, once lived in the Dordogne, but are now found only on the heights of the Alps and Pyrenees. Thus it is evident that a considerable change of climate has taken place in Europe. Man's relation to these extinct animals, and his existence at the time these changes took place, are demonstrated by the discovery in the caves of human bones and worked flints beneath layers of hyæna droppings, as in Wokey's Hole, near Wells; mixed up indiscriminately, as in Kent's Hole, with bones of elephant, rhinoceros, hyæna, etc.; and by the fact that many bones of the extinct animals are split up, evidently for the sake of the marrow. In the Dordogne and Savigné caves fragments of horn have been found bearing carved — or, rather, deeply scratched — outline figures of ibex, reindeer, and mammoth. The bones of the reindeer are found in large numbers, some of them showing that the flesh had probably been cooked. It is believed that this animal was a chief article of food with the cave-dwellers. Implements of flint and stone are mingled with the remains. Among the non-extinct animals known to have dwelt in the caves with men, or to have been carried there for food, or to furnish their skins for clothing, are the mammoth, musk-ox, horse, dog, bison, rhinoceros, and hyæna. In 1820 Dr. Buckland explored a cave at Kirkdale, in Yorkshire, England, and proved that it had been inhabited by great numbers of hyænas that had dragged into it many other animals. Among the remains found in Europe nothing has been shown to indicate that the cave-dwellers domesticated any animals, or used them for anything but food and clothing. Needles of ivory are found, leading to the inference that they knew how to sew skins together for garments. No traces of agriculture, and no implements used in agriculture, have been discovered. Lance-heads, arrow-heads, hammers, saws made of flint, and harpoons, have been found. The great number of fish-bones found, showing marks of cookery, indicates that they engaged in fishing extensively, but the variety of bird remains indicates their inferior skill in catching or killing winged creatures. They probably had no spinning implements and did not know the art of pottery.

In the cave of Cro-Magnon in the south of France skeletons were found that are accepted by palæontologists as those of genuine cave-men. Taking them as the type, it is inferred that the Palæolithic cave-dwellers were a tall, powerfully built race, with long narrow skulls, broad faces, and powerful jaws. Investigations in the Belgian caves seem to indicate that the cave-men of that region were of much smaller stature, but with symmetrical, well-shaped bodies. The traces of the most ancient cave-men found in Europe are believed to identify them ethnically with the Esquimau. The bone needles, harpoons, arrow- and spear-heads, and scrapers, are much like those of the Esquimaux. The designs of their carvings also are much the same, as well as their habit of accumulating piles of bones around their dwellings, which they were accustomed to split for the marrow. The habitat of animals now common in the Arctic region, where the Esquimaux live, has shifted to the north, and their migration has been traced with the subsidence of climates, from Europe to the regions where the species that have survived now live. It is believed that the Esquimau in the same way is the descendant of the Palæolithic cave-dweller, who has gradually receded to the north.

The caves belonging to the Neolithic Age yield remains classified into three ages: Neolithic (proper), Bronze, and Iron. They are widely distributed throughout Europe, and contain celts, flints, flakes, rude pottery, bones of the pig, dog, horse, sheep, and goat, with those of many wild animals still indigenous in Europe, and of some that are extinct, and many human skeletons. The latter show that the people populated the caves in great numbers. They were a race of short-statured people having common resemblances in various regions of Europe. They were in some regions cannibals, and slightly in advance of the Palæolithic races in the variety of their implements and occupations. Their gradual progress down to the dawn of history is shown by the substitution of bronze, and then of iron, in place of the stone of earlier ages for implements and weapons.

In America, caves with human remains have been investigated in Brazil, Ohio, Kentucky, Minnesota, Arizona, Colorado, Nevada, Utah, and California. There are remains that have been deposited within the period of authentic history. The conclusions drawn from cave remains, as to the antiquity of man, are subject to the doubts that beset all calculations as to the rate of deposit of geological strata and to the rapidity of changes in climates and zoological characteristics. See MOUND-BUILDERS.

Cave-temple, a cave used as a temple; but the name is especially applied to temples excavated in the solid rock, such as exist in considerable numbers in India.

Caveat, kā'vē-ăt (Lat. "let him beware") in law, a notice served upon a public officer or court to refrain from doing a certain act without first giving notice to the caveator, as the person is termed who enters the caveat. Perhaps the best-known use of the caveat is its entry by an inventor in the Patent Office for the purpose of establishing his claim to priority of invention, by enjoining its officers from issuing letters patent for any invention interfering with or infringing the rights claimed by the caveator, without first giving him notice of the application for such letters patent. The terms of the caveat must set forth the claims of the inventor and the details of his invention with sufficient particularity to enable the officials of the Patent Office to determine whether a subsequent application for letters falls within the claims of the first inventor. If such is the case the caveator is entitled to notice of such inter-

fering application, and the new applicant's claim to letters is suspended for three months, during which period the caveator must complete his specifications and file his own application for letters patent. If no interfering application is filed, the caveator's rights remain valid for one year, and may be renewed at the end of that term, for one year more, on payment of a second fee. Other uses of the caveat are to prohibit (without notice to the caveator) the admission of a will to probate, the enrollment of a decree in chancery, the grant of letters testamentary to an executor, the issuing of a commission *de lunatico inquirendo,* etc. On the filing of such a caveat and due notice being served thereunder, a hearing is had before a competent tribunal for the determination of the rights in the matter.

Caveat Emptor, a rule of law that warns the purchaser to take care and examine properly before he buys it. In sales of real estate the purchaser's right to relief depends on the covenants in the deed in the absence of fraud on the part of the vendor. In 1 Serg. & R. 42, the rule is stated as follows:

> "The rule of *caveat emptor* strictly applies to the purchase of lands, and the consideration-money cannot be recovered back after a deed executed, unless in case of fraud, where some covenant inserted in the deed has been broken. The purchaser has it in his power to protect himself by proper covenants, and there is no reason why the law should provide to him a remedy, where he himself has been wholly inattentive and negligent in this particular."

In sales of personal property the purchaser buys at his own risk, in the absence of an express warranty by the seller, or when the law does not imply a warranty from the circumstances of the sale or the nature of the thing sold, and when the seller was not guilty of a fraudulent misrepresentation or concealment. The purchaser must examine the quality of the goods bought and rely upon his own judgment. Generally, if the article purchased is defective, and an examination, such as a reasonable and prudent man would make, would enable him to see the defect, it is not a fraud on the part of the seller not to call his attention to it.

At common law in the city of London, the law of market overt applied to all stores where articles in that particular line were sold. The purchaser got a good title, but as to the quality the purchaser must examine and judge for himself, unless the seller give him an express warranty.

Cavedone, Jacopo, yä'kō-pō kä-vĕ-dō'nā, Italian painter: b. Sassuolo, in the duchy of Modena, 1577; d. Bologna 1660. He was a pupil of Annibale Carracci. His best works are the 'St. Alo,' in the church of the Mendicanti at Bologna, the 'Adoration of the Magi,' the 'Four Doctors,' and the 'Last Supper.' Out of Italy he is frequently mistaken for Annibale Carracci.

Ca'ven, William, Canadian educator: b. Kirkcolm, Scotland, 26 Dec. 1830. He went to Canada with his father in 1847, studied theology at London, Ont., was ordained minister of the United Presbyterian Church, 1852, and was pastor of St. Mary's and Downie, 1852–65. In 1866 he became professor of exegetical theology and biblical criticism in Knox College, Toronto, and principal in 1873, having been chairman of the college board since 1870. He was a promoter of the union of the Canadian Presbyterian churches, moderator of the Church in 1875, and president of the Ontario Teachers' Association, 1877.

Cavendish, kăv'ĕn-dĭsh or kăn'dĭsh, **Frederick Charles,** Lord, second son of the 7th Duke of Devonshire, English statesman: b. Eastbourne 30 Nov. 1836; d. 6 May 1882. He sat in Parliament as Liberal member for the north division of the West Riding of Yorkshire from 1865 till the spring of 1882, when he succeeded Mr. Forster as chief secretary for Ireland. On the evening of 6 May, he and Mr. Burke, an unpopular subordinate, were stabbed to death in the Phœnix Park. Eight months later, 20 «Irish Invincibles» were tried for the murder, and, Carey and two others having turned queen's evidence, five of the rest were hanged, three sentenced to penal servitude for life, and the remaining nine to various terms of imprisonment. Carey himself disappeared; but in July news came from the Cape that he had been shot dead by an Irishman named O'Donnell on board an emigrant ship. O'Donnell was taken back to London and hanged.

Cavendish, George, English biographer: b. about 1500; d. about 1561. He became Wolsey's gentleman-usher at least as early as 1527. He remained in close attendance upon his great master till the latter's death, 28 Nov. 1530, after which he retired to his house at Glemsford, in Suffolk, where he lived quietly with his wife, a niece of Sir Thomas More, till the close of his own life. His affection for the great cardinal was most devoted, and his 'Life of Cardinal Wolsey' is one of the most interesting short biographies in the English language.

Cavendish, Henry, English chemist: b. Nice, Italy, 10 Oct. 1731; d. London 24 Feb. 1810. He was a grandson of the second Duke of Devonshire, and after his education at Peterhouse College, Cambridge, devoted himself exclusively to scientific research. He discovered the peculiar properties of hydrogen, and the qualities by which it is distinguished from atmospheric air. To him we owe the important discovery of the composition of water. Scheele had already observed that, when oxygen is mixed with double the quantity of hydrogen, this mixture burns with an explosion without any visible residuum. Cavendish repeated this experiment with the accuracy for which he was distinguished. He confined both the gases in dry earthen vessels, to prevent the escape of the product of their combustion, and found that this residuum was water, the weight of which was equal to the sum of the weights of the two gases. Lavoisier confirmed this conclusion in later times. Cavendish possessed a profound knowledge of the higher geometry, of which he made a very happy use in determining the mean density of the earth. He found it to be five and a third times greater than the density of water — a conclusion which differs but little from that obtained by Maskelyne in another way. Coulomb investigated the law of attraction between two electrified points directly by means of the torsion balance. Cavendish was, however, the author of the far more exact method of proving the law, which he expressed in the following syllogistic form. He demonstrates mathematically that, if the law of force be any other than the inverse square of the distance, electricity

could not rest in equilibrium *at the surface* of a conductor. But experiment has shown that electricity does rest in equilibrium on the surface of a conductor. Hence the law of force must be the inverse square of the distance. He himself made excellent experiments in order to support his minor premise. He did not, however, consider that his experiments justified him in holding the truth of it as thoroughly established, though he believed it to be true. Since his time the experimental researches of Faraday and others have completely demonstrated the truth of it, and therefore of the law above stated. Cavendish was a member of the Royal Society of London, and in 1803 was made one of the eight foreign members of the National Institute of France. His writings consist of treatises in the 'Philosophical Transactions,' from 1766 to 1792. They are distinguished by acuteness and accuracy.

Cavendish, Margaret, DUCHESS OF NEWCASTLE, English writer: b. Essex 1624 (?); d. 1674. She wrote 'Philosophical Fancies'; a collection of poems, 'The Pastime and Recreation of the Queen of Fairies'; 'Philosophical Letters' (1664).

Cavendish, or **Candish, SIR Thomas,** English navigator: b. Trimley Saint Martin, Suffolk, about 1555; d. at sea off Ascension Island, 1592. Having consumed his property by his early extravagances, he collected three small vessels for the purpose of making a predatory voyage to the Spanish colonies. He sailed from Plymouth in 1586, took and destroyed many vessels, ravaged the coasts of Chile, Peru, and New Spain, and returned by the Cape of Good Hope, having circumnavigated the globe in two years and 49 days, the shortest period in which it had then been effected. For this exploit he was knighted by the queen. In 1591 he set sail on a similar expedition, in which his principal success was the capture of the town of Santos, in Brazil.

Cavendish, William, Duke of Newcastle, English general: b. 1592; d. 25 Dec. 1676. On the approach of hostilities between the Crown and Parliament he embraced the royal cause, and was invested with a commission constituting him general of all his majesty's forces raised north of the Trent, with very ample powers. Through great exertions, and the expenditure of large sums from his private fortune, he levied a considerable army, with which, for some time, he maintained the king's cause in the north. In military matters he depended chiefly on his principal officers, it is said, but the numerous successes obtained by him render this unlikely. In 1643 he obtained a complete victory over Lord Fairfax on Adwalton Moor, and recovered all Yorkshire except Hull; but next year, on the arrival of the Scottish army and its junction with the parliamentary forces, threw himself into York. Having been relieved by Prince Rupert, he was present at the battle of Marston Moor next day, after which he left the kingdom. His term of exile was chiefly spent in Antwerp, where he was for a time so straitened in circumstances that he had on one occasion to pawn his wife's jewels. He returned, after an absence of 18 years, and was rewarded for his services and sufferings with the dignity of duke. His works include 'La Methode et Invention Nouvelle de dresser les Chevaux' (Antwerp 1657); 'A New Method and Extraordinary Invention to Dress Horses, etc.' (1667); some comedies of no merit; and several worthless poems.

Cavendish, William, English statesman: b. 25 Jan. 1640; d. 18 Aug. 1707. He was first Duke of Devonshire, was the son of William, third Earl of Devonshire, and was instructed with great care in classical literature. On various occasions he distinguished himself by his spirit and valor, and in 1677 began that opposition to the arbitrary measures of the ministers of Charles II. which caused him to be regarded as one of the most determined friends of the liberties of his country. Intimately connected with Lord Russell, he joined him in his efforts for the security of free government and the Protestant religion. On the trial of Lord Russell he appeared as a witness in his favor, and offered to assist him in escaping, after he had been sentenced to death, by changing clothes with him in prison. In 1684, having succeeded to his father's title, and being regarded as one of the most formidable opponents of the arbitrary designs of King James II., attempts were made to intimidate him, but without success. He took an active part in promoting the revolution, and was one of the first who declared for the Prince of Orange. His services were rewarded with the dignity of Duke of Devonshire. He still, however, maintained an independent bearing in Parliament.

Cavendish. See JONES, HENRY.

Cav'endish, tobacco which has been softened and pressed into quadrangular cakes, so called after Thomas Cavendish, the Elizabethan circumnavigator.

Cavendish Experiment. See GRAVITATION.

Ca'verypauk, India, a town of Hindustan, in the North Arcot division of Madras Presidency, 57 miles west-southwest of Madras. It is meanly built, and the adjoining fort, at one time a place of some strength, is now in ruins. A victory was gained here by the British under Clive over the French and their allies in 1752. Near the town is an immense artificial pond, eight miles long by three miles broad, by means of which a large tract of country is irrigated. It is perhaps the finest work of the kind in South India. Pop. 7,000.

Caviana, kä-vē-ä'nä, Brazil, an island 35 miles long and 20 miles wide. It lies in the north mouth of the Amazon, under the equator; is level, fertile, and well stocked with cattle. The small town of Roberdello is on its southeastern side.

Caviare, kăv-ĭ-ăr', a table delicacy prepared from the roe of the sturgeon, *Acipenser sturio* or *A. huso*. It is made in great quantities in Russia, especially at Astrakhan, where great quantities of sturgeon are caught in the Volga, and of late years the industry has developed in some of the western States of America. The roe is separated from the skin which encloses it, washed in vinegar, and dried in the sun. A quantity of salt is then rubbed in by hand, and the roe is put into a cloth and pressed to remove the liquor, after which it is packed in small kegs for the market.

Cavite, kä-vē'tä, Philippines, a province in the southwestern part of the island of Luzon, bounded on the north and northwest by Manila Bay, on the north and northeast by the province

of Manila, and on the south by Batangas; area, 510 square miles, with the dependent islands, 610 square miles. In the south and southwest the province is mountainous; in the northwest there is a gradual elevation, forming a fertile plateau. The chief products are coffee, sugar, fruits, and rice (in the lowland regions). In the towns of the interior, hemp and cotton cloth, and sugar are manufactured; in the coast towns the chief industries are salt manufacture and fishing. There is export trade in all these products. There is communication with Manila by water and good roads throughout the province, connecting the coast with the interior. The occupation of Cavite by United States troops was the first event of importance in the Philippines after the naval battle in Manila Bay, 1 May 1898. The government of the province was established under the provincial government act of 6 Feb. 1901; and later several of the dependent islands were added to the territory in Luzon. Pop. 134,500.

Cavite, Philippines, a town and capital of the province of Cavite, on the eastern shore of Manila Bay. A tongue of land about one and a quarter miles long, projecting due east, separates waters of Cañacao Bay on the north, and Bacoor Bay, inner harbor of Cavite, on the south. On this projection are situated fortifications and arsenal. The town is walled, and all the buildings are of stone; it has a parochial church, two convents, and a hospital. It has also several manufacturing industries, and is well equipped for building and repairing vessels. The Spanish fleet had its position off Cavite when attacked by Admiral Dewey on 1 May 1898. The town is the naval headquarters of the United States in the Philippines. Pop. 3,000.

Cavo Relievo, Sculpture in; called also **Coelanaglyphic** and **Concavo-convex Sculpture,** a system of relief in which the figures do not rise above the general surface of the stone, ivory or other material on which the carving is done. It may be looked upon as sculpture in relief, of which the background has not been cleared away in the usual manner. Again, it may be considered as sculpture of which the bounding line has been marked by a groove, generally wedge-shaped, that is with a section like a V: the slope of one side being left as the boundary of the pattern or design, while the other slope disappears in the general rounding of the figures. This sculpture, in architectural art, is almost confined to the Egyptian buildings of times before the Roman domination; but in minor decorative arts the Orientals do beautiful work in this way.

Cavour, kä-voor', **Camillo Benso,** COUNT DI, Italian statesman: b. Turin 10 Aug. 1810; d. 6 June 1861. He was educated in the military academy at Turin, and after completing his studies he made a journey to England, where he made himself acquainted with the principles and working of the constitution. In 1842 he returned to Turin, where shortly afterward he published in the 'Bibliothèque Universelle' of Geneva his 'Considerations on the Present State and Future Prospects of Ireland,' which were subsequently translated into English. With Count Balbo and others he established in 1847 the journal of the 'Risorgimento.' It was not, however, till after the battle of Novara that he entered that political arena in which his name has since become so famous. He became a member of the Sardinian Chamber of Deputies in 1849, and the following year succeeded Santa Rosa as minister of commerce and agriculture. In this office he set himself strenuously to promote the internal prosperity of the country by the establishment of railways and an improved system of postal communications. A new organization was given to the military and naval forces; and the monasteries were, with certain exceptions, suppressed. In November 1852 Cavour became premier, and not long afterward gave a signal proof of his statesmanship by the part which he took in cementing an alliance with Great Britain and France, and making common cause with these powers against the aggressions of Russia. The prestige thus gained to the arms of Sardinia was no less important than that acquired by her liberal and reforming policy in civil matters. The attitude, however, thus taken by Sardinia could not fail to prove extremely offensive to the neighboring power of Austria, to whose arbitrary and repressive measures the government of Victor Emmanuel displayed itself as a standing reproof, and whose supremacy in Italy was eminently jeopardized by the aspirations of Sardinia. A collision, therefore, was inevitable, resulting in the campaign of 1859. The intimate connection formed at that time with France, who lent her powerful assistance in the prosecution of the war, was mainly due to the agency of Cavour, who was accused by some on this occasion of having purchased the assistance of Louis Napoleon by unduly countenancing his ambitious projects. The marriage of Victor Emmanuel's daughter, the Princess Clotilde, with Prince Napoleon, was consummated in the early part of 1859, and the conclusion of the same year witnessed the cession of Nice and Savoy to France. In bringing about both of these results Cavour took a leading part. In 1860 Garibaldi's expedition to Sicily took place; but toward this and the subsequent movements of the Italian liberator, Count Cavour manifested an apparent coldness, which diminished somewhat his estimation in the minds of the more zealous Italian patriots. See Romilly, 'Reminiscences of the Life of Cavour' (1863); Dicey, 'Cavour: a Memoir'; Bianchi, 'La Politique de Cavour' (1885); 'Lives' by Massari (1873); Mazade (1877); Martinengo-Caesaresco (1897).

Cavy, kā'vĭ, a small rodent of the family *Caviidæ,* related to the paca and aguti, and characterized by its stout build, short legs, small ears, pink eyes, and total absence of a tail. Cavies are semi-nocturnal animals; feed upon roots and vegetable fare, and are widely distributed throughout the plains and unforested highlands of South America. The only domesticated and familiar species is the much modified guinea-pig (q.v.), which is about eight inches long, and owing to its harmlessness, is a great household pet among children. The largest species of cavy (*C. patchonica*), wrongly called "agouti," is scantily distributed throughout the plains of Argentina. It is rusty red in color, and about the size of a hare, standing on terrier-like legs. The "restless" cavy (*C. porcellus*), and Cutler's cavy (*C. cutleri*), are common in the La Plata valley, and are uniformly colored with grayish-brown or black. Other species are found in Brazil and Bolivia.

Cavies live in burrows of their own digging, and breed twice a year, the number of young varying with the climate. The young are brought forth in a very advanced state of development. Their eyes are open and they are capable of running by the side of their mother in a few hours' time. In less than a fortnight they are quite able to care for themselves. Consult: Hudson, 'Naturalist in La Plata'; and Lydekker, 'Standard Natural History.'

Cawdor, kô'dėr, Scotland, a village in Nairnshire, 5½ miles southwest of Nairn. Cawdor Castle, near by, the seat of the Earl of Cawdor, was founded in 1454, but is one of the three places which tradition has assigned as the scene of King Duncan's murder by Macbeth in 1040. A series of papers from the charter-room at Cawdor was edited (1859) by Cosmos Innes under the title of 'The Book of the Thanes of Cawdor.'

Cawdor, Thane of, in Shakespeare's 'Macbeth,' a character who does not appear upon the stage. On account of his alliance with the Northmen he is condemned to death by Duncan, who calls him "that most disloyal traitor." His title is given to Macbeth, in accordance with the prophecy of the witches. In describing his death it is thought that Shakespeare had reference to the execution of the Earl of Essex.

Cawein, kaw'ĕn, **Madison Julius,** American poet: b. Louisville, Ky., 23 March 1865. His verse is often exceedingly musical and displays great command of metres. Its defects are over ornamentation, and a too profuse employment of adjectives, but the note which he strikes is distinctive and pleasing. He is at his best in his purely Kentuckian poems. His works include: 'Blooms of the Berry' (1887); 'The Triumph of Music' (1888); 'Accolon of Gaul' (1889); 'Lyrics and Idyls' (1890); 'Days and Dreams' (1891); 'Moods and Memories' (1892); 'Intimations of the Beautiful' (1894); 'Poems of Nature and Love' (1893); 'Red Leaves and Roses' (1893); 'Undertones' (1895); 'The Garden of Dreams' (1896); 'Shapes and Shadows' (1898); 'Idyllic Monologues' (1898); 'Myth and Romance' (1899); 'One Day and Another' (1901); 'Weeds by the Wall' (1902).

Cawnpore, kôn-pōr, or **Cawnpur,** kôn-poor', India, capital city of the district of the same name, in the Northwest Provinces, on the right bank of the Ganges, which is here about a mile wide, 130 miles northwest from Allahabad. It is a modern town with nothing specially noteworthy about it as regards site or buildings. There are several churches, a theatre, various military and other offices, high school, club, etc. It manufactures leather and cotton goods, has a large trade, and is an important railway centre. In 1857 the native regiments stationed here mutinied and marched off, placing themselves under the command of the Rajah of Bithur, the notorious Nana Sahib. Gen. Wheeler, the commander of the European forces, defended his position for some days with great gallantry, but, pressed by famine and loss of men, was at length induced to surrender to the rebels on condition of his party being allowed to quit the place uninjured. This was agreed to; but after the European troops, with the women and children, had been embarked in boats on the Ganges, they were treacherously fired on by the rebels; many were killed, and the remainder conveyed back to the city, where the men were massacred and the women and children placed in confinement. The approach of Gen. Havelock to Cawnpore roused the brutal instincts of the Nana, and he ordered his prisoners to be slaughtered, and their bodies to be thrown into a well. The following day he was obliged, by the victorious progress of Havelock, to retreat to Bithur. A memorial has since been erected over the well in the form of an angel with palm branches, and fine public gardens, covering 50 acres, now surround the spot. Including the native city, cantonments, and civil station, it had in 1901 a population of about 197,000.

Caxamarca. See CAJAMARCA.

Caxias, kā-shē-ās', the name of two places in Brazil: (1) A town in the state of Maranhão, on the navigable Itapicuru, 190 miles from its mouth, with an active trade in cotton. Pop. 10,000. (2) An Italian agricultural colony in the Brazilian state of Rio Grande do Sul, founded in 1875. Pop. 13,680.

Caxton, William, first English printer: b. Kent about 1422; d. London 1491. In 1438 he was bound apprentice to Robert Large, a mercer in London, and soon after his master's death (1441) he went to Bruges, where, in 1446, he went into business on his own account. About 1463 he was appointed "governor" at Bruges for the English merchants settled in the Low Countries, a post in which he continued for some years. About 1471 Caxton entered the service of Margaret, Duchess of Burgundy, sister of Edward IV. He had already begun a translation of the popular romance entitled 'Le Recueil des Histoires de Troye,' and this he finished at Cologne in 1471. In order to meet the demand for the book he learned the art of printing, probably at Cologne, and his 'Recuyell of the Histories of Troy,' the first English printed book, appeared about 1474, having issued, it is supposed, from the press of Colard Mansion at Bruges. His 'Game and Playe of the Chesse,' also a translation from the French, was probably a production of the same press in 1475, and is the second English book printed. He left Bruges in 1476, returned to England, and in 1477 had a press at Westminster Abbey, where he printed the 'Dictes and Sayings of the Philosophers,' the first typographical work executed in England. Caxton continued to exercise his art for about 14 years, during which time he produced nearly 80 works, many of them translated by himself from the French, and one of them — 'Reynard the Fox'— from the Dutch. He was patronized by Edward IV., Richard III., and Henry VII.; and he was on intimate terms with Earl Rivers, the Earl of Worcester, and others of the nobility, the two noblemen named having even translated works for his press. He was buried in the Church of St. Margaret's, Westminster. Besides the books already mentioned, Caxton printed Chaucer's 'Canterbury Tales'; 'Troylus and Creside'; 'Book of Fame,' and translation of Boethius; Gower's 'Confessio Amantis'; works by Lydgate; Malory's 'King Arthur'; 'The Golden Legend'; 'The Fables of Æsop,' etc. His books have

no title pages, but are frequently provided with prologues and colophons. His types are in the Gothic character, and copied so closely from the handwriting of his time that many of his books have been mistaken for manuscript. In some no punctuation is used; in others the full point and colon only; commas are represented by a long or short upright line. Copies of some of his books now bring extraordinary prices when sold. The standard 'Life of Caxton' is that by W. Blades (1861–3).

Caxtons, The, a novel by Edward Bulwer, Lord Lytton, published in 1850. 'The Caxtons' was not only instantly popular in England, but 35,000 copies were sold in America within three years after its publication in 1850. Never before had Bulwer written with so light a touch and so gentle a humor, and this novel has been called the most brilliant and attractive of his productions. His gentle satire of certain phases of political life was founded, doubtless, on actual experience.

Cayambe'-Urcu, kā-yām-bā'-oor'koo, or **Cayambe',** a summit of the Colombian Andes, lying directly under the equator in Ecuador. It rises in the shape of a beautiful and regular cone to a height of 19,187 feet. Its top is crowned with perpetual snow, and its geographical position and great elevation render it one of the most remarkable mountains of the world.

Cayenne, kā-yĕn' or kī-ĕn', French Guiana, a city and capital of the colony, situated in lat. 4° 56′ N., lon. 52° 20′ W. The first casual occupants were the Dutch, at the beginning of the 17th century. The French, under Charles Poncet, settling here, as well as at other points on the Guiana coast, 20 years later, were driven out by the natives, but undertook another expedition in 1643. Again unsuccessful, they made a third futile effort in 1652; then they deserted the town. The Dutch re-occupied it, but were obliged to surrender possession to a new French expedition. After the Treaty of Breda the Dutch once more took Cayenne, and were attacked there by the French in 1676. The French settlement was permanently established at the beginning of the 18th century. Present population, about 10,000, of whom more than half are convicts, including the negroes, Anamites, and Arabs, transported for crimes committed in the French, African and Asiatic colonies. White criminals have in recent years been sent elsewhere, as a rule, but Alfred Dreyfus, captain in the French army, after his conviction of treason in December 1894, was condemned to solitary confinement on the Ile du Diable, a remote outpost of the Cayenne penal settlement (27 miles away, off the northwest coast), and there remained until taken back to France for a new trial. The climate of the capital, which is built on an island east of the mouth of the Cayenne River, is rendered exceedingly unwholesome by the low and swampy character of a part of the neighboring coast. The harbor is shallow, yet the products of the country — gold, sugar, molasses, rum, coffee, hides, spices, cocoa, etc. — are shipped in considerable quantities each year. The recent discovery of diamonds (1900–3) in the interior of the Guianas suggests a possible development of trade, and a better use of American territory in the future. See GUIANA.

Cayenne Pepper, or **Capsicum,** a powder formed of the dried and ground fruits, and more especially the seeds, of various species of *Capsicum,* and especially of *C. frutescens.* It is employed as a condiment to improve the flavor of food, aid digestion, and prevent flatulence. In medicine it is used as a stimulant, and is a valuable gargle for a relaxed throat. See CAPSICUM.

Cayes, kā, Les. See AUX CAYES.

Cayley, kā'lī, **Arthur,** English mathematician: b. Richmond, Surrey, 16 Aug. 1821; d. London 26 Jan. 1895. He received his early education at Blackheath and King's College, London, passing subsequently to Trinity College, Cambridge. Called to the bar in 1849, he practised for some years as a conveyancer, but in 1863 was appointed first Sadlerian professor of pure mathematics at Cambridge. Trinity College in 1875 accorded him the rare honor of electing him a Foundation Fellow. He received many distinctions from universities and learned societies both at home and abroad, and in 1883 he presided over the meeting of the British Association at Southport. He seldom identified himself with movements outside his own immediate work, but took a prominent part in the agitation for the higher education of women, which resulted in the foundation of Newnham College. As a mathematician he was characterized by the wide scope and originality of his work. His chief memoirs deal with differential equations, elliptic functions, and determinants. His 'Elementary Treatise on Elliptic Functions' appeared in 1876, and 'Single and Double Theta-functions' in 1881; and in 1889, a collected edition of his papers began to be issued, extending over a number of volumes. In 1882 he lectured in Johns Hopkins University, Baltimore.

Cayley, SIR **George,** English scientist: b. Brompton, Yorkshire, 1773; d. 15 Dec. 1857. His genius first displayed itself in the analysis of the mechanical properties of air under chemical and physical action. His papers on the subject gave rise to many experiments on the navigation of balloons at home and abroad. His experiments on the steam engine led to his invention of the air engine. His discoveries in optics were followed by the invention of an instrument for testing the purity of water by the abstraction of light. He was also the inventor of an ingenious arrangement for obtaining and applying electric power to machinery. He was one of the original promoters of the polytechnic institution at London. Toward the end of the 19th century he applied to his extensive estates in Yorkshire a new system of arterial drainage. He was also the father of the cottage allotment system. As a politician, he took a prominent part in the election of liberal members of Parliament, and the return of Brougham was chiefly due to his sympathy with the reform bill. Upon the passing of that bill he was himself chosen as member for Scarborough, but on account of his advanced age, soon retired.

Cayleyan, kā'lē-an, in mathematics, the name for a family of curves investigated by Prof. Cayley, of Cambridge, and by him called pippians. The Cayleyan is of the sixth order, and is exhibited as the envelope of right lines, considered in couples, which are polar conics of the general curve of the third order. In Cayley's

notation, if the cubic is $U=(*)(x, y, z)^3=0$ then $PU=0$ is the Cayleyan. See Cayley, 'Collected Mathematical Papers,' Vol. I., p. 183, and Vol. II., p. 381.

Caylus, Anne Claude Philippe de Tubières, ăn klōd fē-lēp dė tü-bē-ār kā-lüs, COUNT OF, French archæologist: b. Paris 31 Oct. 1692; d. there 5 Sept. 1765. He was a son of the Marquise de Caylus (q.v.), and after having served in the army during the war of the Spanish succession, he left the service in 1715, accompanied Bonac on his embassy to Constantinople the following year, and visited Greece, Troy, Ephesus, Byzantium, and Adrianople. In 1717 he returned to Paris, and began the arrangement of his extensive collections. He commenced a great work on Egyptian, Grecian, Etruscan, Roman, and Gallic antiquities, with numerous plates. He was a member of the Academy of Painting and of the Academy of Inscriptions, and divided his labors between them. He made a chemical examination of the ancient method of encaustic painting, investigated the mode of painting on marble, the art of hardening copper, the mode by which the Egyptians raised great weights, the mummies, painting on wax, and many other subjects. Integrity, simplicity, and disinterestedness were united in his character, with occasional traits of dogmatism. He has left numerous works, tales as well as antiquarian researches. Among the latter is his 'Recueil d'Antiquités Égyptiennes' (1752-67, 7 vols.). Caylus was also an industrious and skilful engraver, and produced a collection of more than 200 engravings, after drawings in the royal cabinet, and a great number of heads, after the first masters.

Caylus, Marthe Marguerite de Villette, mär-tė mär gėr ēt dė vēl-ĕt, MARQUISE DE, French writer of memoirs: b. Poitou 1673; d. Paris (?) 15 April 1729. Long an ornament of the brilliant court of Louis XIV., she passed her declining years in dictating 'My Recollections,' in which a valuable insight into the life of Louis XIV. is afforded, through the medium of a singularly happy style.

Cayman, kā-măn, or **Caiman,** kā-ē'măn, any of five species of alligators inhabiting the fresh waters of Central and South America. The caymans are distinguished from other alligators in having an armor of overlapping bony scutes protecting the belly, as well as an armor of bony plates on the back. The black cayman (*Caiman niger*) of tropical South America east of the Andes is the largest species, reaching a length of 13 feet. In some of the rivers of South America caymans are found in vast numbers and are said to be extremely voracious.

Cay'mans, The, or **Cayman Islands,** three islands situated in the Caribbean Sea, about 140 miles northwest of Jamaica, of which they are dependencies. Grand Cayman, the largest of the three, is 17 miles long, and from 4 to 7 broad. It is well wooded. The natives are chiefly employed in agricultural operations or in trading with Jamaica and other places. They cultivate sugarcane and vegetables, and raise cattle, pigs, poultry, etc. Turtle and cocoa-nuts are exported. The climate is very healthful. There are several Presbyterian places of worship. A large proportion of the inhabitants are whites. Pop. about 2,500. Cayman Brac has about 500 inhabitants, mostly white, Little Cayman, 40 or 50, all white.

Cayuga (kā-yoo'gā) **Lake,** a lake in the State of New York, on the boundary of Cayuga and Seneca counties, and extending south into Tompkins County, 38 miles long and from 1 to 3½ miles wide. It is much frequented by pleasure parties. The town of Ithaca stands at the southern extremity of the lake.

Cayu'gas ("swamp-dwellers," possibly in reference to their cranberry swamps) a tribe of North American Indians, forming the smallest of the original Five Nations of the Iroquois, and according to Onondaga tradition, the last to join the confederacy; whence it was called "The Youngest Brother." The tribe was not inferior in energy and original genius, however; several of the chiefs were men of superior ability, as Karistagea, or Steeltrap; and Tahgahjute, or "Logan," the son of one of its sachems. The latter will be ever remembered, not only for the pathetic speech attributed to him, but for his high personal qualities. Nor were the Cayugas inferior in fighting prowess: in one of their Virginia campaigns they seem to have destroyed the tribe of Tuteloes, and incorporated with their own tribe the remnant who were not slain. They were friendly to the whites, however, and bore a good reputation. They were located along the Cayuga Lake in central New York, and in the valley of its outlet, the Seneca River. At the outbreak of the Revolution, they joined the Mohawks and Senecas in alliance with the British against the Americans, and shared in the devastation of the property of the patriots during Sullivan's campaign; the most of them settled in Canada with the other Iroquois, 200 remaining in New York, apparently around Niagara. In 1789 they made their first formal cession of territory to the whites, confirming it by a treaty at Fort Stanwix in 1790; in 1795, by a treaty at Cayuga Bridge, they ceded their great reserve in the lake basin and the river valley, retaining only one of four miles square. For these releases they received large money annuities, which they used largely for liquor. In 1806 all the remainder left the reservation and emigrated westward or northward; some joining their brethren in Canada, some going to Sandusky, Ohio, others settling among the Senecas near Buffalo. There are at present about 1,300 in all, the bulk of them at the Six Nations on Grand River, Ontario, some with the Oneidas in Wisconsin, about 170 with the Senecas in New York State, and others with the Senecas in Indian Territory.

Cayuse, kā-yoos', **Cailloux,** or **Willetpoo,** a tribe of North American Indians who formerly inhabited the region between the Des Chutes River and the Blue Mountains, Oregon, and also parts of Washington, south of the Yakima River. There are now only about 415 persons, presumably of Cayuse blood, on the Umatilla reservation.

Cay'van, Georgia, American actress: b. Bath, Maine, 1858. She went on the stage early in life and won note as Dolly Dutton in 'Hazel Kirke.' She was afterward with A. M. Palmer and Daniel Frohman. She became leading lady of the Lyceum Theatre Stock Company in 1897, retiring from the stage soon afterward.

Cay'zer, Charles William (CHARLES WHITWORTH WYNNE), English shipowner and poet: b. Bombay 19 July 1869. He was educated at Rugby and Christ Church, Oxford, and has published 'Ad Astra' (1900), a very extensively advertised volume; 'Songs and Lyrics' (1900); 'King David' (1902).

Cazal, Manuel Ayres de, mä'noo-ĕl ī'rĕz dā kä-zäl', Portuguese historian: b. 1754; d. about 1821. He was for a long period prior at Crato, Goyaz, Brazil, devoting himself to historical and geographical research, publishing in 1817, 'Corographia Brasilica, on relaçao historica-geographica do reino do Brazil,' a much valued work.

Cazalès, Jean Antoine Marie de, zhŏn äṅ-twäṅ mä-rē dė kä-zä-lās, French politician: b. Grenade, Haute-Garonne, France, 1 Feb. 1758; d. Engalin, Gers, France, 24 Nov. 1805. The son of a counselor of the Toulouse parliament, he served for some time in Jarnac's regiment of dragoons. Being chosen in 1789 a deputy of the noblesse to the States-General, he became one of the most able and eloquent opponents of the Revolution, but was treated with ingratitude by the royalists, although he had labored and suffered much in their cause, and barely escaped being put to death. Having traveled abroad during the reign of terror, he returned to France in 1801. Napoleon conferred on him, although he had refused to enter his service, the cross of the Legion of Honor. His 'Discours et opinions' and his 'Défense de Louis XVI.' were published in 1821.

Cazalla de la Sierra, kä-thäl'yä dā la sē-ĕr'rä, Spain, a town in the province of Seville, and 36 miles northeast of the city of Seville, on a declivity of the Sierra Morena. Its streets are clean, paved, and well arranged; and it has two squares, in the principal of which are the ancient church and town-hall. The mountains in the vicinity are rich in metals. Pop. about 9,000.

Cazauran, kä'zō-răn, **Augustus R.,** Franco-American author and playwright: b. Bordeaux, France, 31 Oct. 1820; d. New York 27 Jan. 1889. He was educated at the University of Dublin. In 1848 he became implicated in an Irish rebellion, fled to the United States and obtained employment as a reporter. During the Crimean war he acted as war correspondent to a London daily. Afterward he was connected with the Cincinnati *Enquirer* and became chief editor of the Memphis *Argus*. When Lincoln was shot he was at the theatre as dramatic critic, and wrote the first account of the assassination. In 1869 he went to New York, did dramatic work, and gathered about him a remarkable company of artists. He adapted 'Miss Multon,' 'The Danicheffs,' 'Man of Success,' 'The Mother's Secret,' 'Lillian's Lost Love,' 'The Banker's Daughter,' 'The Celebrated Case,' 'Lost Children,' 'French Flats,' 'Mother and Son,' 'Felicia,' 'The Creole,' 'Daniel Rochat,' 'A Parisian Romance,' and 'The Ranzar.'

Cazembe, kä-zĕm'bĕ, or **Cazembe's Dominion,** Africa, a region formerly constituting a large and well-ordered negro state lying south and southwest of Lake Tanganyika, and taking its name from the title of the sovereign. The country forms a kind of basin, bounded on the east by a plateau which rises to the height of from 3,000 to 4,000 feet; on the west, also, it is bounded by a series of heights. On the south it has the lofty watershed which separates its streams from those of the Zambesi River system. Its principal stream is the Chambezi, which flows westward into Lake Bangweolo, then northward, under the name of the Luapula, into Lake Moero. The ruler, or muata, used to be feared as a great magician; he had over 600 wives, and maintained a well-armed body of troops, numbering at one time, it is said, 20,000. His dominions were divided into districts, each of which had a governor of its own. These governors and other men of rank formed a body of privileged nobility; all the rest of the inhabitants, farmers, artisans, etc., were looked upon as slaves of the ruler. The population consisted of a ruling race, the Campololos, who had invaded and conquered the country, and the Messiras, the original inhabitants. It was only Campololos that received official posts, and the Campololo language was the one spoken at court. The people were industrious agriculturists, growing crops of mandioc, maize, sorghum, etc. They manufactured coarse cloths, cords, nets, lines, etc., from cotton and the fibres of certain plants; made weapons and implements of iron; also earthenware, wooden vessels, etc. Cazembe was visited by Lacerda in 1799, and by other Portuguese explorers in 1831. Dr. Livingstone, in 1867, stayed 40 days at the capital, which he found to consist of a number of huts dotted over a large area, and having probably not more than a thousand inhabitants. The Cazembe at this time was a usurper, whose cruelties had done much to depopulate the country, and it was doubtful if he could bring a thousand warriors into the field. The country, which had been ravaged by the slave trade, now belongs partly to the British sphere of influence, partly to the Congo State.

Cazin, Jean Charles, zhŏn shärl kä-zăn, French artist: b. Samer, Pasde-Calais, about 1840. He studied under Le Coqu de Boishaudran, obtained a first-class medal at the Salon in 1882 and was made an officer of the Legion of Honor 1889. He is best known as a landscape painter, although frequently introducing figures into his paintings. His coloring and sentiment are much admired.

Cazorla, kä-thôr'lä, Spain, a town in the province of Jaen and 41 miles east of the city of Jaen. It rises in the form of an amphitheatre on the slope of the Sierra de Cazorla, and is well built, though much less important and populous than in the time of the Moors, during whose wars it held an important position. The Sierra de Cazorla is a wooded ridge round which winds the upper course of the Guadalquivir. Pop. about 6,000.

Cazot, Théodore Joseph Jacques, tā-ō-dôr zhō-zĕf zhäk kä-zō, French politician: b. Alais 11 Feb. 1821. In 1848 he was active as a Republican in his home department; in 1870 he was appointed general secretary in the ministry of the interior; in 1871 elected to the National Assembly; and in 1875 was made life senator. From 1879–82 he was minister of justice and was interested in bringing about a reform in the appointment of judges, but retired without passing the law he desired. In 1883 he was president of the court of cassation, resigning in 1884 on account of being implicated in fraudulent dealings.

Cazotte, Jacques, zhāk kā zŏt, French poet: b. Dijon 1720; d. 25 Sept. 1792. His masterpieces are: 'Oliver' (1762), a poem of chivalry after the manner of Ariosto; and 'The Devil in Love' (1772), a tale of wonder, still a popular favorite. He had extraordinary skill in versifying, as shown by his adding a seventh canto to Voltaire's 'Civil War of Geneva' with such perfect imitation of Voltaire's style and manner as to deceive all Paris.

Cazwini, käz-wē'nē, Zacharia Ben Mohammed, Arabian naturalist: b. Cazwin, Persia, 1212; d. 7 Aug. 1283. He was descended from a family of lawyers, who derived their origin from Anas Ben Malek, a companion of Mohammed, and had settled in Cazwin, a city in Persia. From that place this author received the surname under which he has become celebrated. Of the circumstances of his life we know little more than that he was cadi of Wazith and Hillah, and died in the year of the Hegira 682 (1283 A.D.). His most important work is on natural history — 'The Wonders of Nature and the Peculiarities of Creation' — of which Ideler, professor in the University of Berlin, published the chapter on the 'Constellations of the Arabians,' and of which there are fragments in Bochart's 'Hierozoikon,' in Ouseley's 'Oriental Collections,' and in Wahl's, Jahn's, and De Sacy's 'Arabic Chrestomathies.' It was the object of Cazwini, like Pliny, to describe the wonders of all nature. His work contains a comprehensive view of all that had been written before him, but in so grand and original a manner that it is of higher value than most of the original works which treat of the same subjects. There is an abridged translation of it in the Persian.

Cean-Bermudez, Juan Agustin, hoo-ān' ā-goos'tīn thā-ān' bĕr-moo'dāth, Spanish archæologist: b. Gijen, Asturia, 17 Sept. 1749; d. Madrid 3 Dec. 1829. He devoted himself early to the study of the fine arts, into which he was initiated by Raphael Mengs. After holding a public office at Madrid, he retired to Seville, where he founded an academy of fine arts, and occupied himself with the study of their history. He was elected a member of the royal academies of history and fine arts at Madrid, and published several valuable works connected with his favorite pursuits. His most important book, entitled 'Sumarie de las antiguedades romanas que hayen España,' appeared posthumously in 1832.

Ceano'thus, a genus of shrubs and small trees of the natural order *Rhamnaceæ*. There are about 35 species, natives of the Pacific coast region of North America. They are characterized by serrate or entire simple leaves; small, perfect, white, purplish, or blue flowers in showy clusters, which are often panicled; and three-celled drupaceous fruits, which, on drying, separate into three stones. Many of the species and their hybrids are popular ornamental shrubs, especially in mild regions, their free-blooming habit rendering them specially useful as lawn specimens. Three species, *C. americanus, C. ovatus,* and *C. fendleri,* and some of their hybrids, are hardy in the north, but usually the hybrids must either be protected from frost or stored over winter in a plant-pit or frost-proof cellar. They succeed in almost any soil, but do best in light, well-drained loams, especially when exposed to the sun. Propagation is easily effected by seeds, cuttings, or layers, *C. americanus,* known as New Jersey tea and red-root, is common from Canada to the Gulf States. Its leaves are said to be used as a substitute for tea, a use to which they are reported to have been put during the American Revolutionary war.

In medicine ceanothus has not been used to any great extent. Its roots contain from 6 to 10 per cent of tannin, and have been used in domestic medicine as astringents. Owing to the close resemblance of the roots, ceanothus has been used as an adulterant for rhatany.

Ceará, sā-ā-rā', Brazil, a state bounded on the north and east by the Atlantic Ocean and Rio Grande do Norte, on the south by Parahyba and Pernambuco, and on the west by Piauhy. Its area is 40,250 square miles, and its population 881,686. The principal port and capital of the state is Fortaleza (q.v.), which is regarded as one of the most beautiful cities of Brazil. A railroad connects Fortaleza with Baturité. The principal exports of Ceará (statistics of 1899) are: rubber, cattle, cotton, hides, mules, preserved fruits, and hammocks. Coffee, sugar, wine of the cashew nut, oranges, and wax are also produced. The estimated value of all the exports is about $5,000,000 annually, in which amount the United States shares to the extent of nearly one third. Ceará is divided into 27 comarcas, or counties. The most fertile and populous district is the upper Jaguaribe.

Ceará-mirim, a city in Brazil. Pop. 18,000.

Ceballos, José, hō-sā' thā-bāl'yōs, Mexican soldier: b. Durango 15 March 1830. In 1869 he had command of a regiment in the province of Yucatan; while here a portion of his soldiers revolted, but he suppressed the insurrection in three days; he also executed without authority several private citizens who were implicated in the revolt. In 1870 he was made brigadier-general and given command in the western states, where he had charge of the campaign against the bandit chief, Losada. When Lerdo de Tejada became president of Mexico, Ceballos was put in command of the force sent to depose Camerana, the governor of Jalisco. After a severe struggle between the state and government forces, Caballos was successful and became governor, a position which he held till 1876. At that time Tejada was deposed by Diaz; Ceballos joined with Iglesias, but was forced to leave Mexico for a time. He went first to California, then to Guatemala, where he was appointed director of a military school. Though at first plotting a revolution against Diaz he suddenly turned to his support, returned to Mexico, was restored to his rank, and made governor of the federal district. He has been a bitter enemy of the press, and in 1885–6 had a number of students and journalists arrested.

Ce'bes, of Thebes, Greek philosopher, a disciple and friend of Socrates, and the reputed author of the 'Pinax,' or «votive tablet,» a philosophical dialogue representing allegorically the temptations of this life and teaching that true learning can alone make for happiness. In spite of its pure Attic, and its truly Socratic tendency, modern criticism now assigns the work to the 2d century A.D. It was extremely popular in

the Middle Ages, a sort of 'Pilgrim's Progress,' indeed; was translated into all the languages of Europe, as well as Arabic, which latter version, made possibly in the 9th century, is our sole record of the close of the dialogue. Modern editions are those of Drosihn (1871); Kraus, (1882); Parsons (1887).

Cebidæ, sĕb'ĭ-dē, a family of American monkeys, including the howler, saki, sapajou, spider-monkey (qq.v.), etc. See also MONKEY.

Cebu, thā-boo' or sĕ-boo', Philippines, an island lying between Negros and Bohol, north of Mindanao. Its length northeast and southwest is 139 miles; width, 24 miles; area, 1,668 square miles. It has a mountain system consisting of a chain running the length of the island, nearer the east than the west coast. The mountains are not over 2,200 feet high, but their ascent is steep and it is difficult to cross them. There are six passes, the best being the southernmost, from Sibonga to Dumanjug, over which United States army officers constructed a temporary wagon road in the summer of 1900. The chief products are rice, chocolate, sugar, and coffee. There are manufactures of hemp and piña cloth, sugar-sacks, cocoanut wine, sugar, salt, and cheese. In 1827 coal was discovered in Cebu, the first found in the Philippines. It is of good grade, adapted to general use. The trade of the island is extensive. Besides the mountain passes there are two main highways, one on the east coast, and one on the west coast, while the port of Cebu has communication with Manila and the islands of the Visayan group. Cebu was first occupied by United States troops in February 1899. Operations against the insurgents resulted in driving them from their position, and capturing a large quantity of material of war. This island, with a few dependent islands, forms the province of Cebu, in which civil government was created under the provincial government act of 1901. At that time several of the cities had organized their municipal governments according to the code of the Philippine commission. Though the province was restored to military government for a time in 1901, civil government was permanently resumed in January 1902. Pop. (province) 518,000.

Cebu, Philippines, capital of Cebu province, situated on the east coast of the island of Cebu. The streets are wide and regularly laid out. There is a cathedral in one of the suburbs, and it has also several other churches and an Episcopal palace. Cebu is an important port with an extensive trade. It is the oldest Spanish settlement in the Philippines. In the "Rizal," a building in front of the Santo Nino Church, is the cross which it is said was planted near the town by Magellan when he took possession of the island. An old fort built by the Spaniards stands within the limits of the town. Pop. 35,243.

Cecchi, Giammaria, jäm-mä-rē'ä chĕk'kē, Italian dramatist: b. Florence 14 April 1518; d. there 28 Oct. 1587. He was the rival of Bibbiena, Machiavelli, and Ariosto in portraiture of character and in liveliness of dialogue. Of his plays, 95 in number, but few have been printed. These are mainly imitations of Plautus and Terence; the best of them are: 'The Hammer'; 'The Slave'; and, the most famous of all, 'The Owl.' He wrote also religious dramas; among them 'The Exaltation of the Holy Cross' (1580).

Cecco d'Ascoli, chĕk'kō dās'kō-lē, properly Francesco Stabili, Italian poet: b. Ascoli about 1257; d. Florence 16 Sept. 1327. He was a devoted student of astrology and of demonology. For the expression and defense of certain erroneous opinions he was burned at the stake. His heretical or impious doctrines are contained in a poem, unfinished but of encyclopædic compass, 'Bitternesses,' of which he lived to complete four books. The subject of the first book was astronomy with meteorology; of the second, stellar influence with physiognomy; of the third, minerals; of the fourth, sundry problems, moral and physical.

Cech, chĕk, **Sva'topluk,** Czech writer: b. Ostredek 21 Feb. 1846. He was editor in succession of several journals, and at the same time practised law. After winning some celebrity as a writer of stories and short poems, he made a bolder flight in 1872 with 'Dreams,' in which he shows great epic power. Besides this he has written several other poems, as 'The Adamites'; 'The Storm'; 'Songs of Morning.' He is the most popular of Czech poets. As a novelist he excels in lively wit and rich humor. Among his works of prose fiction may be named: 'Stories, Arabesques, and Humoresques'; and the amusing 'Candidate for Immortality.' He has written also 'Memories from the Orient' (1885), as well as later volumes.

Cecidomyia, sĕs-ĭ-dō-mī'ya, a genus of two-winged flies, of the family *Cecidomyiidæ,* the gall-gnats (q.v.).

Cecil, sĕs'ĭl or sĭs'ĭl, **Evelyn,** English writer: b. 1865. He was educated at Eton and New College, Oxford, studied law and became a barrister of the Inner Temple. He was a private secretary to the Marquis of Salisbury, 1895–1902, and sat in the House of Commons as member for East Herts, 1898–1900. He was the last Englishman who conferred with Presidents Kruger and Stein prior to the beginning of the Transvaal war in 1899. He has published 'Primogeniture: a Short History of its Development in Various Countries and Its Practical Effects' (1895); 'On the Eve of the War' (1900).

Cecil, Robert, Earl of Salisbury, English statesman, second son of William Cecil, Lord Burleigh (q.v.): b. about 1563; d. Marlborough, Wiltshire, 24 May 1612. Having received the honor of knighthood he went to France as assistant to the English ambassador. On the death of Sir Francis Walsingham he succeeded him as principal secretary, and continued to be a confidential minister of Queen Elizabeth to the end of her reign. Having secretly supported the interests of James I. previous to his accession to the crown he was continued in office under the new sovereign and raised to the peerage. In 1603 he was created a baron, in 1604 Viscount Cranbourn, and in 1605 Earl of Salisbury. In 1608 he was made lord high treasurer, an office which he held till his death.

Cecil, William, LORD BURLEIGH. See BURLEIGH.

Cecil Dreeme, a novel by Theodore Winthrop, published in 1862. By its brilliancy of style, crisp dialogue, sharp characterization, and ingenuity of structure, it won an immediate popularity.

Cecil'ia, Saint, Christian virgin and martyr; her day in the Roman calendar is 22 November. Her story as recounted in the 'Breviarium Romanum,' represents her as a Roman lady of noble birth, a Christian from childhood, and from her early years vowed to virginity. Yet her parents gave her in marriage to a young noble, Valerianus, whom Cecilia persuaded not only to respect her vow, but also to become a Christian; and he, converted, induced also his brother, Tiburtius, and their intimate friend, Maximus, to enter Christ's fold; shortly after these three suffered martyrdom together. Cecilia now, in anticipation of the same fate or the same crown, distributed her possessions among the poor, and this becoming known to the prefect of Rome he ordered her to be taken to his own mansion and there burned to death in the bath (*in balnes*). But the virgin, exposed to the flames for a day and a night, was found unhurt; and after the axe of the headsman had also failed to sever her head from her body, at last she won the double wreath of virginity and martyrdom; this was in the reign of Alexander Severus and in the pontificate of Urban I., about the year 230. Urban erected a church in her house which was called by her name. The Church of St. Cecilia is still one of the most notable churches of Rome, having been again and again repaired or reconstructed. In this account of Saint Cecilia nothing is said of the musical accomplishments of the virgin, but legend makes much of them; hence, Saint Cecilia is the patron saint of music and musicians, and musical societies are very commonly called by her name: Dryden's fine ode, 'Alexander's Feast: a Song for Saint Cecilia's Day,' is an imperishable monument of the Cecilian legend in English literature.

Cecilia, a novel by Frances Burney, published in 1782. It is a typical English novel of a century ago. The plot is simple, the story long drawn out, the style stilted, and the characters alone constitute the interest of the book, and justify Dr. Johnson's praise of Miss Burney as "a little character-monger."

Cecomorphæ, sē-kō-môr'fē, one of Huxley's groups of schizognathous birds, now generally ranked as a sub-order or order, or split up in various ways among several orders. The palate has a narrow cleft on each side of the vomer, running the entire length between this bone and the palatines; the nostrils are usually narrow slits, but are sometimes tubular; the feet are always webbed, with three toes directed forward and the hallux small or wanting, and never connected to the other toes by a web. The *Cecomorphæ* are all aquatic birds, and may be subdivided into the *Pygopodes* or divers, and the *Longipennes* or long-winged swimmers. The former includes the following important families: *Alcidæ,* the auks, puffins, and guillemots (qq.v.); *Podicipedidæ* (q.v.), the grebes; *Heliornithidæ,* the sun-birds (q.v.); and *Colymbidæ,* the divers (q.v.). The *Longipennes* group includes two families, the *Procellariidæ* or petrels, albatrosses, and shearwaters (qq.v.); and the *Laridæ,* or gulls, terns, and skimmers (qq.v.).

Cecro'pia, a genus of plants of the order *Artocarpaceæ,* of which the best known species is the trumpet-tree (*C. peltata*) of the West Indies and tropical South America. It attains a height of about 50 feet, and has a hollow stem and branches, from which musical instruments are made. Its leaves are very large, circular, and peltate, and serve as food for sloths; and its flowers are small and grouped in short spikes, several of which are enclosed at first in a large bract. The wood is light and soft, and is employed by the natives in various ways, particularly for the purpose of obtaining fire by friction. Ropes are made from the inner bark, and the outer bark has astringent properties. Caoutchouc is obtained from the juice, and the buds are employed as a pot-herb. Ants utilize the hollow stems as dwellings.

Cecropia Moth, a colossal species (*Samia cecropia*) of the family *Saturniidæ.* The moth expands five or six inches and is brick-red in color, the wings tinged with grizzly, each wing with a large crescent-shaped spot near the centre, which is red and white, or white-edged with red and black; on the apex of each fore wing is a large, black, eye-like spot. The caterpillar is a large green worm three to four inches in length, protected by large tubercles colored green, blue, yellow, or red. It is not uncommon on the elder, willow, apple, currant, pear, thorn, poplar, etc. At the end of summer it spins a large cocoon, open at one end,—not oval, as in those of *Telea polyphemus* and the luna moth,—and attaches it to a branch of a tree. An allied species in northern Maine and Canada is *S. columbia,* while in the Rocky Mountain region, Colorado and Wyoming it is represented by *S. gloveri,* and on the Pacific coast by *S. californica.* The silk of this species cannot be used because its fibres are not continuous.

Cecrops, sē'krŏps, according to Greek tradition, the founder of Athens, and the first king of Attica. He was said to have been an autochthon (sprung from the soil), and was sometimes represented as half man, half dragon. He taught the savage inhabitants religion and morals, made them acquainted with the advantages of social life, and laid the foundation of the future city of Athens, which after him was originally called Cecropia. He is also said to have introduced the art of ship-building. He died after a reign of 50 years. By the later Greeks he was represented as having led a colony to Attica from Sais in Egypt about 1400 or 1500 B.C., but the best modern critics do not look upon this event, nor on the life of Cecrops at all as historical. There is no doubt that Egypt did have a certain influence on the development of civilization in Greece, but how great this influence was, or in what manner exercised, history does not furnish sufficient data to enable us to decide. It is probable that the true Cecrops was a hero of the Pelasgian race.

Cedar, various cone-bearing evergreen trees and their wood; also several non-coniferous trees. The most widely known are probably the cedar of Lebanon (*Cedrus libani*), the deodar, or goa-tree, of India (*C. deodara*), and the African or Mount Atlas cedar (*C. atlantica*). These three species are regarded by some botanists as mere varieties of the first-named species. They are large ornamental evergreen trees with wide spreading branches which give

them a form distinct from most other cone-bearing trees. They are sometimes planted in southern California and the Gulf States, and the last-mentioned species even as far north as Philadelphia, where it can stand the winter in sheltered situations. They are readily propagated by seeds, and thrive well in well-drained loamy soil. From ancient times their odorous, light-red wood has been used for fine furniture and interior house-finish. The white gum of the cedar of Lebanon, which oozes from the trunk and branches, was formerly employed in embalming, but the forests of this tree have become so much reduced that neither the resin nor the oil made from it are in commerce. The other species are most abundant, the deodar in India and the Atlas cedar in northern Africa. Their timber is widely used for fine cabinet work.

The red cedar (*Juniperus virginiana*) is a well-known very variable tree found from Canada to Florida, and westward to the eastern slope of the Rocky Mountains. It attains a height of about 100 feet; has a conical more or less spreading head with upright limbs; evergreen, spiny, pointed leaves, and brownish or bluish globular fruits covered with bloom. The wood is largely used for fence-posts. The white cedar (*Thuja occidentalis*) is also a well-known American tree found in wet ground from Maine to Florida, and westward to the Mississippi River. It attains a height of 70 to 80 feet; has erect spreading branches; thin and slender pendulous twigs; fragrant, glaucous, green leaves; and tiny bluish-purple cones covered with bloom. The trees are highly ornamental, and, being hardy, are general favorites in the north. The wood is especially useful in moist places. The name white cedar is often applied to the *Arbor vitæ*. The yellow cedar (*Cupressus nootkatensis*), a common tree on the Pacific coast from California to Alaska, is valued, in cabinet work and interior house-finishing, for its light-yellow wood, which takes a high polish. Like its relative mentioned above, it is often planted for ornament. In its home it often exceeds 100 feet in height. The best known non-coniferous trees that are sometimes called cedar are probably *Cedrela odorata* (see CEDAR, BARBADOES) and *Cedrela toona*, the Australian cedar. See TOONA; JUNIPER.

Cedar, Barbadoes, a tall tree (*Cedrela odorata*) of the natural order *Meliaceæ*. It is a native of the West Indies, where its wood is highly valued for making certain kinds of furniture, cigar-boxes, canoes, and shingles. It is also exported for the manufacture of lead pencils. It often attains a height exceeding 75 feet and a great girth. It bears pinnate leaves 10 to 20 inches long; pendulous terminal panicles of inconspicuous whitish flowers, followed by dehiscent fruits about half an inch in diameter, containing numerous flat-winged seeds. The bark, leaves, and fruits smell like assafœtida, but the wood is pleasantly fragrant. The tree is often planted for its ornamental qualities, especially along avenues. It thrives in southern California and in the Gulf States. Several of its relatives, especially *C. sinensis*, which is hardy as far north as Philadelphia, are also similarly used. See TOONA.

Cedar-apples, fungous outgrowths upon juniper and red cedar trees. They are caused by the parasitic fungus *Gymnosporangium macropus*. At first they appear like warts upon the smaller branches and twigs, becoming chocolate color or brown as autumn advances, and remaining attached and unchanged until spring, when they enlarge into horn-shaped, jelly-like masses that resemble sponge. At this time they produce their abundant spores which, as the masses become dry, are blown away by the wind and, alighting on apple-trees, produce rust on the foliage and other green parts. They will not germinate upon cedar or juniper, but require an alternate host, the apple, to complete their life cycle. For methods of control see APPLE (*Diseases*); FUNGICIDE.

Cedar-bird, the common American waxwing (*Ampelis cedrorum*), a bird found throughout North America, breeding from the latitude of Kentucky northward. In most localities it is only partially migratory. It is a beautiful bird of delicate unobtrusive colors, generally ashy-brown with a purple tint on the head, the front of which, like the throat, is black. The tail-feathers are tipped with yellow, and the wings are crossed by a white bar, below which are the peculiar red sealing-wax-like appendages. The head is gracefully crested. The cedar-birds spend most of the time in flocks, which wander according to the supply of food and are noteworthy for the uniformity with which all members alight or rise together. The food consists chiefly of berries when these are to be had, on which account they have received the name of cherry-birds in some sections. Nesting takes place late, when the summer is well advanced, and the rather bulky structure is usually placed in an apple or other orchard tree. The eggs are four to six in number, pale blue, and thickly speckled.

Cedar Creek, a stream in Shenandoah County, Virginia, flowing into the North Fork of the Shenandoah River.

Cedar Creek, Battle of. After the battle of Fisher's Hill, 22 Sept. 1864, Gen. Sheridan followed Early as far as Harrisonburg, his cavalry going as far as Port Republic, Staunton, and Waynesboro. In view of the difficulty of supplying his army so far from its base, and of other operations by which two corps of infantry and a cavalry division of his army were to be sent to the Army of the Potomac, he holding only the lower valley of the Shenandoah, Sheridan, after ordering the destruction of all mills, barns, grain, forage, and provisions of all kinds, began to withdraw down the valley on 5 October, and on the 8th recrossed Tom's Brook. His rear had been so persistently followed and harassed by the Confederate cavalry divisions of Rosser and Lomax that he ordered Torbert, his cavalry commander, to whip the Confederate cavalry or get whipped. On the morning of the 9th Torbert fell upon Rosser and Lomax, and in a two-hours' contest routed them, pursuing many miles and capturing over 300 prisoners, 11 guns, and 40 wagons. Sheridan then resumed his march, and on the 10th halted on the north bank of Cedar Creek. Wright's Sixth Corps continued its march to Front Royal, on the way to Washington, where it remained two days, and then marched toward Ashby's Gap, but was recalled to Cedar Creek, where it arrived on the 14th. Early had been reinforced by Kershaw's division and about 600 cavalry,

increasing his force to about 18,000 men, and under Lee's order to detain the Union troops in the valley he had followed Sheridan, arriving at Fisher's Hill, six miles from Cedar Creek, on the 13th. On the night of the 15th Sheridan left for Washington to consult with Stanton and Halleck, leaving Gen. H. G. Wright in command of the army. Sheridan's cavalry accompanied him to Front Royal, from which point he intended to push it through Chester Gap to the Virginia Central R.R. at Charlottesville and raid the country east of the Blue Ridge, but upon erroneous information that Longstreet was moving to join Early, the raid was abandoned and Torbert moved the cavalry back to Cedar Creek. On the night of the 18th Emory's Nineteenth corps was on the west side of the valley turnpike, on elevated ground overlooking Cedar Creek. Wright's Sixth corps in reserve to the right and rear of the Nineteenth, separated from it by Meadow Brook. Merritt's cavalry division was on the right of the infantry, and Custer's division 1½ miles beyond Merritt's, watching the crossings of Cedar Creek and the roads on the right. Crooks' Eighth corps was on the east side of the pike, one of its two divisions (Thoburn's) on a rounded, entrenched hill, one fourth of a mile in advance of the other, near the junction of the creek and river, and both somewhat in advance of the Nineteenth corps on the right. Two cavalry brigades of Powell's division were far to the left, near Front Royal, and one at Buckton Station, two miles beyond Crooks' left. The Union army numbered about 31,000 men. Reconnoissances were sent out daily from the flanks to see what Early was doing, and that of the Eighteenth reported that the indications were that he had retreated from Fisher's Hill. He had not retreated, but had matured a plan of attack. A reconnoissance by Gen. Gordon had disclosed the fact that the left of the Union line was lightly picketed, with but a small cavalry force on the North Fork of the Shenandoah, and that it was practicable to move infantry secretly by night across the creek, which was easily fordable, and through the woods to within less than half a mile of Crooks' left and rear. This plan Early adopted, assigning for the movement the divisions of Gordon, Ramseur, and Pegram, and Payne's cavalry brigade, all under command of Gordon. Early, with the divisions of Kershaw and Wharton and all his artillery, was to co-operate in the effort to crush the Union left and centre. Two brigades of cavalry were to demonstrate on the Union right, and Lomax's cavalry, moving by Front Royal, was to strike the valley pike in the Union rear. The movement began after dark of the 18th. Gordon led his column across the North Fork of the Shenandoah, down its right bank, and again crossing below the mouth of Cedar Creek, reached his assigned position before daylight. Early led Kershaw across Cedar Creek, midway between its mouth and the pike, and at the first flush of dawn, covered by darkness and fog, captured or drove in the picket line and rushed over the intrenchments held by Thoburn's division, at a point where they were not manned, surprised the camp, soon swept everything out of it, and captured seven guns, which were turned upon the fugitives. Kershaw then advanced on R. B. Hayes' division and Kitching's brigade, and at the same time Gordon charged out of the woods directly upon Hayes' left and rear, the combined attacks breaking his division and Kitching's brigade, and uncovering the left of the Nineteenth corps, which was now assailed by Kershaw and Gordon, while at the same time Wharton's division, moving swiftly down the pike, followed by 40 pieces of artillery, attacked in front, and the greater part of the Nineteenth corps, abandoning 11 guns, was swept from the field. Wright, who had foreseen at the beginning of the attack that his position was untenable, and a change of front necessary, now ordered the Sixth corps, under Gen. Ricketts, who was moving with two divisions to support the left, to fall back to some tenable position, and the Nineteenth corps was ordered to rally on the right of the Sixth. The Confederates followed up their advantage, taking many prisoners, but were checked by the Sixth corps, Wharton being badly repulsed. Early still pressed matters; it was now 9 o'clock, and Wright, losing six guns of his own corps, withdrew to a more favorable position one and a half miles north and west of Middletown, where he was joined by the cavalry brigade from Buckton and by Torbert, with the two cavalry divisions that had been ordered from the right to left of the infantry line; while the division commanders of the Sixth and Nineteenth corps were told the enemy would be attacked about 12, noon, as soon as an ample resupply of ammunition could be issued. Meanwhile Sheridan, who had arrived at Winchester on the afternoon of the 18th, was hastening to the front, meeting on the way a stream of fugitives, whom he ordered to turn back, as he intended to reoccupy the old camp that night. He arrived on the field a little after eleven o'clock, during a lull in the fight, after Wright had reunited the divisions of the Sixth corps, which had been fighting by themselves during the morning, and after the Nineteenth corps had been rallied and placed in line, also parts of the Eighth corps, the only part of the army seriously engaged being a division of the Sixth corps and the cavalry, tenaciously holding the valley pike, the key-point of the battle. Wright's disposition of the infantry was approved, and the only change made in the line was to send Custer's cavalry back to the right of the infantry. About one o'clock Early pushed forward his entire line, but was quickly repulsed, and then busied himself in collecting his stragglers, who were plundering the captured camps, getting his prisoners and captured guns and wagons back to Fisher's Hill, and throwing up a defensive line beyond the reach of the Union artillery. At four o'clock Sheridan saw a movement of Early's, which he thought indicated an attack, and ordered a general advance, the Nineteenth corps on the right, the Sixth on the left, with the Eighth following in reserve, Custer's cavalry on the right, and Merritt's on the left of the infantry. The movement developed into a left half-wheel, and after a very severe and obstinate fight, during which parts of the Union line were repulsed, again to go forward, was successful; the Confederate line was broken near its left, other parts of the line gave way, and soon the entire army fled in panic and disorder from the field and across Cedar Creek, Sheridan's infantry following as far as the creek, the cavalry continuing the pursuit three miles beyond and until after dark, capturing guns, wagons, ambulances,

and prisoners. Early, with but few of his men, rested at night in his intrenchments at Fisher's Hill, and at 3 o'clock next morning retreated to New Market, followed by Sheridan's cavalry as far as Woodstock. The 24 guns captured by Early were retaken, and he left in Sheridan's hands 23 of his own. The Union loss was 644 killed, 3,430 wounded, and 1,591 missing; of the latter 1,429 were sent as prisoners to Richmond. The Confederate loss was 320 killed, 1,540 wounded, and 1,050 missing. Early's offensive movement suspended for a time the transfer of any part of Sheridan's army to the Army of the Potomac; his defeat ended efforts on the part of the Confederates to invade the North by way of the Shenandoah valley. Consult: 'Official Records,' Vol. XLIII.; Pond, 'Shenandoah Valley in 1864'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Sheridan, 'Personal Memoirs'; Keifer, 'Slavery and Four Years of War,' Vol. II.

E. A. CARMAN.

Cedar Falls, Iowa, a city in Black Hawk County, situated on Cedar River and on the Burlington, C. R. & N., the Illinois Central, and the Chicago & G. W. R.R.'s, 85 miles northeast of Des Moines. It is actively engaged in manufacturing, having a foundry, a pump factory, and mills turning out flour, oatmeal, paper, etc. A State normal school is located here. Pop. (1900) 5,319.

Cedar Keys, Fla., a seaport in Levy County, on the Gulf of Mexico, 118 miles southeast of Tallahassee. It takes its name from the keys surrounding the harbor. There is a lighthouse on one of the keys. The town has a large trade in pine, cedar (largely used for pencils), sponges, and fish. Pop. (1900) 739.

Cedar Lake, a lake of Canada, in the Saskatchewan district, a sort of expansion of the river Saskatchewan, receiving the waters of this large stream to pour them over the Grand Rapids into Lake Winnipeg. Between Grand Rapids and Cedar Lake is another expansion, known as Cross Lake. Cedar Lake is nearly 30 miles long, and where widest 25 broad; area about 312 square miles. Its depth of water is sufficient for the largest craft, except on the northwest, where the quantity of alluvium brought down by the Saskatchewan is rapidly filling it up. Both the mainland and the islands are well wooded with balsam spruce, birch, poplar, tamarack, Banksian pine, and cedar, the last growing on the shores of the lake, particularly the northwest, and giving it its name.

Cedar Mountain, Cedar Run, or **Slaughter's Mountain, Battle of.** On 8 Aug. 1862, Crawford's brigade of Bank's corps marched from Culpeper Court-house, eight miles to Cedar Run, to support Bayard's cavalry brigade, which was being driven back by Stonewall Jackson, who, with the three divisions of C. S. Winder, Ewell, and A. P. Hill, in all nearly 24,000 men, was advancing from Gordonsville to seize Culpeper. On the 9th Bank's entire corps, at Little Washington, was ordered to follow Crawford, and Sigel was ordered to march his corps from Sperryville to the same point. Banks joined Crawford at Cedar Run about noon and took position on elevated ground just beyond it, covering the road to Culpeper, Crawford's brigade and six companies of the 3d Wisconsin, of Gordon's, on the right of the road, partially concealed in woods. Gordon's brigade was held in reserve on the hither side of the stream. Across the road on Crawford's left was Geary's brigade; Prince's brigade was on Geary's left, and Greene's small brigade to the left of Prince and somewhat refused. Seven batteries of artillery were distributed on the plateau slightly in advance of the infantry. Banks had about 8,000 men. Jackson crossed the Rapidan on the 8th, and about noon of the 9th drove back Bayard's cavalry, and following, came under fire of the Union artillery and prepared for battle. Early's brigade was ordered to advance, keeping to the right and close to the Culpeper road, while Ewell led his two other brigades farther to the right along the slope of Cedar Mountain. Early advanced until he came under severe artillery fire, when he halted under cover of a small hill, and C. S. Winder's division and three batteries came up on his left, Campbell's brigade on the extreme left, then Taliaferro's, with Winder's brigade in reserve. While placing his batteries on and near the road Winder was mortally wounded by a piece of shell. It was now five o'clock, and Banks gave the order to advance and attack. The three brigades of Crawford, Geary, and Prince threw out skirmishers, drove in those of the Confederates, and the main line advancing became severely engaged. Early's right held its own against Prince, but on the Union right Crawford, advancing with great impetuosity, attacked and routed Campbell's brigade; then swung to the left, fell upon and (with the assistance of Geary) routed Taliaferro and shook Early's left. It was going hard with Early when Hill's division came up and, forming on his right and left, restored the fight, checked Crawford's further success, drove him and Geary back, and held Prince in check. Then the 10th Maine, of Crawford's brigade, which had been held in reserve, went forward on the extreme right, and in less than 10 minutes was compelled to retreat with a loss of nearly one half its men. At the same time a battalion of Pennsylvania cavalry charged down the road and was instantly driven back in disorder. Gordon's brigade came on the field as the 10th Maine was going out. In its advance it moved a little to the right of where the 10th Maine had been, and was met by the brigades of Branch, Archer, and Winder, with such a withering front and flank fire that it was badly cut up and parts of it driven, again to rally and go forward, but, under cover of the woods, Pender's brigade gained its right and rear, poured in a volley and drove it from the field. The artillery had now been withdrawn and the Confederates advanced. Prince's brigade fell back, leaving Prince and many of the men prisoners, and Greene, on the extreme left, who had not been seriously engaged, but had held Ewell's two brigades in check, was withdrawn. Night had now fallen, but Jackson, desiring to enter Culpeper before morning, gave immediate pursuit, and when 1½ miles from the field was checked by Banks' rallied troops and Rickett's division, which had come up from near Culpeper, followed later by Sigel. Gen. Pope also had arrived and assumed command. The Union loss was 1,759 killed and wounded and 504 missing. The Confederate loss was 1,338 killed and wounded and 31 missing. Pope and Jackson confronted each other on the 10th

and 11th, but on the night of the 11th Jackson retreated, abandoning many of his wounded, recrossed the Rapidan, and marched to the vicinity of Gordonsville. Consult: 'Official Records,' Vol. XII.; Ropes, 'The Army Under Pope'; Gordon, 'Army of Virginia'; Allan, 'Army of Northern Virginia in 1862'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II. E. A. CARMAN.

Cedar Mountains, a mountain range in Cape Colony, extending nearly along the meridian of 19° E., for about 25 miles southward, beginning with lat. 32° S., and rising at some places to the height of 5,000 feet. Fine cedar-trees of gigantic size formerly covered these mountains, and still do so to a considerable extent. These mountains contain many Bosjesman caves.

Cedar Oil, an aromatic oil obtained from the American red cedar (*Juniperus virginiana*). It is used for scenting soaps.

Cedar Rapids, Iowa, city in Linn County, on the Cedar River, and on the Burlington, C. R. & N., the Chicago & N. W., the Chicago, M. & St. P., and the Illinois Central R.R.'s, 79 miles southwest of Dubuque. The city is regularly laid out and well built, and is the trade centre of the surrounding country. It contains large pork-packing establishments, and the river supplies power for numerous manufactories, including machine-shops and foundries, woolen-mills, breweries, carriage factories, extensive works for making agricultural implements, etc. It has waterworks, a high school, daily and weekly newspapers, public and Masonic libraries, and national banks. It is the seat of Coe College. The city is connected with the opposite bank of the river by a handsome bridge. Pop. (1900) 26,656.

Cedar, or **Red Cedar, River,** a river rising in the southern part of Minnesota and flowing southeast through the eastern part of Iowa to Muscatine County, where it turns southwest and empties into the Iowa River, after a course of about 350 miles.

Ce'dartown, Ga., a city and county-seat of Polk County, on the Central of Georgia and the East & W. R.R.'s, 108 miles northwest of Columbus. It is located in a fruit-growing and iron-mining region, and has foundries, machine-shops, etc. A trade in lumber is also carried on. Pop. (1900) 2,823.

Cedilla, sẹ-dil'la, a mark used under the letter c in French and Portuguese when the c stands before a, o, or u, to indicate that it is to be pronounced like the English s, not like k, as is usual before these letters. A c with the cedilla under it is written ç.

Cedrela, sĕd'rē-la, a genus of large timber trees, natives of the tropics of both hemispheres, giving name to the order *Cedrelaceæ*, which is now usually included in *Meliaceæ*. The species have evergreen, equally pinnate leaves, and small bell-shaped white flowers. *C. odorata* of Honduras and the West Indies yields bastard cedar. *C. australis* is a valuable Australian timber tree. *C. toona*, a native of Bengal, furnishes timber much like mahogany. The bark is very astringent, and has been found valuable in fevers, dysentery, etc. The flowers are used for producing a red dye. The bark of *C. febrifuga* is used against the intermittent fevers of Java.

Cedrelaceæ, sĕd-rē-lā'sē-ē, the mahogany family, a natural order of dicotyledonous plants, nearly allied to, if really separate from, the *Meliaceæ*. They are trees with alternate pinnate leaves and a woody capsular fruit. Different species yield mahogany, satin-wood, yellow-wood, etc. The typical genus is *Cedrela* (q.v.).

Cedric, a steamship of the White Star Line, a type of modern steamship construction. She was built by Messrs. Harland & Wolff, at Belfast, Ireland, and is constructed of steel. Her length is 700 feet; greatest breadth, 75 feet; and depth, 49 feet 4 inches. Her gross tonnage is 21,000, and her displacement tonnage 38,200. Her launching weight was 14,257 tons, and her dead-weight carrying-capacity 18,400 tons. She has nine decks and is built on the cellular double-bottom principle, with many water-tight compartments designed to render her practically unsinkable.

The Cedric is propelled by twin screws, driven by two sets of quadruple engines, to operate which eight double-end boilers are employed, each capable of working up to a pressure of 210 pounds to the square inch. The oval funnels which carry off the smoke and waste gases from her furnaces are 14 feet 3 inches by 11 feet in diameter, and the height from their top to the keel is 131 feet. While the vessel is not built for speed, she is yet capable of developing 17 knots an hour, a rate which enables her to cover the passage between New York and Liverpool in from seven to eight days.

Passenger accommodations are provided for 350 in the first saloon, 250 in the second saloon, and 2,000 in the steerage. With 335 in the crew, her total population, with all berths filled, will amount to 2,935. The saloon dining-room is situated on the upper deck and covers the extreme width of the vessel. The state-rooms include suites of bed-, sitting- and bath-rooms, and in the steerage there are to be found, besides the usual open berths, cabins with two, four, or six berths. The third-class passengers have the use of dining-, sitting- and smoking-rooms, and all parts of the ship are ventilated by electric- and steam-driven fans. Some idea of the ship's massive construction may be gained from the fact that some of her plates weigh as much as three tons, while her great stern frame contains over 50 tons of metal.

Cefalù, chā-fā-loo' (ancient CEPHALŒDIS), Italy, a seaport and episcopal city of northern Sicily, 39 miles east-southeast of Palermo. It is surrounded by an old wall and has a very picturesque site at the foot of a precipitous rock. The trade is not large, but an active fishery is carried on. Sardines are caught in abundance.

Cehegin, thā-ā-hēn', Spain, a town in the province of Murcia and 39 miles west-northwest of the city of Murcia, four miles east of Caravaca, on a declivity facing the south. It has numerous spacious streets, and two squares, lined with substantial houses and neat public buildings, comprising a parish church, three chapels, town- and court-houses, a prison, hospital, theatre, cemetery, and several schools. The manufactures include paper, cloth, soap, pottery, brandy, wine, and oil. There is also trade in grain, wool, hemp, silk, wax, cotton,

etc. In the neighborhood various quarries of jasper and variegated marble are wrought. Pop. 12,000.

Ceiling, the upper surface of a room. The word seems to have been suggested by the use of arched coverings for churches, and even for rooms, which prevailed in the Middle Ages, and was not unknown to the Romans. Arched ceilings among the Romans were known by the name cameræ or camera, the Greek origin of which seems to furnish an argument in favor of the view that the arch was known to the latter people. The camera was formed by semicircular beams of wood, at small distances from each other, over which was placed a coating of lath and plaster. In later times the cameræ were frequently lined with plates of glass, when they were termed vitreæ. But the ceilings most common among the Romans were flat, the beams, as in modern times, having been at first visible, and afterward covered with planks and plaster. Sometimes hollow spaces or panels were left between the planks, which were frequently covered with gold and ivory, or paintings. The arched ceilings of the Romans were commonly of brick or concrete covered with stucco, and were of three kinds: barrel vaults, groined vaults, and domes. The favorite ceiling in the East was the dome, that in the West during the Middle Ages, was the groined and ribbed vault. Modern ceilings are generally flat and are of plaster or wood. When the ceiling is divided into deep panels it is said to be coffered. See VAULTING.

Celakowsky, chā-lä-kŏv'skē, **Fran'tisek Lad'islaw,** Bohemian poet and philologist: b. Strakonitz 7 March 1799; d. Prague 5 Aug. 1852. He was destined for the pulpit, but from patriotic impulses declined to adopt that profession, and engaged in 1821 as instructor in a nobleman's family. In 1828 he became associate editor of the 'Quarterly Review for the Catholic Clergy,' published by the consistorium at Prague, and in 1834 editor of the 'Bohemian Gazette,' and of the 'Bee,' a literary journal. He also commenced a series of lectures on the Cechic language and literature, at the university of Prague. He lost both his situation as editor and that at the university, in consequence of a remark against the Emperor Nicholas. The Bohemian society for the propagation of science elected him a member in 1840. In 1842 he accepted a professorship of the Slavic language and literature, recently established by the king of Prussia for the benefit of his Polish subjects, at the university of Breslau. After the events of 1848, the Austrian government, which now sought for support from the Cechic nationality, offered him a professorship at the university of Prague. Of his numerous works, the following are most remarkable: 'Poems' (1822); 'Slavic National Songs' (1822–7); 'Lithuanian National Songs' (1827); a metrical translation of Walter Scott's 'Lady of the Lake' (1828); a translation of Augustine's 'De Civitate Dei' (1829–32); 'Echo of Russian National Songs' (1829); 'Echo of Cechic National Songs' (1840). One of his latest works was the 'Popular Philosophy of the Slavic Nations in their Proverbs' (Prague 1851). After 1835 Celakowsky was engaged in a comparative study of all the Slavic dialects, the fruit of which is given in part in his additions to Jungmann's Cechic dictionary. As a poet he is distinguished by the grace and *naïveté* of his popular songs.

Celandine, sĕl'an-dīn (*Chelidonium*), a genus of herbs of the natural order *Papaveraceæ*. The few species are natives of Europe, where they are widely distributed, and whence they have spread to other parts of the world. It is common in some of the older parts of the United States, having escaped from gardens. Common celandine (*C. majus*), which is most frequently seen, is an ill-smelling biennial or perennial plant with brittle hairy stems, pinnate leaves, small yellow flowers in small umbels, and slender two-valved pods. The plant has long been popular in old-fashioned gardens. It is easily grown from seed and produces abundant flowers all through summer. All parts contain an acrid yellow juice, for which the plant has been sometimes used in medicine, though it is now used practically only by the Eclectics. It is a drastic purgative, but its action is very irregular and difficult to control, and hence it has not been introduced into regular medicine because of its many inequalities.

Celano, Tommaso da, tōm-mä'sō dä chä-lä'nō, one of the reputed authors of the Latin hymn 'Dies Iræ': b. Celano, in the Abruzzi, toward the end of the 12th or about the beginning of the 13th century; d. Italy after 1250. He was one of the most devoted adherents of St. Francis of Assisi, and after the establishment of an order of Minorite friars on the Rhine was appointed keeper (custos) of the Rhine districts. In 1230 he returned to Italy. He wrote a life of St. Francis, and several hymns. His claim to the authorship of the 'Dies Iræ' seems now fairly well established, but is still disputed in favor of Matthäus Aquasparta (d. 1303), Cardinal Frangipani (d. 1294), and even St. Bernard, Gregory the Great, and others. His name is first mentioned in connection with the poem toward the close of the 14th century.

Celastraceæ, sĕl-ăs-trā'sē-ē, an order of polypetalous dicotyledons, consisting of shrubs and small trees, natives of southern Europe, Asia, America, Australia, etc., most of them of no great importance. They have generally acrid properties. The chief genera are *Celastrus, Euonymus,* and *Elæodendron.*

Celaya, sä lä'ya, Mexico, a town in the state of Guanajuato, on the Rio Laja, about 150 miles northwest of the city of Mexico. It has several fine plazas, handsome churches, among which is that of Our Lady of Carmen, a magnificent structure, and manufactures of cotton and woolen cloths, saddlery, and other articles. The burning of its bull-ring, on Easter Sunday, 1888, caused considerable loss of life. Pop. 22,000.

Celebes, sĕl'ĕ-bĕs or sĕl'ĕ-bēz, Dutch East Indies, one of the larger islands of the Indian Archipelago, between Borneo on the west and the Moluccas on the east, extending from lat. 1° 45′ N., to 5° 52′ S., and from lon. 118° 45′ to 125° 17′ E., remarkable for the singularity of its shape. It consists mainly of four large peninsulas stretching to the east and south, and separated by three deep gulfs. The total area of the island is a little over 71,000 square miles.

Celebes is high and mountainous chiefly in the centre and the north, where there are several

active volcanoes. The absence of extensive deltas, and the intervention of broad grassy plains between the forests, distinguish it from the other larger islands of the Indian Archipelago. All that is most majestic and lovely in these is thought to be concentrated in this island. It abounds in the most picturesque and varied scenery, and the most beautiful and magnificent tropical vegetation. Though cut by the equator, and wholly within the torrid zone, Celebes is considered remarkably healthful, the natives often enjoying a vigorous old age, and Europeans living longer than anywhere else in the East. Its extreme heats are tempered by the sea-breezes, by monthly rains, and by the north winds that prevail for part of the year. The east monsoon lasts from May to November, and the west during the remaining months. The soil generally consists of a bed of vegetable mold from 10 to 20 feet thick, on decomposing basalt. Gold is found in all the valleys of the north peninsula, which is often convulsed by earthquakes, and abounds in sulphur. Copper of good quality occurs at various points, and in Macassar tin also, as pure as that of Banka. Diamonds are sometimes found almost at the surface of the ground, and precious stones are carried down in the sand of the torrents. The island is entirely destitute of the large carnivorous animals and pachyderms. None of the cat kind are seen in its forests; nor has it the elephant, the rhinoceros, or the tapir. Deer and wild hogs abound, together with the babirussa and herds of antelopes. Pouched animals, unknown in the Sunda Islands, here first occur, and there is a black tailless baboon or ape. Among domesticated animals are found small but vigorous horses, buffaloes, goats, sheep, and pigs. Trepang and turtle are caught in abundance. Among the trees are the oak, teak, cedar, upas, bamboo, etc.; among plants requiring more careful cultivation, the coffee-tree, indigo, cacao, sugarcane, manioc root, and tobacco.

The maritime districts of Celebes are inhabited by Malays; the Peninsula of Macassar by Bugis and Macassars. Mandhars dwell in the west of the island, and the mountainous regions in the interior are inhabited by Alfurese. In the harbors also there are many Chinese and Oorang Badjus or Oorang Laut, a mixed race partly of Malay and partly of Battak origin, who live in their boats, and roam over the whole archipelago, gaining their livelihood by fishing. The natives are subject to several petty rulers, more or less dependent on the Dutch. The capital is the town of Macassar, in the southwest of the island, in the bazaar of which are sold all the products of the neighboring islands as well as of Celebes itself, among which are bamboo canes, sandal-wood, cajeput oil, nutmegs, rice, coffee, pearls, birds'-nests, trepang, birds of paradise, etc. The trade in trepang is very important, Macassar being the chief staple place for this article of commerce. The chief harbor of the north is that of Kema, on the east coast of Minahassa. The coffee of Menado is excellent, and is even preferred to the best Javanese coffee. A recent return states the number of coffee-trees in Minahassa at nearly 6,000,000 and the export of coffee at about 5,000,000 pounds. The harvest of cocoanuts is also considerable. A European controller superintends the cultivation of the coffee-tree in his own district, advises the village chieftains, acts as the protector of the natives, and negotiates between them and the Dutch government.

The languages and literature of Celebes differ essentially from those of the countries to the west. The letters of its alphabet are in form as unlike the Javanese as the latter are unlike the Arabic or Roman. The three great languages of the island, not reckoning the dialects of the savage tribes, are those of the Bugis, the Macassars, and of Mandhar. The modern Bugis is the most cultivated and copious; the Macassar is simpler, and its literature more scanty; both are distinguished for a soft and vocalic pronunciation. The Bugis have a considerable body of literature. The more civilized inhabitants profess Mohammedanism; but previous to the introduction of that faith, the Hindus had brought their religion to the island.

The island of Celebes was first visited by the Portuguese in 1512. In 1607 the Dutch entered into commercial relations with Macassar, and gradually acquired and extended control until, early in the 19th century, they made their supremacy complete. The population is estimated at nearly 2,000,000.

Cel'eres, a body of horsemen traditionally said to have been introduced by Romulus, and to have numbered 300, consisting of citizens rich enough to furnish a horse. They are also described as subdivided into three centuries, under the name of Ramnes, Titienses, and Luceres. The number of the centuries of the Celeres is said to have been raised to six by Tarquinius Priscus, this being the origin of the equites or knights, who in after times formed a separate class of citizens.

Celeriac, sē-lĕr'ĭ-ăk. See CELERY.

Cel'ery, a biennial or annual herb (*Apium graveolens*), of the natural order *Umbelliferæ*. It is a native of Europe, Asia, and Africa, in the older civilized parts of which it was cultivated prior to the Christian era. In nature the plants are commonly found in moist ground, where they attain a height of from 6 to 15 inches. They have numerous leaf-stalks odd-pinnate leaves, and branching leafy flower-stalks two to three feet tall and bearing many small umbels of small white flowers which give place to seeds (fruits) so small that 60,000 or more are needed to weigh an ounce. Cultivated celery does not differ in general characteristics from the wild plant, but by cultivation its leaf stalks (the part desired for the table) have been made more solid, less stringy, and more agreeably flavored. In many instances, too, they have been lengthened or increased in number, and made to form more compact plants. Celery is usually blanched and eaten raw with salt, but often it is used as a cooked vegetable, and its leaves, roots, or ground seeds are frequently used for flavoring. Celeriac or turnip-rooted celery is largely grown in Europe, but little in America. It does not require blanching, but is otherwise cultivated like celery.

Celery is usually started in unheated beds, and the young plants set out in the field when a few inches tall, after being transplanted once or sometimes twice. The soil best suited to the plant is a rich, friable, peaty loam well supplied with moisture, but well drained. As the plant is a gross feeder abundant manure must be given. Celery will, however, do well in any

moist, rich garden soil. In one method of growing, the plants are set about six inches apart in rows spaced from three to four feet, and the ground is kept loose and free from weeds by frequent cultivation, the plants being gradually covered with earth, or "earthed up," as they approach edible size, or they may be blanched by shading the stems with boards, straw, etc. In another method they are set closer together in the rows, which are rarely more than 12 inches apart. The size of the variety is a governing factor in the matter of distances; some varieties grow only 12 or 15 inches tall, others more than two and a half feet. In this "new celery culture" no earthing-up is necessary, as the plants blanch themselves. Summer celery is blanched quickly by the former method; autumn and winter celery more slowly. Indeed, the process is frequently continued in the winter storing quarters, which usually consist of specially constructed houses or cellars, the floors of which are covered with a few inches of earth, in which the roots obtain some food and water.

Celery is frequently attacked by parasitic diseases, but most of its insect enemies are controlled by parasites and rarely become troublesome enough to demand special attention. The chief fungous parasites are sun-scald or rust (*Cercospora apii*), which appears upon the leaves as yellow or gray blotches which enlarge and gradually destroy the whole leaf. It is more frequent on plants grown in dry soils. Leaf-blight (*Septoria petroselina apii*) appears on the leaves and stems as watery spots which become dotted with black spores. These parasites may be controlled by spraying with a standard fungicide (q.v.). Several other parasites are occasionally troublesome, but they can usually be similarly controlled.

In the United States the celery industry developed enormously during the closing quarter of the 19th century. From being restricted to the individual gardens and fields of market gardeners who grew it as one of their ordinary crops, it has in many localities become a specialized business, with machinery adapted to its particular needs. And from demanding only part of the time of the market gardener it now occupies the attention of hundreds of men in certain districts. In Michigan, California, and New York there are thousands of acres devoted to this crop, and from some of these districts hundreds of carloads of celery (even trainloads from California) are sent to Chicago, St. Louis, Kansas City, New York, Boston, Philadelphia, and other large distributing centres. Instead of having celery as a delicacy for a few weeks during autumn and winter, American tables are supplied throughout the year with this vegetable, which has risen to the rank of a necessity, a development due mainly to improvements in the management of the crop, but partly to improved transportation and storage methods.

In medicine celery enjoys a certain popular reputation by reason of the apiol which it contains. This has an action similar to that of many of the volatile oils, but in addition it dilates the blood vessels, particularly of the pelvic viscera and is, therefore, useful in disorders of menstruation, in chronic constipation, and disordered intestinal states in general. It is also diaphoretic and diuretic.

Celeste, se-lĕst, **Madame,** French actress: b. Paris 6 Aug. 1814; d. there 12 Feb. 1882. A pupil at the Conservatoire, she early showed remarkable talent. She made her début in 1827 at New York, and during her residence in the United States married a Mr. Elliott. At Liverpool, in 1830, she played Fenella in 'Masaniello'; in 1831–3, she became extremely popular in London. Her second visit to the United States (1834–7) is said to have brought her $200,000. After her return she took part successively in the management of the Theatre Royal, Liverpool, and the Adelphi and Lyceum in London. Her imperfect English long confined her to non-speaking parts. She retired from the stage in 1874.

Celes'tial Empire, The, a popular name for the Chinese Empire, taken from the Chinese appellation for the country, "Tien Chao" (Heavenly Dynasty). Hence the name "Celestials," applied to natives of China.

Celestial Sphere, the skyey background on which all celestial objects appear projected. It is supposed to be of indefinite radius, with the observer at the centre. It is crossed by systems of imaginary circles which serve to fix positions upon its surface by means of spherical co-ordinates. See CO-ORDINATES.

Cel'estine I., Saint, a Pope memorable in the annals of the Church as having convoked the general council of Ephesus, 431; as having given to Palladius and Patricius mission to the Irish and the Caledonians, and as having checked the progress of Pelagianism and Novationism. Of his birth or his age there is no record, but he died in 431 and his day in the Roman calendar (that is, the day of his death) is 7 April: he occupied the see of Peter about eight years and a half. Celestine was represented in the Ephesine council by his legates, and at his instance the council condemned the heresy of Nestorius; and of his letters to bishops of various churches both in the East and the West, communicating to them the council's decrees, four are extant, namely: those to the African bishops and to the bishops of Illyria, of Thessalonica, and of Narbonne.

Celestine II., Pope (Guido di Castello): b. Tiferno, Tuscany; d. Rome March 1144. He had studied under Abelard, and succeeded Innocent II. in 1143. It was this pontiff who granted absolution to Louis VII. of France, and removed the interdict which for three years was laid upon that country.

Celestine III., Pope (Giacinlo Orsini): b. about 1106; d. Rome 8 Jan. 1198. He succeeded Clement III. in 1191, when, it is believed, about 90 years of age, and reigned till 1198. He crowned the emperor Henry VI. of Germany in 1191, but afterward excommunicated both Henry and Leopold, duke of Austria, on account of the captivity of Richard Cœur de Lion.

Celestine IV., Pope (Goffredo Castiglione): b. Milan; d. 22 Sept. 1241. When a monk at Hautecombe in Savoy, he wrote a history of Scotland. He was elected Pope in 1241, but reigned only 17 days, having died, it is said,

of poison before the ceremony of consecration was performed.

Celestine V., Saint, a Pope celebrated as the one occupant of the papal see who, his title undisputed and no demand made for his retirement, voluntarily and of his own motion abdicated the pontificate. He was a Neapolitan, born in 1215, and while a lad entered the order of Benedictines. From the first he practised the greatest austerities, and at the age of 24 years, for the sake of freedom in the pursuit of religious perfection, he quitted the monastery and adopted the solitary or eremitical life in a cave of Mount Morone, whence his surname, Peter di Morone. After five years spent in this solitude he, with two companion hermits, migrated to a similar cave in the Monte di Majella in Bruttium. Here disciples flocked to him in scores, and to these he gave a rule of life and thus laid the foundation of a new monastic order which later received papal approval; after the death of the founder the order assumed the title of Celestines. While Peter di Morone was, as superior-general, governing 36 communities of the new order comprising 600 monks, he was elected Pope 7 July 1294. He protested vigorously against this unexpected promotion, but at last was prevailed upon to assume the burden of the papacy. As Pope he promulgated two decrees, one re-enforcing the rule which requires that the cardinal electors of a Pope shall be strictly secluded in the conclave; and the other that a Pope may lawfully and validly lay down his office. At the end of five months and eight days he acted on this definition and abdicated, out of a desire, as he publicly declared, "for humility, for a purer life, for a stainless conscience, and in view of his lack of physical strength, his ignorance, the perverseness of the people, and his longing for the tranquillity of his former life." All eminently strong and good and honorable reasons, and worthy of the sincerely religious soul that was moved by them. His successor in the papacy, Boniface VIII., doubtless fearing lest the honest hermit should repent of his abdication and resume the papal title, made him a prisoner and confined him in a strong castle where he died, after languishing 10 months, 19 May 1296. Some commentators of Dante ('Inferno,' iii., 60) think that Celestine is the damned soul,

> Who to base fear
> Yielding, abjured his high estate,

(Cary's trans.), or as the verse is rendered by Longfellow —

> The shade of him
> Who made through cowardice the great refusal.

But as has been well remarked, "Dante knew better than to consign a man to eternal pain for having declined the path of ambition." Celestine V.'s day in the Roman calendar is 19 May, but he is there styled not simply Saint Celestine, but Saint Peter Celestine (Petrus Cœlestinus). His canonization took place 11 years after his death. See CELESTINES.

Cel'estine, in mineralogy. See CELESTITE.

Cel'estines, a monastic order of the Roman Catholic Church, a branch of the great Benedictine order. It was founded by Pietro di Morone, afterward Pope Celestine V. (q.v.). To Pietro di Morone, who was leading an eremitical life in a wilderness, so many men resorted for spiritual guidance that he was induced to form them into a religious community under a rule drawn up by himself. The institute was approved by Pope Urban IV. in 1264, 10 years after it had been founded, but not as an independent order, for it was made a branch of the Benedictines, under a rule based on the rule of that order. The mother house of the institute was on Monte Majella in the Abruzzi, and 30 years after it was affiliated to the Benedictine order its primacy was acknowledged by 36 establishments having 600 members. The founder now relinquished the office of superior-general and resumed his former eremitical life. After Pietro was made Pope Celestine the order, till then known as Hermits of Saint Damianus and popularly as Moronites, took the name of Celestines. The order spread throughout Italy and beyond the Alps to France, Germany, and Flanders: so strong was its French branch early in the 15th century that it obtained for itself from the popes bulls that made it in a measure independent of the superior-general. But in the 17th century the order was already in process of rapid decay, and in the 18th many of its establishments were dissolved by papal decree, and many more by the secular powers. The order is now extinct.

Cel'estite, a native form of strontium sulphate, $SrSO_4$, crystallizing in the orthorhombic system, and also occurring in fibrous and radiated forms. The crystals resemble those of barite, and are usually tabular or prismatic. They have a hardness of from 3 to 3.5, and a specific gravity of 3.96. Celestite is commonly white with a vitreous lustre, but it also occurs with a pronounced bluish tinge, from which circumstance it received its name. When found in quantity it is a useful source of strontium. Fine crystals of it occur in the limestone about Lake Erie. Other important localities are in Sicily, Hungary, England, Canada, West Virginia, and California. Varieties containing large amounts of calcium or of barium are called calciocelestite and barytocelestite respectively; and the mineral itself is often called celestine.

Cel'ibacy, the state of being unmarried; especially the voluntary single life undertaken by religious devotees and by some clerical orders, as those of the Roman Catholic Church. Paul (1 Cor. vii.) recommends virginity, without condemning matrimony. The Roman Catholic Church respects matrimonial chastity, but esteems virginity a higher virtue.

From the time of the apostles it became a custom in the Church for bishops, priests, and deacons to renounce matrimony at their consecration, and to devote themselves entirely to the duties of their office. One point only was disputed, whether clergymen were to be merely prohibited from marrying, or whether even those who were married before their consecration should be required to separate themselves from their wives. At the Council of Nice several bishops proposed that the bishops, priests, and deacons who had received the holy consecration, should be directed by an express ordinance to give up their wives. But Paphnutius, bishop of Upper Thebais, contended that cohabitation with a wife was a state of chastity. It was sufficient, he said, according to the ancient traditions of the Church, that men in sacred orders should not be permitted to marry; but he who

had been married before his consecration ought not to be separated from his lawful wife. As it became the general opinion that a clergyman could not marry, it soon became the general practice to refuse consecration to married men. By this means uniformity was effected. As for the bishops, it soon became a matter beyond dispute. When monachism had become firmly established, and the monks were regarded with veneration on account of their vow of perpetual chastity, public opinion exacted from the secular clergy the same observance of celibacy. Epiphanius assures us that by the ecclesiastical laws celibacy was commanded, and that wherever this command was neglected it was a corruption of the Church. The Council of Elvira commanded all bishops, presbyters, deacons, and subdeacons to abstain from their wives, under penalty of exclusion from the clergy. In the Western Church celibacy was rigorously required. Pope Siricius, at the end of the 4th century, forbade the clergy to marry, or to cohabit with their wives if already married. At the same time the monks received consecration, which increased the conformity between them and the secular clergy still further, and indirectly obliged the latter to observe celibacy. The Emperor Justinian declared all children of clergymen illegitimate, and incapable of any hereditary succession or inheritance. The Council of Tours, in 567, issued a decree against married monks and nuns, declaring that they should be publicly excommunicated, and their marriage formally dissolved. Seculars, deacons, and subdeacons, who were found to dwell with their wives, were interdicted the exercise of spiritual functions for the course of a year. In Spain, where many priests refused to conform to the requirements of the Church, the bishops were ordered to enforce celibacy upon their abbots, deacons, etc., once a year in their sermons.

As in other points of discipline, in this also the Greek Church dissented from the Roman. The (Trullan) Council of Constantinople, in 691, in its 13th canon, declares: "We hereby forbid anyone to refuse the consecration of a priest or deacon on account of his being married, and cohabiting with his wife after he has requested consecration. We will by no means be unjust to marriage, nor separate what God has united." This regulation is still in force. Celibacy is indeed required of the bishops and monks, but priests and deacons, if married before ordination, are allowed to continue in this state. They cannot marry after ordination.

The Roman Catholic Church, then, has retained celibacy as an old apostolical tradition, to which she has added the rule not to consecrate married men unless the wife enter a religious order. As no one has a right to demand to be consecrated a priest, the Roman Church has, by this addition, violated no one's right. Her position, therefore, is expressed by saying that, profoundly convinced that an unmarried clergy is best suited to her work, she admits to her ministry only those who voluntarily engage to lead a celibate life, and as long as she finds a sufficient number of such candidates she refuses to hamper her work by the employment of others. While, however, the Church persevered in commanding celibacy, she had to struggle with the opposition of those who among the clergy represented corruption. A reformer appeared in Gregory VII., who, in order to reform the discipline of the Church, was obliged to encounter simony and licentiousness in some of the clergy. The former he checked by opposing the emperor's right of investiture, and he enforced the laws of celibacy by new regulations. In the Council of 1074, at Rome, he ordered that all married clergymen and all laymen who should confess to them, hear mass of them, or be present at any divine service performed by them, should be excommunicated. This met with much opposition, but in spite of that Gregory succeeded, as he was supported by the most ancient and most undoubted canons. After Gregory's death the Church continued in the same course. Still the question of celibacy has continued down to recent times to be the subject of fresh agitations and contests. All through the first half of the 19th century there were periodical attacks upon this rule of the Church, in which almost every Catholic country of Europe was represented. These movements have occurred alike within the communion of the Church and among secular and political bodies. They have usually been inspired by concern for the welfare of the Church and for the character and perpetuity of its priesthood, but no result has thereby been gained in any alteration of the ecclesiastical discipline.

The rule of celibacy has been more strictly observed in the Roman Catholic Church since the Reformation than it was before. The far greater number of the Catholic clergy have continued to respect it. Among the reasons sometimes urged against requiring celibacy in the clergy is the scarcity of men willing to devote themselves to a profession which calls for such strict self-denial. This, however, is said to be not true in point of fact, since statistics show a marked increase in the number of candidates for the priesthood at the present time.

Cell, the primary element of the bodies of plants and animals. A cell is a microscopic portion or bit of protoplasm (q.v.) either with or without a wall, and with usually, probably always, a nucleus. Cells are originally more or less spherical sacs, and the protoplasmic contents is the cell, that is, its dynamic portion. The cell is the morphological unit of the organic world. The size of cells varies, but they are mostly microscopic, the sperm cell (spermatozoon) being even less than 0.003 mm. in diameter. The egg-cell — for all unfertilized eggs are simple cells — may, as in that of the fowl, goose, or ostrich, be several inches in diameter. The largest unicellular organisms are the giant plasmodia of the *Mycetozoa.* While the free cells are spherical, when they are united into tissues they may by mutual pressure form polygonal or prismatic bodies, or may send out spindle or star-shaped branching processes, or a nerve-cell may send out a long, fine nerve-fibre.

History of the Cell Theory.—The term "cell" was first used in the 17th century by Hooker, Malpighi, and Grew in writing of vegetable anatomy. They had in mind small chambers surrounded by firm walls and filled either with air or fluid. The English botanist Brown discovered the nucleus. Schleiden then framed his cell theory, laying emphasis on the nucleus. While his view was somewhat erroneous,

Schwann applied Schleiden's views to the animal world, and the cell theory was spoken of as the Schleiden-Schwann theory. From their point of view the cell-membrane was regarded as most important for the function of the cell; but, after that, the conceptions as to the true nature of the cell completely changed. It was seen that the protoplasm was the essential part of the cell. It was observed that it owed its origin to a previous cell, a living mother-cell. Hence Virchow's aphorism, *Omnis cellula ex cellula.* Then followed the discovery of protoplasm (q.v.) by Dujardin, Mohl, Schultze, and others, so that now the cell is regarded as a lump or bit of protoplasm.

Nucleus.—This is the central specialized portion of the cell, and the part in which reproduction begins. The nucleus may vary in shape in each kind of cell. While usually spherical it may be oval, club-shaped, bent into a U, or be branched. It also varies much in size, sometimes forming almost the whole of the cell, but sometimes so small as to be found with difficulty, and only by employment of a special technique. The substance of which the nucleus is composed is distinguished from protoplasm, besides other characters, by its greater coagulability in certain acids (acetic and chromic).

Structure of the Nucleus, Chromatin and Chromosomes.— A portion of the nucleus reacts to certain staining-fluids (carmine, hæmatoxylin, and safranin); this is therefore called "chromatin" (by some "nuclein"). The other substance, which does not stain, or only under special conditions, is called achromatin or linin. The chromatin forms a honeycomb structure (by other authors regarded as a network or reticulum) filled with a nuclear fluid, bounded externally by a nuclear membrane.

The chromatin enters into close relations with a less stainable substance, the plastin or paranuclein, also sharply distinct from achromatin. In the nuclei of *Protozoa,* plastin and chromatin are usually intimately united, the latter being embedded in the plastin. Both of these substances are usually so closely and regularly distributed as fine granules on the reticulum that the entire nucleus appears to be uniformly chromatic. The mixture sometimes collects into one or more special bodies called the chromatic nucleoli. The nucleolus is usually a rounded body (Hertwig).

In the *Metazoa,* or many-celled animals, the plastin (apparently not the whole, but a surplus) is separate from the chromatin. Thus there occur, in the nuclei of many eggs, nuclei which contain, the one chromatin, the other exclusively plastin.

Significance of the Cell Nucleus.— It is now well known that the seat of the reproduction process is in the nucleus. It has lately become apparent that the nucleus determines the character of the cell, and, again, that it is also "the bearer of heredity" (see HEREDITY). Within the nucleus the chromatin is now supposed to control the functions of the protoplasm, and therefore is the bearer of heredity, while the achromatin is the seat of contractility, and as such plays a part in cell-multiplication (Hertwig).

The Centrosome.— In addition to the nucleus there frequently occurs a special body in the protoplasm, called the "centrosome." It is supposed to be a derivative of the nucleus, either a part of the achromatin which has left the nucleus; or a second nucleus which by degeneration has lost the chromatin and retained only the active nuclear substance, the achromatin. The centrosome functions as a specific organ of cell-division which controls both the division of the nucleus and that of the cell itself. See KARYOKINESIS; MITOSIS; PROTOPLASM; REPRODUCTION.

Consult: Hertwig, 'The Cell'; 'A Manual of Zoology'; Wilson, 'The Cell in Development and Inheritance.'

Cell, a small chamber; the dwelling of a hermit; a lesser or subordinate religious house dependent upon a greater, by which it was erected, and under whose government it remained. The apartments or private dormitories of monks and nuns are also called cells.

Cell, in mechanics. See PEAUCELLIER CELL.

Cell Electrical. See BATTERY.

Cella, the windowless hall or central apartment of a Greek or Græco-Roman temple. This was often divided into two chambers of unequal size; the naos, in which was the statue of the divinity for whose worship the temple was built, and the thesauros or treasury. The cella was formerly supposed to have been roofless, or partially roofless, but later scholars believe it to have been lighted only through the doors or by artificial light. In the larger temples the roof was internally supported by the rows of columns in the cella, frequently in two superposed ranges.

Cellamare, Antonio Guidice, än-tō'nē-ō gē-dē'chā thäl-yä-mä'rā, PRINCE OF, Spanish ambassador: b. Naples 1657; d. Seville 16 May 1733. He was educated at the court of Charles II. of Spain, and took a prominent part on the Spanish side in the war of Succession. In 1707 he was taken prisoner by the Imperialists, and detained five years in Milan. On obtaining his liberty he returned to Spain, and in 1715 was appointed ambassador extraordinary at the French court. Here, having entered into Alberoni's scheme, he became head of a conspiracy for supplanting the regent, Philip of Orleans, and appointing Philip V. regent of Spain and France. The plot was discovered, and Cellamare was marched off under a guard to the Spanish frontiers. He was afterward made captain-general of Old Castile, and held the office at his death. A romance of Vatout, entitled the 'Conspiracy of Cellamare,' gives an account of the conspiracy with tolerable accuracy.

Cel'lar-snail, a species of land-snail (q.v.) (*Zonites cellaris*). It has been introduced from Europe, and has become common in cellars, hot-beds, and gardens of the seaport towns along the Atlantic coast. The shell is small, much flattened, thin, and has a large umbilicus.

Cel'lardyke, Scotland, a village on the southeast coast of the county of Fife, between Anstruther-Easter and Kilrenny. It is an eastern extension of the former, but is united as a royal borough to the latter. The inhabitants are chiefly engaged in or connected with the fishing industry; the village contains three fishing-gear factories and also oil-skin works. Pop. 1,662.

Celle, tsĕl'lĕ, or **Zelle,** a town in Prussia. See ZELLE.

Cellier, Alfred, English composer: b. Hackney, England, 1 Dec. 1844; d. London 28 Dec. 1891. He was the son of a French father and an English mother and from 1855 to 1860 was a chorister of the Chapel Royal, Saint James. In 1862 he became organist of All Saints' Church, Blackheath; at 20 he directed the Ulster Hall concerts at Belfast, and in 1868 was organist of Saint Alban's, London. He conducted at the Prince's Theatre, Manchester, 1871–5; and at the Opera Comique, London, 1877–9. Besides much music for orchestra and piano he composed among other operas: 'The Tower of London' (1875); 'Nell Gwynne' (1876); 'The Masque of Pandora' to the words of Longfellow's poem (produced in Boston 1887); 'The Sultan of Mocha'; 'Dorothy' (1886); 'The Mountebanks' (1892). The last named work was produced a week after its author's death.

Cellini, Benvenuto, bān-vā-noo'tō chĕl-lē'-nē, Italian sculptor, engraver and goldsmith: b. Florence 1500; d. there 25 Feb. 1571. Of a bold, honest, and open character, but vain and quarrelsome, and impatient of encroachment and dependence, he was often entangled in quarrels which frequently cost his antagonists their lives. He himself incurred great dangers, was put into prison, and was saved only by his boldness and the powerful protectors whom his talents as an artist procured him. His autobiography is a production of the utmost energy, directness, and racy animation. The vanity and self-satisfaction displayed throughout the work are excessive and highly amusing. It not only contains a very full information respecting his life and professional pursuits, his amours and hatreds, his passions and delights, his love of art, his extravagances, his self-applause and self-assertion, and describes all ranks of persons with whom he was connected during his strange career, but furnishes a very lively and doubtless a tolerably accurate picture of the state of society during the 16th century. This work has been translated in a masterly manner by Goethe into German. There are also English translations, Nugent (1771), revised by Thomas Roscoe (1822); and Symonds (1887). Among his other writings the most important are 'Due Trattati uno intorno alle Otto Principali Arti dell' Oreficeria l'altro in Materia dell' Arte della Scoltura' (best edition 1731). His 'Opere' were published at Florence in 1843. See Symonds, 'The Renaissance in Italy' (1885); Leader Scott, 'Sculpture, Renaissance and Modern' (1886).

Cell'ites, or **Alexian Brothers,** a religious order, so called from their patron saint Alexius, and from *cella,* tomb, from the fact that their life often leads to an early grave. The brotherhood arose in Mechlin about 1300, to check the ravages of the "black death," and soon spread through Germany, Brabant, and Flanders. At first the Cellites were merely a pious society, intended to harbor the poor and indigent free of charge, to serve the sick, and bury the dead. In 1469 they were organized as a religious order, and, favored by the popes, they established houses in many parts of Europe. In the United States, they have a hospital in each of the following cities: Chicago (founded in 1861); St. Louis (1869); Oshkosh, Wis. (1880); and Elizabeth, N. J. (1893).

Cel'luloid, an artificial substance extensively used as a substitute for ivory, bone, hard rubber, coral, etc., having a close resemblance to these substances in hardness, elasticity, and finish. It is composed of cellulose or vegetable fibrine reduced by acids to gun-cotton. To this, camphor is added, with the required coloring matter, and the mixture, after being condensed in cylinders, is then molded by heat and pressure into various useful and ornamental articles.

Cel'lulose, a chemical substance closely allied to starch, which occurs in all plants, and is the essential constituent of the walls of the cells. It is especially prominent in young plants, and with age it becomes more or less completely converted into lignin and other analogous products. Cotton fibres are composed almost entirely of cellulose, and such other substances as they do contain are readily removed by treatment with alkalis, alcohol, ether, etc. Cellulose has the chemical formula n ($C_6H_{10}O_5$), and is therefore a carbohydrate. In some respects, it is widely different from starch, but in others it resembles starch very closely. It may be said, in general, that the chemistry of all the substances that are intimately related to the starches, gums, and sugars is still very imperfectly known. Cellulose is specially remarkable for its insolubility and its chemical stability. It may be decomposed and caused to enter into combination with other bodies, but the only solvent known, which will dissolve it without destroying its chemical identity, is an ammoniacal solution of cupric oxide. From its solution in this menstruum, cellulose may be again precipitated in apparently unchanged chemical form, though in a physically amorphous condition. Unglazed paper (which is nearly pure cellulose) is converted, by the action of strong sulphuric acid, into a parchment-like substance that is known as vegetable parchment, or parchment paper. By the action of a mixture of strong nitric and sulphuric acids, cellulose is converted into a sort of nitrate, which is commercially known as gun-cotton (q.v.). Collodion is a solution of gun-cotton in a mixture of ether and alcohol. By the prolonged action of sulphuric acid cellulose is partially converted into glucose, and various other reactions are also known with sulphuric acid according to the conditions under which the experiment is made. When strongly heated out of contact with the air cellulose is destroyed, with the formation of acetic acid, methyl alcohol, and many other products. These transformations occur in the distillation of wood in the manufacture of wood alcohol. (See ALCOHOL.) It is probable that true cellulose occurs only in plants; but a substance that is closely analogous to it, and which is believed by some authorities to be identical with it, is found in the tissues of ascidia and other molluscous animals.

Cellulose as prepared from corn pith is now used to a considerable extent in ships of war, to prevent the entrance of water through shot-holes. For this purpose it is disposed within the steel hull along the water line, in the form of a belt some three feet in thickness. For several years a packing of cocoa fibre was used in this

way, but corn pith is now preferred, and is used on the Kearsarge, Alabama, Kentucky, and Illinois. The great superiority of the corn pith lies in the fact that as soon as the water reaches it the pith swells and automatically closes the shot-hole.

Celma, a Thessalian woman, who, with her husband, Celmus, was changed into adamant for denying the immortality of Jupiter.

Celman, Miguel Juarez. See JUAREZ, CELMAN.

Celsius, sĕl'sĭ ŭs, the name of a Swedish family, several members of which attained celebrity in science and literature: 1. MAGNUS CELSIUS: b. in the old province of Helsingland, 1621; d. 1679. He became professor of mathematics in the University of Upsal and published two works on the antiquities of his native province and was the discoverer of the Helsing runes. Besides mathematics and archæology, he cultivated poetry with some success, and was so skilled in practical mechanics that he himself made all the scientific instruments he required in his astronomical observations, etc. 2. His son, NILS CELSIUS: b. 1658; d. 1724; also filled the mathematical chair in Upsal University. 3. OLAF CELSIUS, another son of Magnus: b. 1670; d. 1756. He early became famous as an earnest student of the Oriental languages and of botany. He was successively appointed to the chairs of Greek, Oriental languages, and theology, and filled the office of provost of the cathedral at Upsal. He devoted a good deal of attention to the study of runology, and was among the first to recognize the genius of Linnæus, whom he liberally patronized. In 1745–7 he published his voluminous work 'Hierobotanicon,' a description of all the plants mentioned in the Bible. 4. ANDERS CELSIUS, son of Nils Celsius, and the most distinguished of the family; b. 27 Nov. 1701; d. 1744. After being appointed professor of astronomy at the University of Upsal, he traveled in Germany, England, France, and Italy; and in 1736 took part in the famous expedition that was undertaken by Maupertuis, Clairaut, Camus, and others, for the purpose of measuring a degree of the meridian in Lapland. For his services in this expedition he received a pension from the French king. He is best known at the present day as the constructor of the Centigrade thermometer. 5. OLAF CELSIUS the younger, son of the Orientalist and naturalist, and cousin of the preceding: b. 1716; d. 1794. He became Bishop of Lund, and devoted himself to history and poetry. His principal historical works are: 'Ecclesiastical History of the Kingdom of Sweden'; 'History of Gustavus I.'; 'History of Erik XIV.'.

Cel'sius Scale, the Centigrade thermometric scale. The name is from that of the inventor, Anders Celsius, who about 1741 attempted the precise graduation of thermometers. He took the melting-point of ice as 0°; and the boiling-point of water, under standard atmospheric pressure, as 100°. See THERMOMETER.

Cel'sus, pagan philosopher, an antagonist of the Christian religion in the second century. He is believed to have been the same Celsus, friend of Lucian, to whom is inscribed Lucian's satirical sketch of the life of the noted impostor and pseudo-thaumaturgus Alexander of Abonotichus, entitled 'Pseudomantis.' No work of Celsus has come down to us in its integrity or in its original form, but his 'True Discourse' is in substance preserved for us in the eight books of Origen's computation of the arguments brought by Celsus against the truth of the religion of Christ: Origen quotes textually long passages from the 'True Discourse' in his work 'Against Celsus.' From these passages it is seen that Celsus had accurate knowledge of the religious creed and practices, both of the Jews and Christians, and he skilfully puts in the mouth of a Jew his criticism of the life of Jesus as told in the gospels. Celsus himself appears to have been an epicurean and a scoffer at the supernatural, while his Jew is a firm believer in miracle, but for all that he cannot accept the gospel stories. He rejects the doctrine of the Incarnation of God, and reports a scandalous story of an amour which he offers as a substitute for the evangelists' narrative: and the fact Origen quotes the passage containing this shockingly blasphemous suggestion (as it must have been regarded by him) is evidence that the Christian polemist is dealing fairly with his antagonist. According to Celsus Jesus once visited Egypt and there learned the art of the jugglers; in his own country he easily won reputation as a wonder-worker, even a god. By his jugglery he might have made the multitude present at his immersion by John in Jordan believe that they heard a voice from heaven. If he was God, he would have made a better choice of apostles: why did he choose Judas? The story of the resurrection is self-contradictory. His death by crucifixion is undisputed and was a fact of public notoriety; if he rose from the dead, why did he not make that fact equally notorious and public? With such objections Celsus attacks the Christian faith in the first half of his work; in the second half he speaks in the person of a Grecian philosopher. Whatever is true and good in the Christian system exists already in the schools of philosophy: therefore let the Christians abandon their narrow sectarianism and separatism, and combine with all good and wise men in upholding the principles of good government. Celsus then advances philosophical arguments against the credibility of the Christian mysteries, in particular the Incarnation. God cannot assume a mortal body either in reality or in appearance only: not really, for that would be contrary to his nature; not in appearance, for that would be a fraud. But the idea of an incarnation of God is absurd: what could be gained by an incarnation? Certainly no advantage for God; but neither for men: do men know God better for seeing him in bodily form? Did God a little while ago waken from sleep and resolve to save a few men from sin, leaving the mass of mankind to go down to hell?

Celsus, Aurelius, or **Aulus Cornelius,** Latin writer on medicine who lived, probably, under the reigns of Augustus and Tiberius. He has been called the Roman Hippocrates, because he imitated the Greek physician, and introduced the Hippocratic system into Rome. He also wrote on rhetoric, the art of war, and agriculture. He is, however, best known as a medical writer. His style is elegant, and though concise, is very perspicuous. His work on medicine is an inexhaustible source from which other authors have

drawn materials. Eighty editions of his eight books 'De Medicina' have appeared; the first at Florence (1478). There is an English translation by Grieve (1756), and an edition, Latin and English, by Lee (1831). The edition by Védrènes (Paris 1876) contains a French translation.

Celtes, tsel'tes, **Konrad,** German humanist: b. 1459; d. 1508. His most celebrated work is a volume of 'Odes' (1513). He did much to promote the study of the classics, and wrote his own poems in Latin.

Celtiberi, a people of ancient Spain, supposed to have arisen from a union of the aborigines, the Iberians, and their Celtic invaders. Various limits have been assigned to their country, which included probably all the north of Spain as far south as the sources of the Guadalquivir. Hannibal subdued the Celtiberi, and they afterward passed under the Roman yoke. They revolted in 181 B.C., and were subdued by Tiberius Gracchus 179 B.C. Two struggles for independence followed, called respectively the first Celtiberian Numantine, and the second Celtiberian or Sertorian wars, in the latter of which they were finally vanquished, and after 72 B.C. do not again appear in history.

Celtic Church, the designation specially appropriated to the Christian Church founded in North Britain among the Celtic population by Ninian, Columba (Columcillé) and other Celtic apostles. Of these the most notable is Columba. He was a native of Ireland and a scion of the royal line of Niall and a kinsman of Conal, king of Ailbe or Albin, later called Scotia. Columba and all his companion missionaries to the Scots and Picts were monks, and the churches he and they founded, whether on the mainland or in the Western Isles, were essentially monastic in their form of government. In the Holy Isle, Iona, called also after the name of the Gælic apostle, Hy-Columcillé, which was the metropolis of Celtic or Gælic Christianity, Columba was arch-abbot of all the monastic communities and in effect, though not in order or title, bishop, primate and patriarch of that whole province of the Church Catholic. The system of Church government was not diocesan, and though there were bishops in Scotia they appear to have simply exercised their spiritual and sacramental powers in conferring orders and performing other rites. The government of the Celtic Church appears to have been administered only by the arch-abbot and his subject abbots. The Church spread, not by the erection of parishes, but by the planting of monastic houses, and a monastic community usually consisted of members of a clan, thus of kinsmen one of another. Columba himself had among 11 successors in the primacy 9 who were his kinsmen. These Gælic monks lived under a rule drawn up for them by men of their own race, but in imitation of the early rules of the eastern cenobites. The chief precepts of the Celtic monastic rule were poverty, chastity, obedience, and hospitality. The day of Easter was observed according to the Eastern cycle, and in this the Celtic Church of Scotland was at variance with the Latin Church. They had also some peculiarities in the mode of administering baptism. Columcillé came among the Scots in 563, being then aged about 40; he lived till the close of the century. From the end of the 6th to the end of the 8th century Hy-Columcillé or Iona was one of the most famous sanctuaries of western christendom; the Norse pirates laid Iona waste with fire and sword in 795; again in 802; and the ravages were repeated often afterward. Toward the end of the 11th century Margaret, queen of King Malcom Canmore, introduced into the Celtic Church of Scotland the usages of the Church of Canterbury in the observance of Lent and of Easter, in the celebration of the mass and other points of ritual; also she procured to be forbidden marriages between persons related by affinity. In these reforms she was aided by Lanfranc, Archbishop of Canterbury. The only monument of the ancient Celtic Church still extant in Scotland is (the insignificant ruins in some of the Hebrides not reckoned) the chapel raised in memory of the good Queen Margaret on the castle rock in Edinburgh. See IONA.

Celtic Languages, The. These constitute one of the seven or eight main groups comprised in the great family of Aryan or Indo-European languages: thus the Celtic is a sister language of Sanskrit, Old Persian, Armenian, Slavonic, Lithuanian, etc., as well of the Latin, Greek, Teutonic, and of the dominant modern languages of Europe. Within historic times Celtic speech prevailed throughout western Europe. As late as Cæsar's time it was the language of northern Italy, then known to the Romans as Gallia Cisalpina or the land of the Gael south of the Alps; and at that time Celts, Gaels or Gauls occupied the whole of the region lying west of the Rhine and part of Switzerland, besides the British Isles. But in time Celtic speech was wholly detruded from its seats throughout western continental Europe except the western extremity of France, and in the British Isles at the time of the Norman conquest it had disappeared from the whole southern half of Britain except Wales and Cornwall, and survived only in northern Britain, Ireland, Man and other isles of the Britannic group.

The language of these Celtic peoples, as well in antiquity as at the present time, presented dialectic differences sufficient to warrant a division of their common speech into two groups, the Gælic, now represented by the Celtic speech of Ireland, Scotland, and Man; and the Cymric or Kymric, represented by the Celtic speech of Wales and Brittany. Of these two groups the Cymric has best withstood the intrusion of alien speech, whether Romanic or Teutonic; and to this day a Cymric dialect of Celtic is the language of the people of Brittany and Wales; while of the provinces of the Gælic tongue, Scotland, with a population of about 4,500,000, has not in the mainland or in the isles more than 300,000 persons who speak or understand Gælic; and in Ireland in 1900, when the population was 4,500,000, the speakers of Gælic were but 700,000, a decline of 50,000 from their number 10 years before. This decline is due to the large emigration in the last few years from the western province, the last foothold of Gælic in Ireland. But the people of Ireland and the children of Ireland abroad are now making a concerted effort to resuscitate the ancient speech of their race and to make it again the home-speech of the people, concurrently with English. High hopes are entertained of the success of this movement, which purposes a revival, not only of the Gælic speech but of Celtic art, and music,

and literature. It is a struggle for the supremacy of Gælic ideals in the spiritual life of the people. In 1902, in a convention of the Gælic League in Dublin, 475 branches of the League were represented. The membership of the branches amounted to 50,000. Gælic is now taught in 1,600 schools in Ireland, and there were that year several Gælic periodicals, and nearly every newspaper in Ireland had a column or a page printed in Gælic. There were 600 Gælic literary and musical compositions entered in a prize competition held at Dublin during the convention, to which resorted thousands of visitors from all parts of Ireland and from abroad. Such competitions have long been held by the Cymry of Wales.

The Celtic speech of the Britons, now represented only by the Cymric of the Welsh, was formerly the language of the inhabitants of Cornwall and of Strathclyde also, and it is closely akin to the Armoric, or language of Brittany. In the last quarter of the 18th century died the last person for whom the Celtic speech of Cornwall — the Cornish — was a living language. Very scanty remains exist of the poetry of the Celtic inhabitants of Cornwall. What treasure of poetical compositions or of mythic history may have been held in the memory of their bards or of the people is lost, with the exception of five or six poems in the vein of the mysteries of mediæval times, namely: The 'Poem of the Passion,' a versified account of the life of Jesus Christ in the "holy week" — it is probably of the 15th century; 'Ordinalia,' a dramatic trilogy, the first member of which recounts man's history from the creation to the deluge, and then presents the story of Moses, of David, and of the temple of Solomon. The poet or dramatist has no regard for chronology, and makes the temple the theatre of the martyrdom of the Christian virgin Maximilla by the bishop in charge. The second member of the trilogy represents the life of Christ from the temptation by the devil to the crucifixion. The third is a free version of the story of the resurrection and ascension of the Lord, with a supplementary act representing the death of Pilate as told in mediæval legends. Dramatic unity is obtained by interweaving a myth regarding the wood of the cross, a favorite extravaganza of mediæval fancy. Another play is 'The Life of Saint Meriasek' written in 1504, a jumble of historical and traditional personages and occurrences crowded together with no regard whatever to chronology or probability or even possibility. But in the tangle are found some passages of considerable literary merit. Besides these dramatic pieces there survive a few songs, proverbs, epigrams, and the like, and the tale of 'John of Chy-an-Hur,' a favorite folk-tale.

Welsh, or Cymric (Kymric), the language of the Cymry or Kymry, is both a living language and has a literature of considerable volume and of no mean literary value. A few of the peculiarities of Cymry speech which distinguish it from the kindred speech of the Gæl, as regards the phonology, are that in Welsh p (labial) answers to c (c hard, equal to k) in Gælic; *e.g.*, Welsh *pren*, tree, *petguar*, four, *plant*, progeny, answer to Gælic *crann*, *cethir*, *cland*, respectively; or, Welsh *nep*, *map*, *paup* to Gælic *nech*, person, *mac*, son, *cach*, each, respectively. Even proper names from Gælic sometimes undergo this change on coming into Cymry speech: *e.g.*, the celebrated Irish saint, Kiaran (Ciaran, the c being always equal to k) is in Cymric Piaran; but conversely the word *Pasch* (Pascha, passover) is in Gælic *casg*, and Latin *purpura*, allied to Gr. *pyr* or *pur* and to Eng. *fire*, is in Gælic *corcur*. Answering to Gælic *iasg*, which is Gr. *ichthys* and Eng. *fish*, Welsh has *pysg*, as Latin has piscis (c=k). In Cymry the sibillant *s*, preserved in Gælic, Latin, etc., is often displaced by *h*, as is the case in Greek also, *e.g.*, Eng. salt, Lat. *sal*, Gæl., *salann*, but Welsh *halen*, Gr. *hals*. Other differences of this sort between Welsh and the sister language Gælic might be instanced, but these suffice.

Many Welsh MSS. from early times are extant — poems and prose romances chiefly, and they relate to the period of the Roman occupation, of the wars with the Sassenach, and the wars with the kindred Gæl, or they are collections of proverbs or are religious poems. Probably the most ancient of these compositions do not date from an earlier period than the 13th century, though doubtless they are based on and inspired by bardic and other pieces retained through generations in folk-lore. Among the Cymry, as among the Irish Gæl, the bardic order was recognized as a sort of priesthood and was held in the highest respect, the bard enjoying many special privileges. Thus, in the Laws of Howel Dda (Howel the Good), composed in metre according to primitive usage in all lands, the provisions made for the bard are thus expressed:

> In case of fighting the Bard shall play the 'Monarchy of Britain' before the battle.
> His land shall be free; he shall have a horse from the King.
> He shall have a harp from the King and a gold ring from the Queen. The harp he shall never part with.

Most of the ancient poetry is attributed to the bards Taliessin, Aneurin, Llwywarch, Hen, and Myrddin (or Merlin).

For many hundred years the Cymry in Britain were engaged in a deadly struggle with invading races — the Romans, the Gæl, both Scots and Irish, the Sassenach, the Normans, and the English, being pressed back to the West till finally they were conquered and "pacated" in the time of Henry VII. All this time the Cymry bards and chiefs and people kept alive the lamp of learning and cherished the highly imaginative poetry of their seers; and it is a curious fact that among the remains of their early literature still extant are no fewer than 30 treatises on Cymry grammar and prosody, the most notable of these dating from about 880. It was revised in 1200. The authorship of most of the ancient books as well as the dates are problematical, but the dates assigned by the general consent of Welsh scholars to the principal poets are: Aneurin, 510–60; Taliessin, 520–70; Myrddin or Merlin, 530–600. Some of the poems attributed to these three and others are undoubtedly spurious, and so proved to be on chronological grounds. Thus, though the three poets named lived *ex hypothesi* not later than the beginning of the 7th century, in the works attributed to them are found allusions to theological conceptions and use of theological terms which were unknown till four or five centuries later. The Bible was translated into Welsh in the 16th century by Bishop Morgan, and that was doubtless a powerful agent in preserving in its purity

among the common people their ancient mother tongue.

The Gælic speech of Ireland and Scotland has a very peculiar phonology, specially in the "aspiration" and "eclipsing" of consonants. This aspiration, as defined by O'Donovan, is "the changing of the radical sounds of the consonants, from being stops of the breath to a sibilance, or from a stronger to a weaker sibilance." But however correct that definition may be, it gives not to one who has no acquaintance with Gælic any conception of the effect of what is here called aspiration. A few examples will better show what this peculiarity of Gælic speech is. In Irish Gælic, and in Scots Gælic also, though perhaps some differences exist between the two dialects in this respect, the consonants that are subject to this phonetic change are b, c (*always* = k except when "aspirated"), d, f, g (always hard with the same exception), m, p, s, and t. The aspiration is denoted, whether in MS. or in print, by a point over the letter, *e.g.*, ċ, or by a h after, *e.g.*, mh. The effect of aspiration is to change the b and also the m (bh, mh) to v or w, or to a sound between v and m; example, *ard*, high and *bearna*, gap, give not *ard-bearna* (ardbarna), but *ardbhearna* (Ardvarna). Similarly Baile-an-mullaich, the *m* being changed to mh, with the sound of *w* becomes in pronunciation Ballinwoolly: the word is the name of a town and is made up of *baile*, town, *an*, of the, and *mullaigh*, possessive case of *mullach*, summit. The aspirated *d* and *g* are in sound about equivalent to *y* in *year*; example: Annayalla fairly well represents the pronunciation of Eanaigh-gheala. When aspirated, *f* is not sounded at all; example: Cnoc-an-fhraoigh, pronounced Knocan-ree. P aspirated is equal to f: baile-an-phoill, pronunciation, Ballinfoyl. The s and t aspirated are equal to h; example: drum-shamhuin is Drumhawan, and Drumhirk fairly represents the pronunciation of drumthuirc. To illustrate the process of eclipsis, "suppression of the sounds of certain radical consonants by prefixing others of the same organ" — a process to which are subject the consonants *b, c, d, f, g, p, s, t*, each of which has a special eclipsing letter of its own, one illustration, the eclipsing of *b* by *m*, must suffice: the place-name mullanamoya (or as it is written, Mullaghnamoyagh) represents Mullach-na-mboitheach: here the representation of the sound of the word in English is almost as cumbersome as in the Gælic.

Nearly all the remains of ancient Gælic literature, and they are comparatively very voluminous and intrinsically valuable, are of Irish origin, the documents written in the Scots and the Manse dialect being of little or no importance. There exists no evidence that in the Middle Ages there were anywhere, in Scotland, schools or academies or any body of scholars, bards or legists such as existed in Ireland as early as the 6th century; and no document in Gælic or in Latin, and of Scotch origin has come down to us of earlier date than the 'Book of Deer,' which appears to have been penned in the 9th century, and which contains only "a few notes or memorials" in Gælic, while the body of the book is in Latin containing the gospels in Jerome's version. The Gælic poetry of Scotland, as preserved in the memory of the people of the highlands and collected in recent times are the only literary monuments extant of ancient Scotch bardism. The following verses are found in one of those collections. They show the "aspiration" of consonants as in the Gælic of Ireland.

Tamhull mòr, mac sheann Tamhuil,
(Great Taval, son of old Taval)
Cha ruigeadh a'mhuir mhòr a ruinse,
(The great sea wouldn't reach his middle)
Cha thàrudh e mach, 's cha thàradh e steach,
(He couldn't get out and he couldn't get in,)
'Us 'n uair a bhitheadh e 's a bheul fodha,
(And when he lay down on his face)
Bhitheadh a dhruim a' sgriobadh an athar.
(His back would be scratching the sky).

There are extant fragments of Gælic writing penned in the 8th and 9th centuries, namely Gælic glosses appended to Latin MSS. Among these the canons of an Irish synod held in 684 and some passages from a sermon in Gælic. In libraries in many continental European countries are many Gælic texts of early times; but in the library of Trinity College, Dublin, and in that of the Royal Irish Academy, in the Bodleian at Oxford, and in the British Museum, are treasured monuments of a very copious Irish Gælic literature, by good fortune rescued from the destruction which has overtaken the great mass of Ireland's literary product during the "dark ages" of European history. According to their contents these MSS. are classed as histories, annals, biographies, pedigrees, mythological stories, fairy tales, hero stories, religious and devotional writings, lives of saints, lyric poetry, satire, many of the hero tales and myths being in poetical form. Treatises on law (Brehon law) are numerous and there are also medical treatises and some works on natural science. As among the Cymry, so among the Irish Gæl, the bards and the possessors or professors of the liberal arts and of the *arcana* of science human and divine, were a privileged class. As early as the 6th century the liberal professions were well organized, and the schools of Ireland were already sending out graduates of *Ecna, Filidecht,* and *Fenechas*, wisdom (or philosophy), poetry and divination — the schools of the *Filidecht* were "schools of the prophets" — and law.

Ireland became in the darkest of the Dark Ages, the 9th, 10th, and 11th centuries the sanctuary of learning, and to her schools students flocked in thousands from Gælic and Saxon Britain and from the continent, while Irish missionaries carried abroad to the banks of the Rhine, the Elbe, and the Danube, and to the Swiss in their mountains, with the cross, the lamp of learning. The profession of a Fili being a highly privileged one, and the Fili being numbered by thousands, the poetical and imaginative literature of Ireland was exceedingly voluminous, and though most of it has perished, a very considerable portion remains. Of special value are the numerous glossaries, which have been the means, in the hands of modern scholars, of reconstructing the vocabulary of the language. It is estimated that were the words of all the glossaries collected they would add 30,000 to the words contained in the printed dictionaries of the language. In one of these glossaries, dating from before the year 903, is seen an essay in comparative linguistic, Gælic words being traced in their relations to the Greek, Latin and Hebrew, the British and the Norse. Very numerous are the remains of Gælic historical or annalistic writings, and of biography, especially lives of saints: there are the annals

compiled before 1088 by an Abbot of Clonmacnoise; the so-called 'Annals of Ulster,' collected toward the end of the 15th century; the 'Annals of the Four Masters,' a compilation made indeed as late as the first half of the 17th century, but which embodies a great number of annals dating from much earlier periods, and which are now lost. The hero-tales relate mostly to the earliest period of which the memory was retained in the traditions of the Gælic race — the times of the invasion of Cymric Britain and of Caledonia by the Gæl of Eire or Erin, or to the wars at home with the tribes known as Nemed's people (Nemesians), Fomorians, Firbolgs, Tuatha, DéDanann, all of them rivals of the Milesian Gæl. To the legendary story of these wars belong the mythic heroes Finn MacCumhaill (son of Cumhall); Finn's son Oisin (the Ossian of Scots Gælic, as he is also of Irish Gælic myth); Niall of the Nine Hostages, a figure that stands upon or within the threshold of veridical history; he met his end in an invasion of Cymric Britain in 405. Of other extant poetical compositions founded on the legendary or the real history of the times between the 5th and 11th centuries are: A metrical life of St. Patrick by Fiacc, a bishop; an elegy on the death of the renowned St. Columcillé or Columkill, apostle of the western Scots (d. 597): the antiquity of this elegy, the extant copy of which was made about 1100, is proved by the fact that its language was in the 11th century so obsolete that it had then to be glossed and accompanied by grammatical notes. Of this class of legendary or historical poems there is a long list. Prose romances of history came into vogue in the 11th century: in these are glorified the deeds of the Gælic heroes of the long struggle with the Danes or Norsemen who for 200 years had been making settlements on all the coasts of Ireland: in them was chiefly celebrated the battle of Clontarf, 23 April 1014, in which a great and decisive victory was won by King Brian Boroihme (pronounced borúĕh) — Brian of the cow tribute. There are in collections of Gælic MSS. treatises on the medical art — an art which appears to have been hereditary, in certain families, who assumed as surname a word denoting the art or its professors, for example, O'Liagh (pronounced oléĕh), equivalent to leechson or descendant of the leech; O'Hiceadha, O'Hickey, descendant of the healer. Treatises on the Brehon law or Gælic system of jurisprudence are numerous, the MSS. dating from the 14th and 15th centuries.

Celtic Literature. See CELTIC LANGUAGES.

Celtic Peoples. See CELTS.

Celtis, a genus of trees of the natural order *Urticaceæ,* closely related to the elm. *C. australis* is the nettle-tree. See NETTLE-TREE.

Celts, or Kelts, the earliest Aryan settlers in Europe according to the common theory. They appear to have been driven westward by succeeding waves of Teutons, Slavonians, and others, but there are no means of fixing the periods at which any of these movements took place. Herodotus mentions them as mixing with the Iberians of Spain. (See CELTIBERI.) At the beginning of the historic period they were the predominant race in Britain, Ireland, France, Belgium, Switzerland, north Italy, Spain, and elsewhere. The Romans generally called them Galli, but also Celtæ. They appear to have reached the zenith of their power in the 2d and 3d centuries B.C. Some tribes of them, overrunning Greece, crossed over in 278 B.C. to Asia Minor, and subsequently the name of Galatia was given to the country where they settled, from their name in Greek — *Galatai* (*Keltoi* being also used). They finally went down before the resistless power of Rome, and either became absorbed with the conquering races or were cooped up in the remotest parts of their former domains. At an early date the Celts divided into two great branches, speaking different though allied languages. One of these branches is the Gadhelic, Goidelic, or Gælic, represented by the Highlanders of Scotland, the Celtic Irish, and the Manx of the Isle of Man; the other is the Brythonic or Cymric, represented by the Welsh, the Cornish, and the inhabitants of Brittany. The Cornish dialect is now extinct. The sun seems to have been the principal object of worship among the Celts, and groves of oak and the remarkable circles of stone, commonly called "Druidical Circles," their temples of worship. Celtic art is known to us chiefly in the many ornamented articles in bronze and other metals which have been preserved, and in several splendidly illuminated manuscripts of the gospels. The earlier specimens are characterized, among other things, by a predominance of elliptic curves and diverging spirals, and their style seems to have been of purely British origin and use. The introduction of Christianity led to a great advance in the ornamentation of metal and other articles, but the chief relics of Christian Celtic art are the magnificent manuscripts above referred to. Their dates range from the 7th to the 9th century, and the finest of them are the 'Book of Kells' (Trinity College, Dublin) and the 'Lindisfarne Gospels' (British Museum). See also ETHNOLOGY; GAEL; GAUL; IRELAND; PHILOLOGY; SCOTLAND; WALES.

Bibliography.— Logan, 'The Scottish Gael' (1855); Pritchard, 'Eastern Origin of the Celtic Nations' (1857); Thébaud, 'The Irish Race' (1873); Beddoe, 'Races of Britain' (1885); Roemer, 'Origins of the English People' (1887); Brinton, 'Races and Peoples' (1890); Ripley, 'Races of Europe' (1899); Rhys and Jones, 'The Welsh People' (1900); Deniker, 'The Races of Man' (1900).

Celts, sĕlts, ancient weapons or implements of stone or bronze, found over nearly the whole surface of the earth. The derivation of the word is uncertain, though a very likely origin is to be found in the Welsh cellt, meaning "flint." There seems to be no reason whatever to connect the word with the name of the Celtic people. Stone celts are popularly believed in many countries to be thunder-bolts. Hence in different parts of Great Britain they are known as "thunder-axes," "thunder-bolts," etc.; and they are still, or have been known by similar names in France, Germany, Italy, Denmark, Greece, Japan, Burma, and numerous other places. Even the learned did not refuse their countenance to this vulgar error. Connected with this curious belief as to the origin of these stones, there were various superstitions almost equally widespread, such as those regarding their efficacy against lightning and their medicinal virtues. Somewhat similar beliefs were connected with the equally common

flint arrow-heads. Stone celts are found in the form of hatchets, adzes, or chisels. Some are only about an inch in length, while others approach two feet. The most common length is from six to eight inches, and the breadth is usually about one half or one third of the length. The materials of which they are made are flint, chert, clay-slate, porphyry, various kinds of greenstone and of metamorphic rocks, and, in short, any very hard and durable stone. Some are found merely chipped into shape; others have the edge ground and polished, although the other parts are merely chipped; and there are others which have the whole surface ground and polished. These stone celts belong to the Stone Age of archæologists, the ruder class being regarded as taking their origin in the earlier or Palæolithic Period, the more perfect in the later or Neolithic Period; while the bronze celts belong to the much more recent Bronze Age. Celts that are merely chipped appear to be more common in flint than in any other material. Two good reasons are given for this: first, that most other stones are more easy to grind than flint, and second, that it is more easy to give the proper form to flint than to almost any other stone merely by chipping.

There were two chief methods by which stone celts were attached to their handles. One was to insert the celt tightly in a hole made in the handle. The other was to insert the handle in a hole in the celt. Celts which have such holes to admit the handle are called perforated celts, and many axe- and hammer-heads have been found of this form. Sometimes, instead of a hole being cut right through the handle for the admission of the stone, there was merely a socket made in the wood, in which the celt was firmly fastened by means of some kind of binding. Instead of wooden handles, stags' horns seem often to have been used, and such are sometimes found with sockets at the end, evidently intended for the reception of small celts.

At various places remains have been discovered which indicate pretty clearly that at these spots the manufacture of celts was anciently carried on. Evidences of the existence of such manufactories are to be seen in the neighborhood of the Pfahlbauten of Moosseedorf in Switzerland; at the confluence of the Leochel and the Don in Aberdeenshire; at Cissbury, near Worthing; at Grime's Graves, near Brandon; at Spiennes, near Mons, in Belgium, and many other places. At the last-mentioned place the manufacture was carried on on a very large scale, and the shafts and galleries which were excavated in order to procure the flint necessary for the manufacture are still to be seen. Sometimes, however, the manufacture was carried on at places where the flint or other material out of which the celts were made was not to be had; such, for example, as the one mentioned in Aberdeenshire, and this proves flint to have been among the earliest articles of commerce. The blocks of flint were evidently imported as raw material to those manufactories, and then exported again in the form of manufactured celts. The remains found at these ancient manufactories leave little doubt that the process of manufacture must have been much the same as that by which gun-flints are still manufactured.

Bronze celts belong to a later period than stone ones, and are not so numerous. Some stone celts, however, have been found along with bronze celts in such a manner as to show that stone celts were still used when the method of working bronze had been discovered, a circumstance that need not be wondered at. Bronze celts are not found so large as the largest stone celts, the largest bronze celt being under 12 inches; but the average size of a bronze celt is about the same as that of a stone.

Stone celts are also found in various parts of the United States, flint and obsidian being largely used in the manufacture of cutting instruments. (See MOUND-BUILDERS.) On the subject of stone celts, consult Evans, 'Ancient Stone Implements of Great Britain.'

Cembra Pine, a fine conifer (*Pinus cembra*) of central Europe and Siberia, having edible seeds and yielding a turpentine called Carpathian balsam. "Swiss stone pine" and "Siberian pine" are variant names. The fruit is known as "cembra nuts."

Cement. A cement is any compound which, under certain conditions, is plastic and under others develops tenacity and can be used for holding together various materials; hence glue, lime, asphaltum, mucilage, and solder are cements. By far the most important class of cements structurally and commercially are the hydraulic cements, mixtures of lime, silica, and alumina that have the property when mixed with water to a paste of cohering or setting and finally becoming stone hard, even under water. The hydraulic cements may be divided into four classes based on differences in the materials used. The setting is probably due to the same general chemical reactions in all hydraulic cements, the lime uniting with the alumina and silica to form hydrous calcium silicates and aluminates. The quickness with which these reactions take place vary, the composition of the original materials and the differences in the methods of manufacture being the controlling factors. Quick-setting cements may become hard in a few hours, while some slow-setting cements require many months to reach their maximum tenacity.

The four classes of hydraulic building material above mentioned are: (1) *Hydraulic lime* made from a limestone containing a small proportion of clay (8 to 10 per cent) by burning at a low temperature and slaking the burned rock with water. (2) *Hydraulic* or *natural-rock* cement made from a limestone containing a relatively high proportion of clay, by burning at a low heat and grinding the product to powder. (3) *Portland cement* made from an artificial mixture of carbonate of lime (either chalk, ground limestone, or marl), with a certain proportion of clay, burning at a white heat and grinding the clinker to powder. (4) *Pozzuolana* or *slag cement* made by mixing finely-ground scoria (volcanic ash) or some kinds of blast-furnace slag with a small proportion of slaked lime. Of these the second and particularly the third are of chief importance in this country though the manufacture of slag cement is a promising industry.

The manufacture of hydraulic lime though carried on to a considerable extent in France, has never been established in this country probably owing to the abundance of excellent cement-rock in New York, Pennsylvania, and other

states. Hydraulic lime is light and bulky compared with the other cements. It requires from one to several days to set and hardens slowly, but some grades resist the continued action of sea water even better than Portland cement.

Natural-rock cement.— This material also known as common cement, hydraulic cement, Rosendale cement, and quick-setting cement, is manufactured in great quantities in some parts of the United States. It is made on a considerable scale in France, but the German and English output has been insignificant for some years. In the United States the material used is limestone or marl often containing over 23 per cent. of clay and the limestone is generally dolomitic, that is, contains carbonate of magnesium. In Europe magnesian limestones are seldom used. The cement rock is quarried, broken, and burnt in continuous kilns, much as limestone in the manufacture of ordinary lime. The burnt rock is a mass of partly vitrified clinker not affected by water. It is ground in mills of several types. Formerly all plants used millstones, and the light yellowish or brownish powder fine enough to pass a 50-mesh screen, is sent to market in barrels containing about 300 pounds, or in sacks. When mixed with water this cement sets in a few minutes and hardens gradually. It is cheap and when mixed with one part of sand by weight is used for mortar or concrete and for cistern and reservoir linings. It has not the great tensile strength of Portland cement, hardens slower and more imperfectly.

The composition of Rosendale cement rock and natural hydraulic cement is as follows:

Carbonate of lime	45.91
Carbonate of magnesia	26.14
Silica and insoluble	15.37
Sesquioxide of iron, Alumina	11.38
Water and undetermined	1.20
	100.00

Silica	22.75
Alumina and iron sesquioxide	16.70
Lime	37.60
Magnesia	16.65
Alkalies	.....
Carbonic acid	5.00
Sulphate of lime, Water	1.30
Total	100.00

The chief center of the industry in this country is the Rosendale district of Ulster County, New York, where the rock quarried is a limestone of the lower Helderberg series. It is also made in Pennsylvania, the Louisville region of Kentucky and Indiana, at several points in Illinois and around Milwaukee, Wis. The outputs in 1902 were: New York, 2,234,137 barrels; Indiana and Kentucky, 2,150,000; Pennsylvania, 942,384; Wisconsin, 481,020 barrels.

Portland cement.— This material was first made in England in 1824. The name is taken from the resemblance of the mortar to the oolitic limestone of Portland island in the English channel. The industry was later taken up in Germany. In both countries the industry grew enormously and the output now amounts to over 20,000 barrels yearly in Germany, and to nearly 9,000,000 barrels in England. Portland cement was first made in the United States at Coplay, Pa., in 1878, and since then works have been established in at least fourteen other states. The growth of the industry is perhaps the most marvellous thing in the whole history of the industrial development of this country. No farther back than 1894 the total annual product was small. Since then the output has increased enormously, over 100 per cent in a single year, and the annual product exceeds England's.

The composition of some Portland cement materials and Portland cements is shown by the following tables:

	Coplay, Pa., natural rock and limestone		Montezuma, N. Y., clay and marl		Santa Cruz, Cal., clay and coral rock		Phillipsburg, N.Y., natural rock only
	Cement rock	Limestone	Clay	Marl	Clay	Coralline	Cement rock

In 1891 but 13.2 per cent of the product used in this country was of domestic manufacture, in 1900, notwithstanding the great increase in consumption, due to the growth of the building industry from 1895 to 1900, the domestic manufacturer furnished 80 per cent of the material used. To-day the best grades of American Portland cement are as good as those produced anywhere, and in effectiveness of equipment, large output, and cheapness of production, the leading Portland cement plants of this country are models for the world. Not even in the development of our iron and steel industry have American energy, resourcefulness and mechanical, been more strikingly displayed. In making Portland cement, two processes are used, the wet and the dry. In the wet process marls and clays are used; in the dry process natural cement rock. The wet process plants are mostly in the marl section of Ohio, Indiana, and Michigan; the dry plants in the limestone

and shale regions of Indiana, Missouri, Virginia, eastern Pennsylvania, and western New Jersey. It is in the Lehigh section of Pennsylvania that the best features of American practice have developed. The stone is quarried by the use of air-drills and high explosives, at a cost of 18 to 50 cents per ton; the shale and limestone broken in large gyratory crushers, thoroughly dried in mechanical drier, finely ground in ball or tube mills or in mills of the centrifugal type and burnt to a clinker in cylindrical rotary kilns. The clinker is cooled in cooling towers and ground or stored for a few days and then ground to a fine powder in ball, tube, or centrifugal mills. For burning the clinker coal dust is generally used as fuel. The finely-ground clinker is packed in barrels holding 400 pounds each, or in sacks, for market. In the wet process the methods used differ only up to the burning of the clinker, and the differences are due to the nature of the materials, the clay and marl being ground together wet. But 15 per cent of the United States product is made in the wet way. The chief producing states in 1902 were: Pennsylvania, 8,000,000 barrels; Michigan, 2,400,000 barrels; New Jersey, 1,900,000 barrels; New York, 990,000 barrels; Illinois, 900,000 barrels.

The following table shows the production of natural hydraulic and Portland cement; the imports, exports, and domestic consumption, the figures being taken from 'The Mineral Industry:'

Year	Production				Imports	Exports	Consumption	
	Natural hydraulic	Portland and slag cement	Total barrels	Value	Value	Value		
1885..	4,000,000	150,000	4,150,000	$3,492,500	$840,191	$113,555	.....	.....
1890..	7,664,500	335,500	8,000,000	6,000,000	3,175,159	152,295	.....	.....
1895..	.....	750,000	.....	.....	.....	.....	.....	.....
1900..	9,177,222	11,309,052	20,486,274	15,393,109	3,330,445	289,186	23,481,933	18,434,368
1902..	9,083,759	17,082,175	26,165,934	22,023,248	2,581,883	575,268	28,402,466	24,429,863

Slag cement.— The ancient Romans used volcanic scoria or "pozzuolana" mixed with slaked lime to make a cement, the durability of which is attested by the solid masonry of many ruins. Within recent years it has been found that certain kinds of furnace slag, especially those from the manufacture of steel by the basic process, can give hydraulic properties to common lime. The mixture forms a slow-setting and slow-hardening cement that in time develops great strength. Though condemned by manufacturers of Portland cement, the product is gaining ground and the tonnage annually produced in Germany is considerable. In this the industry did not exist until 1895. Now there are large works making slag cement at Chicago, Ill., near Birmingham, Ala., at Jersey City, N. J., and elsewhere. A plant at Sharon, Pa., uses slag having the following composition: Silica, 32.72 per cent; alumina, 12.95 per cent; iron, 2.52 per cent; lime, 47.67 per cent; magnesia, 2.71 per cent; sulphur, 1.44 per cent. This slag as it comes from the furnace is granulated by contact with water and then dried. The lime is burnt, slaked, and mixed with the slag by mechanical mixers. The mixture is finely ground in tube mills. The resulting cement has this composition: Silica, 27.33 per cent; alumina, 11.61 per cent; iron, 2.43 per cent; lime, 55.83 per cent; magnesia, 1.93 per cent; sulphur, .87 per cent. The total production of slag cement in the United States in 1902 was 109,435 short tons, valued at $465,100. There are at least seven plants making it, two being in Alabama.

The use of cement, particularly in concrete construction, is increasing rapidly and bids fair to grow with the decrease of our forests.

Cenci, Beatrice, bā-ä-trē'chē chĕn'chē, Italian lady, the cause of the extermination of the noble family of Cenci. Muratori, in his 'Annals' (Vol. X., part 1, 136), relates the story as follows: Francesco Cenci, a noble and wealthy Roman, after his second marriage, behaved toward the children of his first marriage in the most shocking manner, procured the assassination of two of his sons, on their return from Spain, by banditti, seduced and debauched his youngest daughter Beatrice, a maiden of singular beauty. She discovered this shocking crime to her relatives, and even sought to obtain protection from Pope Clement VIII. It appears, however, that this was not granted: for, when the guilty father continued his former treatment with aggravated wickedness, she joined with her brother Giacomo, and hired two assassins, who put the monster to death as he slept. The guilty parties were discovered, confessed the murder on the rack, and were condemned by the Pope

to be torn to pieces by horses. In vain did the learned Farinaceus exert himself to obtain a mitigation of their punishment by a lively representation of the depravity of the deceased, 9 Sept. 1598. According to other accounts, Beatrice and her relatives appear to have had little or no share in the murder of the old Cenci; but a tissue of villany and baseness gained belief to the false testimony of two banditti against the Cenci family. So much is certain, that, 11 Sept. 1599, Beatrice Cenci and her stepmother were executed with a sort of guillotine called mannaia. Giacomo was killed with a club; the younger brother was pardoned on account of his youth; but the estates of the family, to which belonged the Villa Borghese, were confiscated, and in 1605 presented by the reigning Pope, Paul V., of the house of Borghese, to his family. In the Barberini Palace at Rome, travelers are shown an excellent painting, said to be by Guido Reni, as the portrait of the unfortunate parricide; but this is now controverted, and recent investigations tend to show that the popular version of the whole story is far from the true one. Shelley has made the Cenci the subject of a drama. See Bertolotti, 'Francesco Cenci e la sua Famiglia' (1877).

Ceneda, chā-nā'dä. See VITTORIO.

Cenis, sĕ-nē', **Mont,** a mountain belonging to the Graian Alps, between Savoy and Piedmont, 11,755 feet high. It is famous for the winding road constructed by Napoleon I., which leads over it from France to Italy, and for an immense railway tunnel, which required nearly 14 years' labor. It superseded a grip railway which was constructed over the mountain by Mr. Fell, an English engineer in 1864–8. The tunnel does not actually pass through the mountain, but through the Col de Fréjus, about 15 miles to the southwest. The Mount Cenis Pass is 6,765 feet above the level of the sea, whereas the elevation of the entrance to the tunnel on the side of Savoy is only 3,801 feet, and that on the side of Piedmont 4,246 feet. The total length of the tunnel is 42,145 feet, or nearly 8 miles. For the sake of the drainage the bottom of the tunnel has a culminating point about the middle, and falls southward 128 feet, and northward 473 feet. The breadth of the tunnel at the base is about 25 feet, at the widest part about 26 feet; its height at the Modane end is 24 feet 7 inches; at the other end about a foot higher. The determination of the exact direction and height of the tunnel occupied a full year, and the work of piercing the tunnel was carried out with so much precision that the borers who had begun simultaneously from both ends met exactly. The tunnel is laid out for two lines of railway. The roof and walls are lined with masonry to the thickness of two feet seven inches, and where the ground is not very firm it is underarched. The boring was at first carried on by hand labor, and one eighth of the total length of the tunnel was finished in this way, but the rest was constructed by machines specially devised for the purpose. Each boring machine had 18 borers, by which holes about three feet in depth were wrought in the rock. For the blasting of every yard of the tunnel 97 borings on an average had to be made, and above 100 pounds of gunpowder were employed. The total cost of the tunnel amounted to $12,636,000, which was borne partly by the French and Italian governments and partly by the Northern Railway Company of Italy. The first mine of the tunnel on the Italian side was exploded by Victor Emmanuel at the end of August 1857; on Christmas Day, 1870, the workmen met in the middle of the tunnel; and on 17 Sept. 1871, the tunnel was officially opened.

Cen'obites (Gr. *κοινος*, common, *βιος* life), monks living in community with others, under a common rule instead of seeking the strict solitude of anchorites. The ascetics of the first ages, who dwelt in the deserts together, were usually called by this name, the place in which they lived being called a *cœnobium*. Some writers refer the institution of these communities to the times of the apostles, others to St. Anthony (q.v.).

Ce"nogen'esis. While many animals during postembryonic growth pass through a series of stages which are similar to the ancestral forms of such types (palingenesis), in certain species development is direct. The different stages of growth or metamorphosis are crowded back to the embryo stage, or abbreviated, and the animals hatch or are born in the shape of their parents. This is called cenogenesis. Thus certain frogs, as a tree-toad of Guadeloupe, W. I., where there are no marshes, do not pass through a tadpole stage, but hatch without tails, and with legs, and otherwise resemble their parents. The same is the case with certain shrimps and crabs, and is partly the case with the lobster. In all such instances the direct development is apparently due to a difference in the environment, or other conditions of life, especially in certain crustacea, to a change from salt to fresh water.

Cenotaph, sĕn'ō-tăf, a monument erected in honor of a deceased person, but not containing his body, as is implied from the derivation (Gr. *κενός* empty, and *τάφος* a tomb). They were often erected by the ancients, who believed that when the body was not buried the soul could not be admitted into the abodes of the blessed.

Cenozoic (sē-nō-zō'ik) **Era,** the last of the five great divisions commonly used in classifying geological time, and therefore including the present. As it is the last, its records are much more complete than those of the Mesozoic, but while more complete they are, perhaps, more perplexing. Of the older eras — as, for instance, the Palæozoic — much of the record left in the rocks has been obliterated, and thus only the traces of the greater changes in the distribution of land or water and of variations of climate have come down to us. Thus, while much is lost, the broader grouping of facts is easier. In the Cenozoic we have such a wealth of detail, such a great mass of evidence to sift and correlate, that geologists differ greatly as to how the record of the rocks shall be translated.

Generally speaking, the rocks of the Cenozoic Era are less compacted than those of the Mesozoic, being very often beds of loose sand or clay. They usually lie horizontal, though sometimes upturned in a great mountain range. Any particular series is seldom of wide extent, and different series tell widely different stories of climatic conditions. Thus, probably no series in the Cenozoic in North America is comparable with the coal-bearing formations of the Cretaceous.

As to the climate of the Cenozoic, it was at first remarkably mild and even, Spitzbergen and Greenland having as mild a climate as that of Ohio to-day. Gradually the climate became colder, resulting in the great continental glacier of the Ice Age. At a comparatively very recent date these glaciers receded, and the climate of the earth became substantially what it is to-day.

Cenozoic life is, on the whole, well differentiated from Mesozoic, particularly by the great development of mammals and, probably well along in its last half (reckoning by actual time), by the advent of man. As mammals have developed, so reptiles have declined, and to-day only snakes, crocodiles, lizards, and turtles represent the class; the great ichthyosaurs, plesiorsaurs, dinosaurs, and pterosaurs were passing away by the end of the Cretaceous. In fact, as the Mesozoic was the era of reptiles, so is the Cenozoic the era of mammals. Among invertebrates many curious Mesozoic types have disappeared, but of the genera in existence early in the Cenozoic most still exist. This also is true of Cenozoic plant life.

As has been noted, geologists differ in their divisions and subdivisions of Cenozoic time. American geologists generally make two great divisions, Tertiary and Quaternary.

Consult: Dana, 'Manual of Geology'; Geikie, 'Text-book of Geology'; Le Conte, 'Elements of Geology.' See also GEOLOGY; GLACIAL PERIOD; QUATERNARY; TERTIARY.

Cen'ser, a vessel in which incense is burned. Censers were employed by the Jewish priests for presenting incense to the Lord in the sanctuary. Josephus tells us that King Solomon made 20,000 gold censers for the temple of Jerusalem to offer perfumes in, and 50,000 others to carry fire in. Censers or thuribles are used in some modern churches, especially in the Roman Catholic Church at mass, vespers, and on other occasions. They are suspended by chains, by which they are swung about in the hand to spread the incense in all directions.

Cen'sors ("assessors"). In ancient Rome, originally two officers who rated the property of citizens in order to assess their taxes, on which all political rights were based; the community being graded by amount of income from estates. Being thus arbiters of the political and social position of every freeman, they speedily became the most important officials in the state except the occasional dictators. The supreme judicial functions, and the control of morals, fashion, and speech, which we associate with "censorship," flowed naturally from this. The essence of their duty being to fix the status of each citizen, they took cognizance of everything which bore upon it; and became arbiters of the sumptuary laws and customary observances which are the cement of early communities. Not only could they expel a senator from the senate and take his horse from a knight or even reduce him to the ranks for lack of property qualification, or notorious evil living, but they could punish for slack tillage, celibacy, demeaning occupations, extravagance, or any other conduct thought prejudicial to the common weal. There was an appeal to the popular assembly, however, and they had to state their charges publicly. The censors also filled vacancies in the senate, and appointed its chief, originally at will, later according to a prescribed list. They let out the taxes to farm, took charge of public buildings, roads, aqueducts, etc. The term, legendarily five years at the outset, was a year and a half in historical times; originally patricians alone were eligible, but by fully historical times the plebeians had gained one censorship and occasionally secured both. The emperors assumed censorial power under the title "prefects of morals." The last who bore it was the brother of Constantine the Great.

In American history, the title was given to two sets of state officers in imitation of the Roman office. The 1776 Constitution of Pennsylvania provided that the people should elect a council of censors once in seven years, two for each city and county, to investigate the acts of the governmental departments, inquire whether or not the Constitution had been violated, etc. This curious article was dropped in the revised Constitution of 1790. But in Vermont a similar article had a far longer life, surviving until a comparatively recent time. That State in 1777 proclaimed its independence, and drew up a Constitution. One article, following the example of Pennsylvania, provided that on the last Wednesday of March in 1785, and the same day every seventh year thereafter, the people should choose a council of 13 censors, who should examine whether the Constitution had been preserved inviolate; whether the legislature had performed its duty as a guardian of the people, or had exceeded its powers; whether the taxes had been justly laid and collected, and how the public moneys had been expended; and whether the laws had been duly executed. They were also empowered, if they thought a change in the Constitution was needed, to call a convention to meet within two years thereafter, giving notice of the proposed change at least six months before the meeting. The last one so called, in 1870, abolished its creator; but the censorship seems to have worked fairly well for nearly a century.

Censorship of the Press, a regulation subjecting books, pamphlets, and newspapers to the examination of certain civil or ecclesiastical officers, who are empowered to authorize or forbid their publication. Such a regulation was suggested by Plato, and an informal censorship existed in the times of Greece and Rome. After the Roman Catholic Church acquired a share in the civil power it induced the state to condemn heretical books. Throughout the Middle Ages it sanctioned the principle that books objected to by its authorities should be suppressed. The invention of printing and the increasing number of books called forth new and stricter prescriptions of censorship, and there still remain copies of books printed in 1479 and 1480 which are accompanied with solemn approbations and attestations in their favor. Finally, in 1515, the Council of the Lateran, assembled at Rome, decreed that in future no books should be printed in any town or diocese unless they were previously inspected and carefully examined by the bishop of the diocese or his deputy, or by the inquisitor of the diocese or his deputy, or if at Rome by the Pope's vicar and the master of the sacred palace. Every work which was approved was to be countersigned by the hand of the censor, and any publication not thus coun-

tersigned was to be burned and its author or editor excommunicated. See INDEX.

In countries where the Reformation prevailed, the censorship was not abolished. Licensers of books were appointed in England, who were for the most part bishops. A general system of censorship was established by a decree of the Star Chamber, dated 11 July 1637, which was later confirmed by an act of Parliament. It was against this act that Milton wrote his great plea for freedom of the press, the 'Areopagitica,' but the censorship was not abolished until 1693.

Censorship of the press existed under the old French monarchy. It was abolished at the Revolution, but revived under Napoleon I. and again under Napoleon III. Except in Russia and Germany, where it is still in force, systematic censorship of the press may be said scarcely longer to be maintained in European Christian countries. In the United States there has never been such a censorship, although there are laws against publications of a scandalous character; there are various State laws against libel and a government censorship in the Philippines.

Censure, in canon law, a spiritual penalty whereby a contumacious offender is denied the use of certain spiritual goods. It has three degrees, excommunication, suspension, and interdict. By excommunication the offender is cut off from association with the faithful whether in spiritual things or in secular; by suspension a minister of the Church, a cleric, is deprived of the right to exercise the functions of his station; by interdict the services and ministrations of the Church are denied to an offender — the sacraments and the right to Christian burial. An interdict may affect places as well as persons; it may be laid on a church edifice or a burial place. Censures are the penalties prescribed in the Church's law for definite offenses, and some censures fall upon the offender, *ipso facto* or *ex ipso jure,* without need of a judgment being pronounced by Church authorities. Such a censure is said to be *latæ sententiæ,* that is, providing for its own carrying out; but most censures are *ferendæ sententiæ,* requiring that the sentence be pronounced by some proper authority, as the bishop of a diocese or his deputy. And absolution from some censures *latæ sententiæ* is reserved to the supreme pontiff, while absolution of other censures can be given by bishops, or other pastors, either in the ordinary course of their jurisdiction or in virtue of special faculties accorded to them to that end. An example of a censure, release from which is reserved strictly to the supreme pontiff himself, is the censure of excommunication incurred by whoever violently assaults a cleric or a member of a religious order (*clericus vel monachus*); but an exception is made of the case where the offender is in danger of death.

Cen'sure, Congressional, of the President of the United States, a makeshift in lieu of an unattainable impeachment. There have been two cases of this, one by the Senate and one by the House. (1) During the long debate in the winter of 1833–4 over Jackson's cessation of deposits in the United States Bank, resolutions of censure were moved in the Senate; and after three months' wrangling over them and their form, it resolved 28 March 1834, 26 to 20, that the President had arrogated authority "not conferred by the Constitution and laws, but in derogation of both." Jackson, by a special message 15 April, protested that this was a virtual impeachment of him as violating his oath of office, without giving him a chance to defend himself. The Senate majority (John Tyler being one) refused to receive or record the protest. Thomas H. Benton thereupon gave notice that he should move yearly to have the resolution expunged. It was objected that this contravened the Constitutional requirement to keep a journal, but Benton argued that the resolution was no part of legitimate legislative proceedings. On 16 Jan. 1837, the Jacksonians carried the curious compromise of having the resolution surrounded with black lines on the journal, and marked "Expunged by order of the Senate"; which of course left it intact, and merely recorded a change of feeling as to its justice. (2) To catch the Southern vote, the Democrat Tyler had been put on the ticket of the Whig Harrison in 1840; and on Harrison's death within a month of inauguration succeeded him as President. The Congress was Whig; and at its first session 1841–2, passed a tariff bill to distribute the surplus revenue among the States. Tyler vetoed it on the ground that the country had no business to raise taxes in excess of its needs, and that it was simply legalizing unjust burdens on the people. The Whigs had not a two-thirds majority to pass the bill over his veto, could not carry an impeachment, and in the House referred the veto message to a committee, which in its majority report censured Tyler for improper use of the veto. Tyler protested, and in reply the House sent him a copy of the Senate resolution he had voted for in Jackson's case.

Census. The utility to a government of knowing the extent of its resources in men and property is so obvious that some means of ascertaining it were probably employed early in history; but there is no record of it on the Egyptian or Assyrian inscriptions, and the Chinese accounts are dubious. The first we have reliable mention of is that of the Jews by David, including the males of 20 and over and the cattle; and the hatred and suspicion aroused by it are witnessed by the belief that God punished the whole people for the impiety. This apparently irrational feeling was universal in early times, has always been so in the East, and is by no means unknown elsewhere and later; its prevalence in 18th-century America, and even later in England, however, is probably due to misunderstood Bible teaching. The real reason was, that the early censuses had for an object not statistics, but taxation and conscription; and it was not to the advantage either of officials or people that the government should have too minute a knowledge of what could be extorted from them. Poverty and sparseness of population were too convenient excuses for not paying taxes or not remitting them to the capital. In the West, however, when constitutional government replaced autocracy, the census became a necessity for apportioning political rights and contributions; as in the Solonian constitution of Attica, where society was divided into four classes, with privileges graded according to income from landed estates. In Rome, whence the name "census" ("assessment") comes, it

was much the same; and as the enumerations were valued merely for the ratings deduced from them, not from any idea that statistics by themselves were of any value, they were discarded as soon as their use had passed, to the irremediable impoverishment of history. These censuses were taken at long and irregular periods, sometimes nearly half a century elapsing. But as the empire grew and the provinces were farmed by proconsuls, these found the same need of a thorough detail of their temporary estates, to know whether their sub-farmers were cheating them, that a capitalist does of his business; and each took a census (*professio*) of his own province on his own account, whose inquiries were sometimes almost as minute and exhaustive as those of the latest United States special census report on agriculture.

The mediæval censuses were of the roughest and far apart, and made only by a few enlightened rulers. Charlemagne attempted one for his dominion; and the Domesday Book of William the Conqueror in 1181 is familiar. This was a register of estates, with the heads responsible for feudal duties, their slaves and cattle — a census of the primitive type for the primitive objects.

The modern census, as a statistical review for its own sake, has a treble origin, in Sweden, England, and the United States. In 1686 the Swedish parish clergy were required to keep a record of births, marriages, and deaths, accessions and removals of inhabitants, unusual happenings, etc. Of course registration, which is a record of changes, is not a census, which is a statement of condition at a certain time; but with a given basis it can be turned into one. By request of the Swedish Academy of Sciences, in 1746, the clergy were directed to compile statistics of population, etc., for a quarter-century past; but these were kept rigidly confidential till 1762. At their publication Dr. Richard Price, the founder of scientific life-insurance calculation, based his first insurance tables on them. At first annual, then triennial, since 1775 they have been published once in five years. Meantime, in England, the London bills of mortality, first begun after the plague of 1592, had been recorded weekly since 1603, the year of James I.'s accession; and in the last half of the 17th century Sir Wm. Petty, the noted political economist, used them as a basis for very valuable and stimulating works on the extent and growth of population, human fecundity, effects of social and political causes, etc. Others took up the subject and made computations. In 1791 Sir John Sinclair undertook the most herculean statistical task ever attempted, perhaps, by a single man — to compile a census of the population, agriculture, trade, and industry of the entire kingdom, by inquiries sent to the clergy of the Established Church. He sent out schedules of 160 interrogatories, received over 900 replies, and in 1798 published 21 volumes of results. His work, and his exhortations made weighty by his work, induced Parliament in 1800 to establish a census office; the first census was taken the next spring, and decennial censuses have been maintained ever since. That of 1851, like the American of 1850, was a long step in advance. The Russian censuses had begun earlier, but on the most ancient model, purely for military purposes, and therefore with no count of females. There were a few partial censuses from 1700 on. In 1718 Peter the Great ordered all landed proprietors to give in an account of their slaves; and the same year organized a body of canvassers to visit all the provinces and make returns to him of peasants, mechanics, domestics, and people without occupation. In 1722 a ukase ordered a census taken every 20 years thereafter, and it was observed till 1782, another taking place in 1796. In 1802 a central bureau was organized, and a census taken; and they have been taken in 1812, 1815, and 1834, decennially 1850–80, then in 1886 and 1897. France began taking them after the Revolution, Prussia in 1805; Austria, which had made rough counts for military conscription, organized a bureau in 1828; Belgium established one immediately after winning her independence in 1833, and it has been perfected by the genius of Quetelet and other eminent statisticians, and furnished most valuable contributions to science. Our own census was entirely independent of all these in origin.

The United States Census.— For the various guesses at colonial population, and the methods of arriving at them, see UNITED STATES (*Population*). It may be mentioned here, as germane to this subject, that when Gov. Hunter of New York in 1712 attempted to take a census, the biblical prejudice before mentioned compelled him to leave it unfinished; and that when the New Jersey government a few years later wished to do so, it did not dare begin. An accurate determination, however, became vital early in the independent life of the country. To apportion equally the burdens of the Revolutionary war, the Congress of the Confederation agreed to defray the charges out of a common treasury, to be supplied by the States in proportion to the value of all the land in each; and to requisition the quotas of land forces according to the quotas of white inhabitants. Under the Constitution of 1787 the question of number became exigent, as direct taxes and representatives in Congress were apportioned according to the number of free inhabitants in each State (including bound servants and excluding Indians not taxed) and three fifths of all others. Censuses, therefore, became part of the ordinary running machinery of the government; and the first one was taken in 1790. Nine months were allowed for the work, but the time was extended the next year, as regularly for many a decade thereafter. The scope of inquiries simply included families: the name of the head alone being set down, with the number of others included, and slaves as a property item, the sex and color of free persons, the number of free white males of 16 and upward, number of free white females, and of all other free persons. The enumeration was committed to the marshals of the judicial districts of the United States (16 in all), who were to employ assistants as needed. No form of schedule was provided, each enumerator using any sheets or blank book he chose. This continued till 1830. There was no central bureau to receive or supervise returns, which were put together by the marshals and transmitted to the President. A penalty of $200 was imposed for false returns or delay beyond a certain time; and the same on individuals for giving false information or refusing any. The returns in the North were given by counties, cities, and towns; in the South by counties only. Two copies of the enumeration of each

district were to be posted in some public place therein. The cost of this census was $44,377.28. The result, as usual, pricked many local bubbles; and as the country was not used to this, there was not only general disappointment but distrust of the census, and United States officials carefully explained to foreigners that the returns were very defective. This is not now believed.

The second census, that of 1800, was specifically intrusted to the Department of State. There was no change in methods, except that the secretary was to instruct the marshals as to schedules and interrogatories. The only changes in scope were to classify the ages of free white males rather more minutely, extend the classification to females, and insert the name of county, city, or town where the family resided. Memorials by Thomas Jefferson and Timothy Dwight, under the names of learned societies, wisely suggesting that Congress utilize the occasion by having the census include statistics of mortality, nativity, and industries, were ignored; but took root in later censuses. There were 19 districts, and the cost was $66,109.04.

The third census, that of 1810, improved somewhat on the loose methods of the two former. The enumerators now had to be residents of their districts, which could not be more than one county or city, but might be several contiguous towns, and must be plainly marked off by natural or political boundaries; and they must make personal inquiries at each dwelling-house or of the head of each family in their district. In Territories the secretary, or if there was none, the governor, replaced the marshal. Attested copies of the returns must be filed with the secretary of state. An attempt at a manufacturing census was made, and the secretary of the treasury was empowered to give instructions for it. But the time was too short; the inquiries were too many and injudiciously framed; the manufactories in a district were generally so few that the returns would disclose their private business, and there was no penalty for refusal to answer; and the returns were scattering and valueless for volume, though they had some value as indicating variety and distribution of industries. There were 26 districts and Territories, and the cost was $178,444.

The fourth census, that of 1820, for the first time introduced the valuable feature (suggested by Jefferson and Dwight) of distinguishing between natives and foreigners, naturalized or otherwise. It also discriminated the free colored and the slaves by sex and age, and the free whites between 16 and 18. It reduced the manufacturing interrogatories to 14, of much the same scope as now. and a digest was ordered made and printed. This department was a failure as before, however. There were 31 districts, and the total cost was $208,525.99.

The time of taking the fifth census, that of 1830, was changed on John Quincy Adams' suggestion to 1 June, as it has ever since remained. A very significant provision in the act was to prevent the marshals from blackmailing their subordinates, by exacting either bribes in advance or part of their pay later. Printed schedules were sent out, of uniform size, 18 x 15. The industrial statistics were dropped altogether. But inclusion was made of the deaf and dumb — white, free colored, and slave — classified by age but not by sex, and of the blind, not classified at all. Ages were also very minutely classified. There were 36 districts and Territories, and the cost was $378,545.13.

The sixth census, that of 1840, was in one respect the beginning of a new era; in most others, the close of an old one. It first attempted health statistics — those of the insane and idiotic, at public and private charge; educational — scholars in colleges, academies, and public schools, illiterates over 20, etc.; besides Revolutionary pensioners, an item wholly aside. Industrial statistics were also restored, and much matter collected. In a word, it was the first systematic and connected attempt to make the census a general body of usable statistics in the larger sense, a comparative survey of the life and changes of the country. But the effort is all that can be praised; its execution was a national scandal. The errors were so teeming and so monstrous that various bodies sent protests to Congress against its publication, and urged that it be either corrected, or if that were not possible, entirely disowned. This result was due partly to inadequate pay and ignorant enumerators, but partly also to the dislike in many sections to the new questions as "inquisitorial" and offensive. The old dislike to governmental "prying" was strong enough to warrant a prominent paper in becoming its spokesman, insinuating that the census was a "precursor to direct taxes," and that it was unworthy of "the dignity and the high functions of the Federal government to pursue such petty investigations." There were 39 districts, and the cost of the census was $833,370.95. It was published in three volumes.

All these six censuses had a common defect which robbed them of ultimate statistical value: they lacked uniformity in method, and to a large extent could not furnish comparisons or accurate deductions. The enumeration extended over long periods, many months at a time; the results were not summarized by counties, nor uniformly by cities or towns; the classification of ages of colored people was on a different basis from that of whites, etc.

The seventh census, that of 1850, begins a new era. The blunders of the last one, and the public disgust and indignation, had aroused great discussion as to proper methods; and on 3 March 1849, the same act which created the Department of the Interior also created a census board, consisting of the secretary of state, the attorney-general, and the postmaster-general, to prepare a census schedule including not above 100 inquiries. They framed plans which were adopted by Congress 23 May 1850. These schedules comprised: (1) Free inhabitants. (2) Slaves. (3) Mortality. (4) Products of agriculture. (5) Manufactures. (6) Social statistics. But the great advance which it made was in scheduling individuals instead of families, thereby making full statistical comparison for the first time possible. The name, age, sex, color, and place of birth of each person, free or slave, were now set down. Improvements in method were also made. The enumerators' districts were to be not exceeding 20,000, if feasible, on the basis of the last census; the returns were not to be compiled by the marshals, but at a central office in Washington created within the Department of the Interior. Its head or "supervising clerk," commonly called "superintendent

of the census," was Joseph C. G. Kennedy of Pennsylvania; the latter part of the compilation was done under the charge of James D. B. De Bow of Louisiana. There were 45 districts, and the work cost $1,423,350.75.

The eighth census, that of 1860, was on much the same lines as the previous one. Mr. Kennedy was superintendent. Fortunately, the enumeration was finished before the War broke out. The principal change in schedules was to classify females as well as males by occupation. In the compilation, slaveholders and slaves were classified by States and Territories for 1850 and 1860. There were 64 marshals and secretaries. Cost, $1,969,376.99.

The ninth census, that of 1870, was taken under changed conditions, some of which interfered with its completeness and accuracy. The mass of enfranchised negroes in the South could no longer be counted on plantations by one authority, and were too ignorant to answer questions for themselves; and the Reconstruction conditions greatly impeded work. A new system had been carefully drawn up by Garfield, after consultation with Francis A. Walker, Edward Jarvis, and other eminent statisticians, which would have made partial amends; but it was killed in the Senate. It formed, however, the basis of the next census. Gen. Walker, then chief of the bureau of statistics in the Treasury Department, was made superintendent, and his ability did much to redeem the defective system. The heading "slaves" had of course to be dropped, and the number of male citizens of the United States to be substituted. To satisfy the 15th Amendment, a schedule was introduced of the number of such citizens whose right to vote was denied or abridged except for crime, etc.; but it was valueless. The month of births and marriages within the year was added. In "colored," Chinese and Indians were discriminated from negroes. In "illiterates," those unable to read were distinguished from those unable to write. In nativities, the place of parents' birth was added, for the first time giving the number of native citizens of foreign parentage. A statement of public debts, State, municipal, etc., was included. Many changes were also made for clearness, or to remove objectionable inquiries. The enumerators were put under civil-service reform rules.

A strong effort was made to have an interdecennial census taken in 1875, but it was not successful, though Grant recommended it in two annual messages. But for that of 1880, the system desired for 1870 was passed, under Garfield's presidency, completely revolutionizing the census methods. The changes may be summarized as follows: (1) The superintendent of the census and his chief enumerators, instead of being mere clerks of the secretary of the interior, became officials directly appointed by the President and confirmed by the Senate. (2) The marshals — court officers appointed for duties unconnected with census work and often conflicting with it — were replaced by supervisors of the census, not to exceed 150 in all, and each State or Territory to have at least one. The entire number were appointed, and New York State had 11. Their assistant enumerators were subject to veto by the census office. (3) The enumerators' districts were reduced to an estimated maximum of 4,000 instead of 20,000, these subdivisions being also subject to the disallowance of the census office. This increased the number of enumerators from about 6,400 in 1870 to 31,265 in 1880; and enabled not only a swifter completion of work, but much closer local and personal knowledge on the part of enumerators, as each must be a resident of his district. (4) The time of enumeration was reduced to one month, or two weeks in cities of over 10,000 inhabitants by the previous census; making results more nearly simultaneous. (5) Compensation was more closely adjusted to work. (6) Industrial statistics for 279 cities and large towns, and for the country at large in certain selected industries, were withdrawn from the regular enumerators and given to certain special agents, who need not be residents. The enormous advantage of this scarcely needs exposition. Not only did it allow the employment of abler experts, but manufacturers will often give information to distant strangers, to be filed far off, which they would not put in the hands of local residents. In this census also a large use was made of "prior schedules," left with parties before the enumerator called; they had been introduced in 1870, but little employed. This census was by far the best, speediest, and most helpful of all to that date, and marked another era. The scope was also extended. For the first time the statistics of defectives, crime, and pauperism were thoroughly and properly classified; those of the factory system, of churches, museums, taxation, insurance, etc., entirely new, with better ones of schools and colleges, collected independently, were of great utility; and many improvements were made in other schedules. Gen. Walker was the head of this census also, and the author of most of its advances. Its cost was $5,790,678.40.

The 11th census, that of 1890, was in general taken by the same methods as the 10th. Ten chiefs of division were appointed, 175 supervisors, and 47,975 enumerators. The superintendent was Robert P. Porter. The most important additions were: (1) All surviving soldiers, sailors, and mariners of the Civil War, and their widows. (2) Classification of colored persons according to amount of white blood, from full-blooded negroes up to octoroons. (3) Indebtedness of private corporations and individuals. (4) All Indians in tribes, with Indian and English names of each, age, occupation, and whether paying taxes or not. (5) Census of Alaska. (6) Unincorporated express companies. An attempt was made to collect statistics of chronic disease; but the inquiries were too delicate to intrust to local residents or expect people to communicate to such, and the statistics gathered were of no value, besides exciting much public ill-will. Special agents were employed for 1,042 manufacturing centres, in place of the 279 in 1880. Special attention was paid to nativity, to fecundity of native and foreign-born mothers, the expectation of life of children of native and foreign-born parents, naturalization, and ability to read and speak English. Prior schedules were extensively used. Electric tabulation was employed, not alone greatly increasing both speed and accuracy, but enabling various statistical compilations to be made which were otherwise impracticable. It filled 25 volumes, and cost $11,547,127.13.

For the 12th census, that of 1900, preparations had been mooted before the 10th was well under way; and the question of a permanent census bureau, strongly urged over half a century since by the able statistician De Bow, was brought up, and its merits set forth in a valuable and exhaustive report by Supt. Porter. After much debate, an act of 3 March 1899 established such an office in the Department of the Interior. By this act the superintendent of the census is entitled the director of the census. The President, who appoints him, must also appoint an assistant director, who must be an expert statistician; and the director is to appoint five known and tried statisticians as chiefs of divisions, a geographer, a chief clerk, and a disbursing clerk. The first director under this bill was William R. Merriam; assistant director, Frederick H. Wines; chiefs of divisions, William C. Hunt, population; Willam A. King, vital statistics; S. N. D. North, manufactures; Le Grand Powers, agriculture; Walter F. Wilcox, methods and results; geographer, Henry Gannett. The law creating this bureau, however, greatly limited its scope. The collection of "side" statistics was thought to retard the preparation and publication of those assumed to be alone of general interest, and the inquiries were restricted to the four heads of population, mortality, agriculture, and manufactures. The work was to be finished within two years; and at this writing (May 1903) three of the heads have been published, two volumes for population, two for agriculture, and four for manufactures. This limitation would not be regrettable — the census organization not being the ideal one for many classes of statistical inquiries — but that Congress is not likely to appoint other boards or commissions to do the work thus dropped, as is done in foreign countries. There the census relates only to population, and other inquiries are made through other sources, or by copying registration returns. Congress, however, is doubtful of its power to compel answers except through the census acts.

State Censuses.— A number of States have Constitutional requirements that a State census shall be taken once in 5 or in 10 years, or between two national censuses; but only a few pay any attention to the matter or attain results of any value. Massachusetts, Rhode Island, New York, and Michigan thus far are the only States which have done good work in this line. The Massachusetts censuses from 1855 on, and the Michigan of 1874 and 1884, are notably good. On 3 March 1879, an act of Congress provided that any State which will take an interdecennial census in all respects equal to that of the United States, and file a copy with the secretary of the interior, shall receive from the national government 50 per cent of the amount paid to supervisors and enumerators, plus 50 per cent of the gain per cent in population between the two last preceding national censuses. Even this lure, however, has not thus far increased the interest of the States in their statistics.

WILLIAM R. MERRIAM,
Supt. Twelfth Census.

Cent, a United States coin and money of account, the 1-100 of a dollar. The convenience of decimal computation has caused in various countries the division of the monetary unit into hundredths, with names derived from Latin *centum* or its adjectives; as the French franc into centimes, the Dutch guilder into cents, the Italian lira into centesimos, the Spanish-American dollar into centavos, etc. Jefferson regularly used "cent" to mean the hundredth of any unit of mensuration; but in its first suggestion for our coinage it meant 100. The inconvenience of the English system being felt, Congress in 1781 instructed Robert Morris to devise a system of national coinage; and he proposed a unit of ¼ grain silver (or 1-1440 of a Spanish dollar, familiar in the colonies), of which 100 were to make a cent (about 7c. of ours), 500 a quint (34.7c.), and 10,000 a mark ($6.94). Jefferson proposed instead the dollar as the unit, the smallest coin to be of copper and 1-200 of it (that is, the old English farthing, our half cent); this was adopted 6 July 1785. But on 8 Aug. 1786, an act was passed, still modeled by Jefferson, to coin a cent, of which 100 were to weigh 2¼ pounds avoirdupois (157.5 grains each), and be equal to a dollar, and a half-cent proportionate. This was the first use of the name in our coinage, and doubtless represents Jefferson's "hundredth." The "cents" prior to this have not that name on them, and are really English half-pence. The difficulty of displacing a popular name is shown by that of "penny," which still clings tenaciously though absurdly to our cent, only half its value. Congress in 1787 established a mint in New Haven, and for years coined there the "Fugio" or "Franklin" cents, familiar to collectors. But from 1785 to 1788 several States coined copper "cents" on their own account. Vermont (not yet admitted) began in June 1785; Connecticut in October 1785; Massachusetts late in 1786 (real cents and half-cents); New York, 1786; New Jersey, 1786 (coppers 15 to the shilling). Under the Constitution the first coinage act was passed 2 April 1792, and raised the weight of the cent to 264 grains; but on 14 Jan. 1793, it was reduced to 208, and on 26 Jan. 1796, to 168, the half-cent always being proportional. The first coinage under the new act was in 1793. This old-fashioned "copper" remained unchanged except in pattern till 1857, and its forms from 1793 to 1857 are of seven types: (1) (1793), chain or link around the word "cent"; (2) 1793, wreath in place of chain; (3) 1793–6, liberty cap on pike over left shoulder of "Liberty"; (4) 1796–1807, "Liberty" with draped bust; (5) 1808–14, filleted head with 13 stars; (6) 1816–39, plain coronet with coiled hair; (7) 1839–57, same with braided hair. No cents were coined in 1815 or 1835. Those of 1799, 1793, and 1804, are very rare, as are also the *copper cent* of 1856, and the half-cents of 1793, 1831, 1840 to 1848, and 1852. On 3 March 1851, a 3-cent piece was authorized, of 12⅜ grains, 75 per cent silver, 25 copper, legal tender to 30 cents; on 3 March 1853, it was raised to .900 fine, but reduced to 11.52 grains, 3/50 of the half-dollar. On 21 Feb. 1857, the half-cent was abolished, and the old cent replaced by a smaller new one, of 72 grains, .88 copper and .12 nickel. On 22 April 1864, this was supplanted by a bronze cent, 48 grains (the present one), .95 copper and .05 tin and zinc, legal tender to 10 cents; and a bronze 2-cent piece, twice its weight and legal tender. On 3 March 1865, a 3-cent piece was authorized, ¾ copper and ¼ nickel, 30 grains, legal tender

to 60 cents; but the ones and twos were made legal tender to only four cents. On 16 May 1866, a 5-cent piece (the "nickel") was authorized, same material as the 3, 77.16 grains, legal tender to $1. On 12 Feb. 1873, all cents and their multiples were discarded except the 1, 3, and 5, as above, each to be legal tender to 25 cents; and on 26 Sept. 1890, the 3-cent piece was discarded. See NUMISMATICS.

Cent, a name given under the old Germanic constitution to a small portion of territory. Each province or district was subdivided into so many cents, and was placed under the special jurisdiction of an overseer or centenarius. The name corresponds with hundred as in English territorial division.

Cent-Gardes, säṅ-gärd, **Les** (Fr., "The Hundred Guardsmen"), a body-guard acting in the service of the French king during several centuries. See GUARDS.

Cent Jours, säṅ zhoor, **Les** (Fr., "The Hundred Days"), the second period of the reign of Napoleon I., so called because it lasted precisely 100 days, from 20 March 1815, when he re-entered Paris on his return from Elba, to 28 June of the same year, when the second restoration was established.

Cent Nouvelles Nouvelles, säṅ noo-vĕl noo-vĕl, a collection of facetious tales, first published at Paris in 1486. They were told at the table of the dauphin, afterward Louis XI., in the castle of Genappe during his exile. Their arrangement in their present form has been attributed to the Count of Croï, to Louis himself, and to Antoine de La Salle. The latter, however, seems to have been the editor. The work is a curious example of a kind of literature distinctively French, and which, since its revival by Voltaire in the last century, has always been successfully cultivated: the literature that considers elegant mockery and perfection of form adequate compensation for lack of morality and lofty ideals. The historical importance of the collection arises from its giving details regarding the manners and customs of the 15th century that can be found nowhere else. Its very licentiousness is commentary enough on the private life of the men and women of the time. In spite of its title, however, there is nothing novel in the incidents upon which the 'Nouvelles' are based. Their novelty consists in their high-bred brightness and vivacity, their delicately shaded and refined but cruel sarcasm. With a slight modernization of the language they might have been told at one of the regent's suppers, and they are far superior to those related in the Heptameron of the Queen of Navarre. The 'Nouvelles' also show us that the Middle Ages are past. Instead of gallant knights performing impossible feats to win a smile from romantic châtelaines, we have a crowd of princes and peasants, nobles and tradesmen; all, with their wives and mistresses, jostling and duping one another on a footing of perfect equality. Another sign that a new era has come is the mixed social condition of the 32 story-tellers; for among them, obscure and untitled men, probably domestics of the Duke of Burgundy, figure side by side with some of the greatest names in French history.

Centaurea, sĕn-tô'rē-a (commonly called BACHELOR'S-BUTTON, CORN-FLOWER, DUSTY-MILLER, or KNAPWEED), a genus of annual or perennial herbs of the natural order *Compositæ*. There are about 400 much confused species, mostly natives of western Asia and the Mediterranean region. A few are found in the western hemisphere, but only one, *C. americana,* in the United States. This species, popularly called basket-flower, is a very attractive hardy annual with rose-colored flowers. Many of the species are widely used in ornamental gardening. The following are among the most popular garden sorts: *C. cyranus,* the blue-bottle or corn-flower, common in European grain fields and frequently found wild in America. Its blue flowers yield a blue dye. *C. cineraria,* the dusty-miller, has white hairy leaves, and when grown as an edging plant — its most popular use — it is not allowed to flower. *C. moschata,* sweet-sultan, is widely grown for its large, fragrant flower-heads. *C. montana,* mountain bluet, which originally had blue flowers, has developed various other tints under cultivation. All the species are easily grown from seed and thrive in any good garden soil.

Centaurs, sĕn'tôrz, in Greek mythology, a fabulous race of people in Thessaly, on Mount Pelion. According to fable they sprang from the union of Ixion and a cloud. They are said to have been half horse and half man, and the fable is explained in this manner: The Centaurs first practised the art of mounting and managing horses. In the time of the Thessalian king Ixion a herd of wild bulls on Mount Pelion committed great devastations in the adjacent country. Ixion offered a reward to whoever should destroy them, in consequence of which the Centaurs trained horses for riding and slew the bulls. Mythology relates the combats of the Centaurs with Hercules, Theseus, and Pirithous. The latter, at the head of the Lapithæ, another Thessalian nation, their hereditary enemies, entirely defeated the Centaurs, killed many, and drove them from Pelion. The Centaurs, Nessus, Chiron, and others are famous in ancient fable. See CHIRON; DEJANIRA; HERCULES.

Centaurus, sĕn'tô-rŭs, or **The Centaur,** a southern constellation, only a small part of which rises in our latitude. Two stars of the first magnitude are catalogued in the portion which does not appear above our horizon. This is one of the 48 ancient constellations formed by Ptolemy, who first discovered the likeness of a centaur in it. On the celestial maps of the Arabs it is represented by a bear mounted on horseback.

Centaury, a genus of plants (*Erythræa*) of the natural order *Gentianaceæ,* of about 30 widely distributed species, mostly natives from western Asia to western Europe, of which two are of distinct ornamental merit. One of these (*E. venusta*) is from California; the other (*E. massoni*) from the Azores. They are hardy little annuals with rose-colored flowers, and are frequently planted in rockeries, in the soil of which the seeds may be sown in early spring. Some of the related species have been used to a small extent in domestic medicine, but rarely in regular medical practice. American centaury (*Sabbatia angularis*), of the same natural order,

CENTAUREA

is widely distributed in rich soil and sunny situations from western Canada to the Gulf States. It is often cultivated for its cymes of fragrant showy white or rose-colored flowers. Like the above, it has been used to a small extent in domestic medicine for simple ailments.

Centavo, thĕn-tä'vō, a Chilean coin equivalent to the cent (q.v.).

Cen'tenary, the commemoration of any event, as the birth of a great man, or the founding of a city or institution, which occurred 100 years before.
